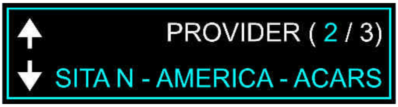
The VHF datalink provider was automatically selected, and is connected.

L12



PROVIDER (2 / 3)
SITA N - AMERICA - ACARS

The MAN SCAN function is active.
The flight crew can use the UP and DOWN keys on the RMP, to manually select a provider in the list.
When scrolling: if a provider is already connected , the PROVIDER header changes to ACTIVE PROVIDER, and the RMP displays “CONNECTED” as the status.

Ident.: DSC-23-20-38-00000221.0001001 / 30 APR 14

PROVIDER CONFIRMATION FUNCTION

: When there is no display indicates the AUTO SCAN function is active.

PROVIDER CONFIRM *	The MAN SCAN function is active, and the flight crew has manually selected a provider. To connect the provider, the flight crew should confirm the selection by pressing the associated Line Selection Key (LSK).

L1 In the illustration::

- VHF 1 is in transmission and reception mode, 118.775 MHz is the active frequency, and 125.465 MHz is the standby frequency
- VHF 2 is in reception mode only
- VHF 3 is neither in transmission nor reception mode
- The VHF 3 standby frequency is boxed to indicate that it is selected for modification
- The current squawk code is 2523.

Ident.: DSC-23-20-10-00000195.0001001 / 30 APR 14

LOUDSPEAKER SYMBOL

	When there is no display, indicates reception mode is off.
🔈	The active frequency is in reception mode.
L13	
🔇	The active frequency is in transmission mode, but not in reception mode. When the flight crew turns on the transmission mode only, the symbol flashes for 2 s, and then remains steady.

Ident.: DSC-23-20-10-00000196.0001001 / 30 APR 14

TRANSCEIVER IDENTIFICATION

VHF1	VHF 1(2)(3) is not in transmission mode.
VHF1	VHF 1(2)(3) is in transmission mode.

Ident.: DSC-23-20-10-00000197.0001001 / 30 APR 14

ACTIVE FREQUENCY

123.450	The VHF transceiver is tuned on the displayed frequency.
L12	
- - - . - - -	The VHF transceiver is in voice mode, and is either failed or not available. For information on possible failures: - *Refer to DSC-23-30-20 RMP Synchronization Failure* - *Refer to DSC-23-30-20 RMP - VHF/HF Transceiver Connection Failure*.

FOR VHF 3 ONLY

DATA	Data mode is active.
DISCONNECTING DATA	Data mode is disconnecting.

L12

The VHF transceiver is in data mode, and is either failed or not available.

For information on possible failures:
- *Refer to DSC-23-30-20 RMP Synchronization Failure*
- *Refer to DSC-23-30-20 RMP - VHF/HF Transceiver Connection Failure*.

Ident.: DSC-23-20-10-00000198.0001001 / 07 MAY 18

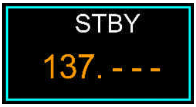
STANDBY (STBY) FREQUENCY

The standby frequency cannot be modified.

L12

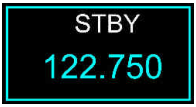
The VHF transceiver is in voice mode and is either failed, or not available. For an example of failure, *Refer to DSC-23-30-20 RMP Synchronization Failure*.

L12



The modified standby frequency is not a standard VHF voice frequency. The flight crew can clear the erroneous digits, via the CLR key, until the standby frequency displays in blue again.
The VHF 1(2) FREQ NOT VALID RMP message is also displayed.
For more information on this message, *Refer to DSC-23-20 VHF 1(2)(3)/HF 1 FREQ NOT VALID*.

FOR VHF 1 AND VHF 2 ONLY



When boxed, the standby frequency can be modified.

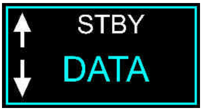
The standby frequency appears in :
- Big characters until it is validated by the flight crew, via the appropriate LSK
- Small characters after validation by the flight crew.

When entering a frequency, the system assists you and completes the digits of the frequency.

Note: *After a flight crewmember modifies a standby frequency, they should validate it, in order to prevent inadvertent modification of the frequency.*

FOR VHF 3 ONLY

L12



When boxed, the standby frequency can be modified.

The standby frequency (except DATA) appears in :
- Big characters until it is validated by the flight crew, via the appropriate LSK
- Small characters after validation by the flight crew.

Note: *After a flight crewmember modifies a standby frequency, they should validate it, in order to prevent inadvertent modification of the frequency.*

When entering a frequency, the system assists you and completes the digits of the frequency.
The up-arrow and the down-arrow indicate that the flight crew can use the up and down keys to scroll through the list of frequencies.

The list contains the following frequencies :
- DATA
- 121.500 MHz
- the modifiable frequency.

When the flight crew enters a frequency, via the numerical keypad, the modifiable frequency appears automatically whatever the current display.

Intentionally left blank

LOSS OF HF VOICE OR HF DATALINK

Ident.: DSC-23-25-00023781.0001001 / 08 NOV 18
Applicable to: ALL

DESCRIPTION

The HF system may not be able to correctly tune the selected frequency in VOICE or DATA mode. As a result, the COM HF 1(HF 2) FAULT (*Refer to procedure*) and the COM HF 1(HF 2) DATALINK FAULT (*Refer to procedure*) alerts can be triggered.
In this case, the HF system is not able to transmit or receive anymore, either in VOICE or in DATA mode. There is no sound in reception and no sidetone in transmission.

PROCEDURE

The flight crew can transmit on a new VOICE HF frequency in order to recover a normal operation of the system.

On any of the three RMPs:
- Change the affected HF1(HF2) frequency to a different VOICE frequency
- Transmit on this new frequency.

■ **If the HF communication is recovered:**
The alert disappears. The HF transmission and reception are recovered in both VOICE and DATA mode.

■ **If the HF communication is still inoperative:**
Voice or data communication remains available via VHF or SATCOM.

Intentionally left blank

Synchronization

A synchronization failure results in a partial display of the VHF, HF, and NAV pages on each RMP.

L3 In the above illustration of connection failure, RMP 1 does not share information related to VHF 1, VHF 3 and HF 1 with the two other RMPs. Therefore, RMP 1 synchronization is interrupted. Only RMP 2 and RMP 3 are synchronized.

L1 The displays on the TEL, SATCOM and DATALINK ROUTER pages are normal.

RMP - VHF/HF TRANSCEIVER CONNECTION FAILURE

Ident.: DSC-23-30-20-00000167.0001001 / 30 APR 14
Applicable to: ALL

In the case of a control connection failure between a RMP and a VHF/HF transceiver in voice mode, the RMPs continue to operate normally. However, the affected transceiver cannot be controlled and remains tuned to the pre-failure active frequency.
The flight crew detects the discrepancy only when a frequency change is attempted and feedback from Air Traffic Control (ATC) is not consistent.
If such failure occurs when VHF 3/HF 1 is in data mode, the transceiver automatically returns to the tune pre-failure standby frequency. Amber dashes replace DATA because the transceiver is in a mode (voice mode) that is not consistent with the mode commanded by the RMP (data mode).
L3 The ACR sends the VHF 3/HF 1 active mode information (voice or data) to the RMPs.
The illustration below shows an example of what happens when the connection, between an RMP and VHF 3/HF 1 fail.
In normal operation, a standby connection failure has no effect on the control of the VHF/HF transceivers.

AC POWER

Four engine generators (GEN 1A, GEN 1B, GEN 2B, and GEN 2A) and one APU generator (APU GEN) can provide AC 230 V power.
Two external power units (EXT 1, EXT 2) can provide AC 115 V power.

The normal AC electrical system has four Auto Transformer Units (ATU 1A, ATU 1B, ATU 2B, and ATU 2A). Each of these four ATUs converts:

- AC 115 V power into AC 230 V when the associated power source is an external power unit
- AC 230 V power into AC 115 V when the associated power source is an engine generator or the APU generator.

L2 For more information, *Refer to DSC-24-10-20 Overview*.

L1 DC POWER

Two Transformer Rectifiers (TR 1 and TR 2) provide Direct Current (DC) 28 V power from AC 230 V power.
Two emergency transformer rectifiers (TR EMER 1 and TR EMER 2) provide some DC 28 V power from AC 230 V power (AC EMER 1 and AC EMER 2).
In the event that AC power is not available, four batteries can also provide DC power (BAT 1, BAT 2, BAT EMER 1, and BAT EMER 2).

L2 For more information, *Refer to DSC-24-10-30 Overview*.

L1 EMER POWER

In emergency configuration:

- The RAT provide AC 230 V power
- Two emergency transformer units (ATU EMER 1, ATU EMER 2) provide AC 115 V power from AC 230 V power
- One DC Static Inverter (STAT INV) can also provide some AC 115 V power from DC 28 V power.

L2 For more information, *Refer to DSC-24-10-40 Static Inverter*.

L1 ELECTRICAL NETWORKS AND SUPPLY CENTERS

Electrical power is provided to:

- The normal AC and DC networks via:
  - 4 AC 115 V normal busbars (AC 1A, AC 1B, AC 2B, and AC 2A)
  - 4 AC 230 V normal busbars (AC 1A, AC 1B, AC 2B, and AC 2A)
  - 2 DC 28 V normal busbars (DC 1 and DC 2).
- The emergency AC and DC networks via:
  - 2 AC 115 V emergency busbars (AC EMER 1, and AC EMER 2)
  - 2 AC 230 V emergency busbars (AC EMER 1, and AC EMER 2)
  - 2 DC 28 V emergency busbars (DC EMER 1, and DC EMER 2).

L2 For more information, *Refer to DSC-24-10-50 Normal Network*.

ENGINE-DRIVEN GENERATORS

Each engine has two generators. These engine-driven generators are the primary sources of electrical power during normal operations. When an engine is running, its generators provide AC 230 V power at variable frequency.

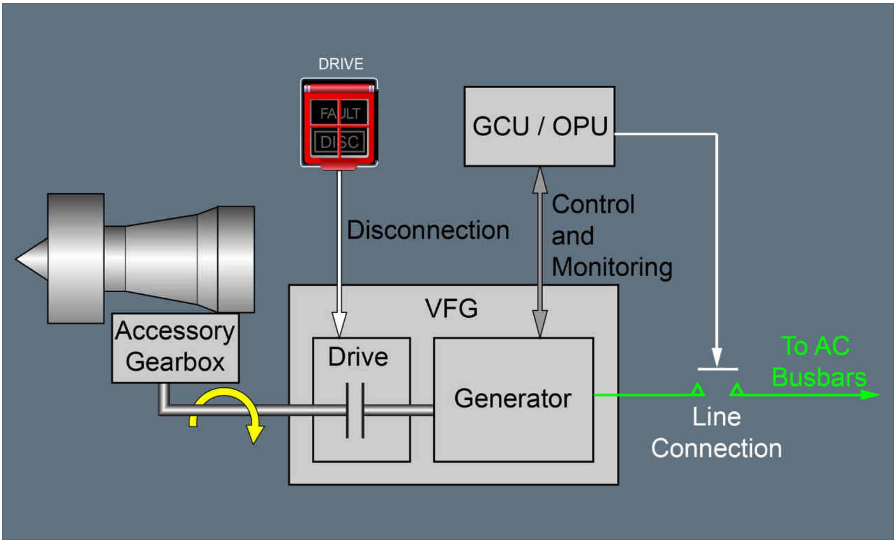
L3 This frequency ranges from 390 Hz to 800 Hz, depending on the N3 rotation speed of the engine.

An internal oil system lubricates and cools the engine generators.

L1 Each engine generator supplies AC power to its assigned AC busbar (e.g. GEN 1A supplies AC 1A).

L2 Each engine generator can supply up to 100 KVA.
There is one Variable Frequency Generator (VFG) and Generator Control Unit (GCU) / Overvoltage Protection Unit (OPU) per engine generator. Each GCU controls and monitors one generator.

Variable Frequency Generator



DRIVE
FAULT
DISC
GCU / OPU
Disconnection
Control
and
Monitoring
VFG
Accessory
Gearbox
Drive
Generator
To AC
Busbars
Line
Connection

L3 The GCU:
- Monitors the frequency of the generator
- Controls the voltage of the generator
- Detects the generator overloads
- Detects the oil low pressure and oil overtemperature.

The GCU transmits those informations to the ECAM as necessary.
The OPU is a redundant overvoltage protection.
The flight crew can manually disconnect the generator from the engine by the guarded DISC pb.

L2 For more information on the DISC pb, *Refer to DSC-24-20 DRIVE 1A(1B)(2B)(2A) pb*.

Ident.: DSC-24-10-20-10-00001786.0001001 / 03 DEC 15

APU GENERATOR

The APU is connected to one APU S/G. This equipment can be used either as a starter or as a generator. The generator provides AC 230 V power at a constant frequency of 400 Hz.

The APU generator can replace the function of any engine generator, on ground and in flight, in the operational envelope of the APU:
- On ground, the APU generator is able to supply the entire aircraft network
- In flight, the APU generator can replace up to 2 engine generators
  L2 For more information *Refer to DSC-24-40 In Flight with Two Generators on Same Side, and APU Running* and *Refer to DSC-24-40 In Flight with Two Generators on Opposite Side, and APU Running*.
- L1 In flight, if the entire normal AC network (AC 1A, AC 1B, AC 2B, and AC 2A busbars) is lost, the RAT will be deployed to recover the complete emergency AC network and the following rule is applicable for the APU:
  - In the case of an all engine failure (e.g. all engine flameout), the APU will automatically start and supply only side 1 (AC 1A and AC 1B busbars), or
  - In the case of failure of all engine generators (e.g. EMER ELEC configuration), the APU start must be considered and if available, the APU supply only side 1 (AC 1A and AC 1B busbars).

L2 For more information on the electrical configuration with the APU only, *Refer to DSC-24-30 On Ground with APU Running*.
The APU generator can supply up to 150 KVA on ground, and 100 KVA in flight.

The APU has one Starter Generator Control Unit (SGCU). The SGCU:
- Controls the frequency and voltage of the generator
- Detects the APU generator overloads.
  For more information, *Refer to DSC-49-10 APU Starter Generator System*.

Ident.: DSC-24-10-20-10-00013614.0001001 / 28 APR 14

AUTO TRANSFORMER UNITS

In normal operation, the Auto Transformer Units (ATUs) supply the AC 115 V network with power coming from the AC 230 V network.
The ATUs can also supply the AC 230 V network from the AC 115 V power in some configuration (e.g. power supply from external power unit in AC 115 V).

There are 6 ATUs:
- ATU 1A,
  L2 Transforms power from the AC 1A 230 V busbar to the AC 1A 115 V busbar
- L1 ATU 1B,
  L2 Transforms power from the AC 1B 230 V busbar to the AC 1B 115 V busbar

L1 - ATU EMER 1,
L2 Transforms power from the AC EMER 1 230 V busbar to the AC EMER 1 115 V busbar
L1 - ATU EMER 2,
L2 Transforms power from the AC EMER 2 230 V busbar to the AC EMER 2 115 V busbar
L1 - ATU 2B,
L2 Transforms power from the AC 2B 230 V busbar to the AC 2B 115 V busbar
L1 - ATU 2A.
L2 Transforms power from the AC 2A 230 V busbar to the AC 2A 115 V busbar.

Ident.: DSC-24-10-20-10-00001787.0001001 / 28 APR 14

EXTERNAL POWER UNITS

On ground, it is possible to connect as many as two external power units (EXT 1 and EXT 2).
One external power unit is sufficient to supply the entire aircraft network, but depending on the demand, some loads may be shed.

L2 The external power units supply the aircraft by providing AC 115 V power at a constant frequency of 400 Hz. Each external power unit can supply up to 90 KVA.
There is one External Power Control Unit (EPCU) per external power unit.

L3 The EPCU:
- Controls the frequency and voltage from the external power unit
  If the external power unit supplies more than 90 KVA, the EPCU automatically limits the power supply of the external power unit to 90 KVA
- Detects the external power unit overloads.

L1 GROUND SERVICING

Electrical power is available on ground to supply the ground service devices (e.g. cargo loading, cleaning, servicing, lighting).
In this configuration, the emergency electrical network is not power supplied, and only a part of the normal network used for ground operation is supplied.

In this configuration, the external power unit supplies only the following loads:
- Cabin and cockpit lighting
- Hydraulic compartment lighting
- Cargo compartment lighting and power outlets
- Landing gear compartment lighting and servicing power outlets
- Equipment compartment lighting and servicing power outlets
- Vacuum cleaner power outlets
- Cockpit servicing power outlets
- Fuel quantity indicators
- Navigation lights

- Parking brake
- Cargo door pumps.

L2 For more information, *Refer to DSC-24-20 Ground Service Control Panel*.

Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD

BATTERIES

The aim of the batteries is to provide DC 28 V electrical power to the aircraft:
- On ground, or
- When no AC power is available, or
- In flight in emergency conditions.

L2 Each battery has a capacity of 55 Ah.

L1 The batteries are not to be considered as the primary power source for DC network supply.

L2 Their essential purpose is:
- To ensure the No Break Power Transfer (NBPT) function
- To start the APU when no AC power is available
- Energize the DC network for specific ground operations with batteries only (refuel, maintenance, and towing).
  For more information, *Refer to DSC-24-30 On Ground with Batteries Only*.

L1 Batteries are connected to the DC network supplied by a transformer rectifier for charge.

The aircraft has four batteries:
- BAT 1
  L2 Supplies the DC 1 busbar
  L3 BAT 1 is permanently connected to HOTBUS 1.
- L1 BAT 2
  L2 Supplies the DC 2 busbar
  L3 BAT 2 is permanently connected to HOTBUS 2.
- L1 BAT EMER 1
  L2 Supplies the DC EMER 1 busbar
  L3 BAT EMER 1 is permanently connected to HOTBUS EMER 1.
- L1 BAT EMER 2.
  L2 Supplies the DC EMER 2 busbar.
  L3 BAT EMER 2 is permanently connected to HOTBUS EMER 2.

The systems connected to the HOTBUS bars remain supplied by their associated batteries even if the BAT pb is set to OFF.

L1 The charging, monitoring function and the interface with the aircraft are included directly in the battery.
In normal operation, BAT 1, BAT 2, BAT EMER 1, and BAT EMER 2 respectively connect to DC 1, DC 2, DC EMER 1, and DC EMER 2 busbars.

L2 NO BREAK POWER TRANSFER (NBPT)

If AC power is not available (TR 1 and TR 2 not operative), or during any source transfer, the DC 1 and DC 2 busbars are automatically connected to their corresponding batteries. As a result, the DC network is a No Break Power Transfer (NBPT) network.
The NBPT prevents busbar power interruption during source transfer. It is available on ground and in flight.

L3 The NBPT function only applies to the DC network, to which most avionics systems and all display units, are connected.

Ident.: DSC-24-10-30-10-00001789.0001001 / 28 APR 14
Applicable to: ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB

BATTERIES

The aim of the batteries is to provide DC 28 V electrical power to the aircraft:
- On ground, or
- When no AC power is available, or
- In flight in emergency conditions.

L2 Each battery has a capacity of 50 Ah.
L1 The batteries are not to be considered as the primary power source for DC network supply.

L2 Their essential purpose is:
- To ensure the No Break Power Transfer (NBPT) function
- To start the APU when no AC power is available
- Energize the DC network for specific ground operations with batteries only (refuel, maintenance, and towing).
  For more information, *Refer to DSC-24-30 On Ground with Batteries Only*.

L1 Batteries are connected to the DC network supplied by a transformer rectifier for charge.

The aircraft has four batteries:
- BAT 1
  L2 Supplies the DC 1 busbar
  L3 BAT 1 is permanently connected to HOTBUS 1.
- L1 BAT 2
  L2 Supplies the DC 2 busbar
  L3 BAT 2 is permanently connected to HOTBUS 2.
- L1 BAT EMER 1
  L2 Supplies the DC EMER 1 busbar
  L3 BAT EMER 1 is permanently connected to HOTBUS EMER 1.
- L1 BAT EMER 2.
  L2 Supplies the DC EMER 2 busbar.
  L3 BAT EMER 2 is permanently connected to HOTBUS EMER 2.

The systems connected to the HOTBUS bars remain supplied by their associated batteries even if the BAT pb is set to OFF.
L1 The charging, monitoring function and the interface with the aircraft are included directly in the battery.
In normal operation, BAT 1, BAT 2, BAT EMER 1, and BAT EMER 2 respectively connect to DC 1, DC 2, DC EMER 1, and DC EMER 2 busbars.

L2 NO BREAK POWER TRANSFER (NBPT)

If AC power is not available (TR 1 and TR 2 not operative), or during any source transfer, the DC 1 and DC 2 busbars are automatically connected to their corresponding batteries. As a result, the DC network is a No Break Power Transfer (NBPT) network.
The NBPT prevents busbar power interruption during source transfer. It is available on ground and in flight.

L3 The NBPT function only applies to the DC network, to which most avionics systems and all display units, are connected.

Ident.: DSC-24-10-30-10-00001790.0001001 / 28 APR 14
Applicable to: ALL

TRANSFORMER RECTIFIERS (TRS)

The Transformer Rectifiers (TRs) supply the DC network with a DC 28 V power from the AC 230 V power.

There are 4 TRs:
- TR 1
  L2 Transforms power from the AC 1A 230 V busbar, to supply the DC 1 busbar
- L1 TR EMER 1
  L2 Transforms power from the AC EMER 1 230 V busbar, to supply the DC EMER 1 busbar
- L1 TR EMER 2
  L2 Transforms power from the AC EMER 2 230 V busbar, to supply the DC EMER 2 busbar
- L1 TR 2
  L2 Transforms power from the AC 2A 230 V busbar, to supply the DC 2 busbar.

EMERGENCY GENERATION

GEN 2B

In the normal configuration, the AC 1B 230 V and AC 2B 230 V busbars respectively supply the AC EMER 1 230 V and AC EMER 2 230 V busbars.

The 230 V power is converted to:
- AC 115 V power by the ATU EMER 1 and ATU EMER 2
- DC 28 V on the DC EMER 1 and DC EMER 2 by the TR EMER 1 and TR EMER 2.

Ident.: DSC-24-10-40-10-00001791.0001001 / 02 APR 15
Applicable to: ALL

STATIC INVERTER

The static inverter powers the AC EMER 1 115 V busbar in the following cases:

- During RAT extension
- After landing with the RAT extended (emergency configuration), when the aircraft speed is less than 140 kt
- On ground during maintenance on batteries operations,
  L2 For more information on the maintenance on batteries configuration, *Refer to DSC-24-30 On Ground with Batteries Only*.
- L1 On ground, when no AC power source is available.

The static inverter transforms DC power from BAT EMER 1 into AC 115 V power at a constant frequency of 400 Hz.

Ident.: DSC-24-10-40-10-00013541.0003001 / 29 MAR 17
Applicable to: ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB

RAM AIR TURBINE (RAT)

If the AC 1A, AC 1B, AC 2B, and AC 2A busbars are lost in flight, the RAT extends automatically, and mechanically drives the emergency generator. This emergency generator supplies the AC EMER 1 and AC EMER 2 busbars with AC 230 V power at a variable frequency.
L3 This frequency ranges from 360 Hz to 800 Hz, depending on the rotation speed of the RAT.
L1 The emergency generator can supply all the electrical loads that are necessary for the remainder of the flight and for landing.
L2 For more information on the emergency configuration of the electrical system, *Refer to DSC-24-40 EMERGENCY configuration, With APU Running*.
The RAT is on the right hand side of the aft belly fairing, and supplies power, when the aircraft speed is 140 kt or above.
The RAT Generator Control Unit (GCU) monitors and controls the RAT.

L3 The RAT GCU:

- Monitors the frequency of the emergency generator
- Controls the extension of the RAT
- Controls the output voltage of the emergency generator.

Normal Network

Each engine generator connects to the electrical network via its assigned contactor.
The normal network is supplied via 8 AC busbars: AC 1A, AC 1B, AC 2B, and AC 2A, (four in AC 115 V and four in AC 230 V).

ETOPS 1(2) BUSBARS

The ETOPS 1 and ETOPS 2 busbars supply loads mandatory for ETOPS flights but not mandatory in emergency configuration. The AC 1A 115 V and 2A 115 V busbars supply the ETOPS busbars.
As soon as three engine generators are lost in flight (one side lost), the ETOPS busbar not power supplied is automatically supplied by the offside ETOPS busbar.

L2

DC SHED/GS 1(2)

The DC SHED/GS 1 and DC SHED/GS 2 busbars avoid supplying DC 28 V power loads that are not used during ground servicing. In all other configurations, those busbars are powered by the DC 1 and DC 2 busbars.

DC NORM/BAT 1(2)

The DC NORM/BAT 1 and DC NORM/BAT 2 busbars are used to supply DC 28 V power by the normal batteries for all load used during specific modes on ground (e.g. "refuel on batteries" or "towing on batteries"). In all other configurations, those busbars are powered by the DC 1 and DC 2 busbars.
For more information, *Refer to DSC-24-30 On Ground with Batteries Only*.

HOTBUS

The HOTBUS bars enable to power supply some equipments by the battery, even if the corresponding BAT pb on the overhead panel is set to OFF.
In this case, the corresponding DC busbar is not power supplied.

RAT

The emergency network is supplied:
- Via the AC 1B busbar, and
- Via the AC 2B busbar, or
- Directly from the RAT, if the AC 1A, AC 1B, AC 2B, and AC 2A busbars are lost.

L2 Even if there is another main power source (with APU running or engine restart), the RAT always and only power supplies the EMER busbars.

L3 As soon as RAT power is available, the EMER busbars are disconnected from normal AC power supply, and connected to the RAT power supply.

L1 If either AC 1B or AC 2B busbars is lost, the corresponding EMER busbar will be automatically supplied by the opposite side EMER busbar.

L2

EVAC

The DC EVAC 1 and DC EVAC 2 busbars supply power to the CIDS as soon as the EMER EXIT LT sw is set to ARM or ON position. This setting enables BAT EMER 1 and BAT EMER 2 to power the CIDS during an emergency evacuation when all BAT pb are set to OFF.

HOTBUS

The HOTBUS bars enable to power supply some equipments by the battery, even if the corresponding BAT pb on the overhead panel is set to OFF.
In this case, the corresponding DC busbar is not power supplied.

POWER CENTERS

All emergency load users side 1(2)
COMMERCIAL 1(2) pb-sw
OFF
Cabin and Cargo, non essential load users side 1(2)

The aircraft systems are supplied via the Electrical Power Distribution System (EPDS).
The EPDS has two Electrical Power Distribution Centers (EPDC), one for each side.

The main functions of the EPDC are:

- Electrical Network Management Function (ENMF): Management of the connection/disconnection of the power sources and control of the contactors to reconfigure the network
- Electrical Load Management Function (ELMF): Optimization of the load on the power sources availability.
- L2 Circuit Breaker Monitoring Function (CBMF): To monitor and store the status of each circuit breaker
- Power Distribution Maintenance Function (PDMF): Provides the maintenance operators with a secured access to the normal distribution centers.
- L3 Monitoring and protection of the ATU and of the external power unit.

L1 Each EPDC supplies power to the busbars located on the following distribution systems:

- The Primary Main Distribution: To supply electricity to all high load users (more than 15 A) of the normal network

  L2 The Primary Main Distribution supplies AC 230 V, AC 115 V, and DC 28 V power to the normal network
- L1 The Secondary Main Distribution: To supply electricity to essential low load users (less than, or equal to 15 A) of the normal network

  L2 The Secondary Distribution supplies AC 115 V, and DC 28 V power to the normal network
- L1 The Emergency Distribution: To supply electricity for all emergency loads

  L2 The Emergency Distribution supplies AC 230 V, AC 115 V, and DC 28 V power to the emergency network
- L1 The cabin and cargo non-essentials loads.

  L2 The EPDC supplies AC 230 V, AC 115 V, and DC 28 V power to the cabin and cargo non-essential network. The power supply can be disconnected by the COMMERCIAL 1(2) pb-sw.

Caption:
Possible busbars interconnection in case of reconfiguration

The EPDC is divided into two sides, side 1 and side 2.

Each side contains:
- A NORMAL network containing the normal AC and DC busbars and the normal battery
- An EMERGENCY network containing the emergency AC and DC busbars and the emergency batteries.

The engine generators supply the normal network that supplies the emergency network.
The emergency network can be autonomously power supplied by the RAT in case of EMERGENCY configuration.

In normal configuration:
- AC 1B and AC EMER 1 are interconnected
- AC 2B and AC EMER 2 are interconnected
- The other busbars are not interconnected.

In some specific cases, automatic reconfiguration can occur, and busbars can be interconnected:
- AC 1A, AC 1B, AC 2B, and AC 2A (115 V or 230 V) can interconnect
- AC EMER 1 230 V and AC EMER 2 230 V can interconnect
- DC 1 and DC 2 busbars can interconnect
- DC EMER 1 and DC EMER 2 can interconnect.

The flight crew can also modify the configuration (e.g. SMOKE, EMER CONFIG) by using the SIDE 1&2 ISOL pb-sw or the BUS TIE pb-sw on the overhead panel.

L2 For more information on the SMOKE configuration - SIDE 1&2 ISOL pb-sw, *Refer to DSC-24-40 SMOKE configuration - SIDE 1&2 ISOL pb-sw*.
For more information on the EMERGENCY configuration - BUS TIE pb-sw, *Refer to DSC-24-40 EMERGENCY configuration - BUS TIE pb-sw*.

ELECTRICAL LOAD AND NETWORK MANAGEMENT

Ident.: DSC-24-10-60-00001796.0001001 / 28 APR 14
Applicable to: ALL

ELECTRICAL LOAD MANAGEMENT FUNCTION (ELMF)

If a generator overload occurs, the ELMF will determine the exact value of the overload and will automatically shed the necessary commercial (non-essential) electrical loads.

L2 The ELMF manages shedding of the non essential loads.

These commercial loads are:
- Galleys
- Air conditioning recirculation fans
- Supplementary cooling system
- Floor panel heating
- Water and waste ice protection
- Lavatory and cabin lights
- Water heater
- Water pump
- Seat power supply.

L1 When sufficient power is recovered, connections restore automatically.
L2 The ELMF function is hosted in the CPIOM J (J71, J72).
L3 Any commercial high or low AC load can be shed.
The ELMF uses a criteria based on consumption priority to identify which loads to reconnect.
L2 If the ELMF is inoperative or failed, the ENMF manages the overload protection.
L3 The ENMFs will perform this function, on high commercial AC loads above 15 A (e.g. galleys).

L1 ELECTRICAL NETWORK MANAGEMENT FUNCTION (ENMF)

The Electrical Network Management Function (ENMF 1 and ENMF 2) controls the electrical networks by:
- Managing the connection of AC and DC power sources
- Ensuring power supply to busbars for essential load users during electrical reconfiguration due to generator loss. In this case, the ENMF sheds the appropriate load groups before system reconfiguration.
  L2 For more information on the electrical reconfigurations, *Refer to DSC-24-40 Reconfigurations Overview*.
- L1 Shedding groups of loads in the case of generators overload.
  L2 In the case of overload of a power source, if the ELMF shedding is not sufficient, the ENMF will automatically shed groups of high consumer loads
- L1 Triggering applicable MEMO, or information message on the ELEC SD page, in the case of load shedding.

L2 The ENMF function is hosted on the EPDC.

C/B MONITORING FUNCTION

Ident.: DSC-24-10-60-00012579.0001001 / 02 OCT 14
Applicable to: ALL

C/B MONITORING FUNCTION (CBMF)

The Circuit Breaker (C/B) monitoring functions (normal and emergency) are to:

- Identify the tripped C/Bs (conventional and RCCBs) that connect loads to the electrical network
- Display these tripped C/Bs on the C/B SD page.

Two types of Circuit Breakers (C/Bs) protect the electrical networks:

- Conventional C/Bs on the normal and emergency networks

L2 Conventional C/Bs connect:

  - High loads to the normal network
  - High and low loads to the emergency network.

L1 - Remote Control C/Bs (RCCB, SSPC) that act as self monitored contactors, on the normal network.

L2 RCCB connect low loads to the normal network.

L3 Low loads are on the secondary supply center or on the cabin supply centers.

C/B LIST PARTLY DISPLAYED

TRIPPED C/B IDENTIFICATION

The last tripped C/B is displayed at the top of the tripped C/B list.
The location and the Functional Identification Number (FIN) of the tripped C/B is for maintenance purposes only.

PAGINATION INDICATION

When there are more than 18 tripped C/Bs, a second page can be displayed and the pagination indication helps to know what page is displayed.

OVERPAGE MESSAGE

When there are more than 30 tripped C/Bs, this message appears to inform the flight crew that there are more tripped C/Bs than it can be displayed (a maximum of two pages are available).

Intentionally left blank

OVERVIEW

Ident.: DSC-24-30-00001848.0001001 / 28 APR 14
Applicable to: ALL

In normal operations, and before all engines are started, the electrical network automatically reconfigures to supply as many busbars as possible.

L2 This reconfiguration takes generator availability into account, and occurs according to the following priority rules:

1. One generator supplies a maximum of 2 main busbars
2. Each generator supplies its own busbar in priority
3. On ground, if only the APU is available, it supplies the entire electrical network
4. In flight, the APU cannot supply 2 different sides
5. In flight, the APU replaces in priority a lost generator on side 1, except if 2 power sources are lost on side 2
6. When 2 AC sources are available (engine generator or APU), the entire network is supplied. The electrical load is balanced between the 2 sides
7. It is not possible to have simultaneously more than 4 AC sources that supply the electrical network.

ON GROUND WITH BATTERIES ONLY

SPECIFIC BATTERIES MODES ON GROUND

On ground operation, with no electrical power source, the following ground configurations with batteries can be selected.

L2 The function operates if the batteries capacity is above 20 %. Below this value, the function will automatically disconnect.

L1 REFUEL ON BATTERIES

In normal conditions, the DC network supplies DC power to refuel the aircraft. If the normal network is not available, batteries (BAT 1 and BAT 2) can supply the electrical power for refuel operation.
The duration of the refuel on batteries is limited to 10 min (with nominal batteries capacity).

L2 For more information, *Refer to DSC-24-20 External Refuel Panel*.

L1 MAINTENANCE ON BATTERIES

If emergency network is not available, the emergency batteries (BAT EMER 1 and BAT EMER 2) are able to provide maintenance service to the aircraft for a limited duration.

L2 This function uses the Power Distribution Maintenance Function: PDMF, that can be activated via the ELEC REMOTE C/B CTL pb-sw.

For more information, *Refer to DSC-24-20 ELEC REMOTE C/B CTL pb-sw*.

L1 TOWING ON BATTERIES

In normal conditions, the DC network supplies the electrical power to the system required for towing (brakes, position lights, flight interphone, minimum flight deck lighting, and VHF). If normal network is not available, the towing is permitted on battery power only (BAT 1), for a limited duration.

L2 For more information, *Refer to DSC-24-20 TOWING ON BAT panel*.

ON GROUND WITH ONE EXTERNAL POWER UNIT

Ident.: DSC-24-30-00001850.0001001 / 28 APR 17
Applicable to: ALL

On side 2, the external power unit (EXT 2) supplies its onside busbars (AC 2B, and AC 2A) and the opposite side busbars (AC 1A, and AC 1B) with AC 115 V power.
The ATUs convert the AC 115 V power into AC 230 V power to supply the AC EMER 1 and 2 busbars.

GROUND SERVICING MODE

The ground servicing electrical network is supplied, when:
- One GND SVCE CTL sw is set to on
- At least one external power source is connected to the aircraft
- The ground servicing electrical network is not powered by any aircraft source.

In this configuration, the emergency electrical network is not supplied, and only a part of the normal network used for ground operation is supplied.

L3 There is no dedicated network to ground servicing on DC busbars. Ground servicing loads are installed on DC normal busbars.
Only the busbars 1A and 2A are supplied. Busbars 1B and 2B and the emergency network are not supplied.

In this configuration, the external power unit supplies only the following loads:
- Cabin and cockpit lighting
- Hydraulic compartment lighting
- Cargo compartment lighting and power outlets
- Landing gear compartment lighting and servicing power outlets
- Equipment compartment lighting and servicing power outlets

- Vacuum cleaner power outlets
- Cockpit servicing power outlets
- Fuel quantity indicators
- Navigation lights
- Parking brake
- Cargo door pumps.

L2 For more information on the GND SVCE CTL panel , *Refer to DSC-24-20 Ground Service Control Panel*.

RECONFIGURATIONS OVERVIEW

Ident.: DSC-24-40-00001858.0001001 / 02 OCT 14
Applicable to: ALL

In any abnormal electrical configuration (e.g. failure of one or more engine generators, TR failure, ATU failure), the electrical network automatically reconfigures to ensure that the remaining power sources continue to supply as many busbars as possible.

LOSS OF ONE POWER SOURCE

The different losses of one power source are:

- Loss of one engine generator and the APU is not available.

  The ELMF sheds the following loads:
  - Two galley feeders
  - Floor panel heaters
  - One recirculation fan
  - SCS system, one VCRU among two.

- Loss of one engine generator and the APU is available:
  The APU will supply the busbar of the lost generator, therefore no shedding is needed.
- Loss of one ATU.

  The ELMF sheds the following loads:
  - One galley feeder
  - Second galley feeder.

- Loss of one TRU:
  The ENMF performs the shedding function.

LOSS OF TWO POWER SOURCES

The different losses of two power sources are:

- Loss of two engine generators on opposite side:
  Both remaining generators supply its onside busbars.

  The ELMF sheds the following loads:
  - Two galley feeder
  - Floor panel heaters
  - One recirculation fan
  - SCS system, one VCRU out of three.

- Loss of two engine generators on the same side:
  The remaining side generators supply the opposite side busbars.
  The ENMF performs the shedding function.

- Loss of two generators on opposite sides and the APU is available:
  Priority is given to the segregation of sources. The remaining side 2 generator will supply its onside busbars. The APU will supply the busbar associated with the lost generator on side 1.
  The ELMF will consider the APU nominal power and will shed loads as applicable.
- Loss of two generators on the same side and APU is available:
  The APU will supply the two busbars associated with the lost generators.

  The ELMF sheds the following loads:
  - Two galley feeders
  - Floor panel heaters
  - One recirculation fan
  - SCS system, one VCRU out of three.

LOSS OF THREE POWER SOURCES

The different losses of three power sources are:
- Loss of three generators:
  The ENMF performs the shedding function.
- Loss of three engine generators and the APU is available:
  The remaining generator will supply the two onside busbars. The APU will supply the two offside busbars.
  The ELMF will consider the APU nominal power and shed loads as applicable.

FAILURE OF ALL ENGINE AND APU GENERATORS

The RAT will supply the emergency network.

IN FLIGHT WITH TWO GENERATORS ON SAME SIDE

Ident.: DSC-24-40-00012098.0001001 / 28 APR 17
Applicable to: ALL

The first generator of engine 2 (e.g. GEN 2A) supplies its assigned busbar (AC 2A) and the busbar AC 1B on side 1 with AC 230 V power.
The second generator of engine 2 (e.g. GEN 2B) supplies its assigned busbar (AC 2B) and the busbar AC 1A on side 1 with AC 230 V power.

Caption:
Possible busbars interconnection in case of reconfiguration
Interconnection not possible if SIDE 1 & 2 ISOL pb-sw set to ON

In the case of SMOKE procedure, the SIDE 1&2 ISOL pb-sw is pressed to ON.

In this case, several contactors operate to segregate the 2 sides of the EPDC:
- The side 1 and side 2 AC busbars are disconnected from each other
- L2 The AC busbars remain connected per side (AC 1A still connected to AC 1B and AC 2B still connected to AC 2A)
- L1 The normal DC 1 and DC 2 busbars are disconnected from each other (DC EMER 1 and DC EMER 2 busbars remain connected to each other).

L2 For more information on the SIDE1&2 ISOL pb-sw, *Refer to DSC-24-20 SIDE 1&2 ISOL pb-sw*.
L1 As soon as the flight crew pressed the SIDE 1&2 ISOL pb-sw, as per SMOKE procedure, the flight crew will shutdown the electrical side 1 then side 2, by setting OFF the corresponding generators.
L2 For more information about the [QRH] SMOKE procedure: *Refer to procedure*.
L1 On the following example, the 2 engine generators of side 1 (GEN 1A and GEN 1B) were set to OFF by the corresponding GEN pb-sw.

As a consequence the electrical configuration is the following:
- AC 1A, AC 1B, and AC EMER 1 busbars are lost
- DC 1 busbar is lost
- DC EMER 2 busbar supplies DC EMER 1 busbar.

BUS TIE
OFF
AUTO
Caption:
Possible busbars interconnection in case of reconfiguration
Interconnection not possible if BUS TIE pb-sw set to OFF

In the case of EMER CONFIG procedure, the BUS TIE is pressed to OFF.

In this case, several contactors operate to segregate:
- The normal AC busbars (AC 1A, AC 1B, AC 2B and AC 2A) from/to each other
- The normal DC 1 and DC 2 busbars from each other.

The emergency busbars are not segregated in that case to keep the emergency network powered by the RAT.

L2 For more information on the BUS TIE pb-sw, *Refer to DSC-24-20 BUS TIE pb-sw*.

L1 EMER CONFIG procedure comes on if all normal AC busbars are not power supplied (AC 1A, AC 1B, AC 2B, and AC 2A).

The RAT will automatically extend to power supply the AC emergency busbars (AC EMER 1 and AC EMER 2) with 230 V. The ATU EMER 1 and 2 will then convert the AC 230 V in AC 115 V for the same AC emergency busbars.

OVERVIEW

Ident.: DSC-25-10-00001925.0001001 / 02 OCT 14
Applicable to: ALL

The cockpit is designed for a two-member flight crew.

The aircraft and system controls are arranged in such a way that, when the pilots are seated in their normal flight configuration:
- Both flight crewmember are forward facing
- Both flight crewmember can monitor all instruments and systems
- Each flight crewmember can access and control all aircraft systems controls required to operate the aircraft.

In addition, the Forward Facing cockpit layout with the "Dark Cockpit" concept assists both crewmember to properly manage and monitor the various aircraft systems.
L2 For more information, *Refer to FCTM/AOP-10-20-30 Dark Cockpit Concept for Overhead Panel*.

L1 Most system controls are located on:
- The pedestal
- The main instrument panel
- The glareshield
- The overhead panel.

There are two adjustable seats for the flight crew and two seats at the rear of the cockpit for two additional occupants.

L12

Note: *This chapter describes the panels and equipment of the basic aircraft configuration, and may not correspond to the customized configuration of a specific aircraft.*

For more information on the installed equipment or panels:
- *Refer to the relevant chapter's system description*
- *Use the OPS Library INTERFACE SEARCH.*

FLIGHT CREW SEAT ADJUSTMENT

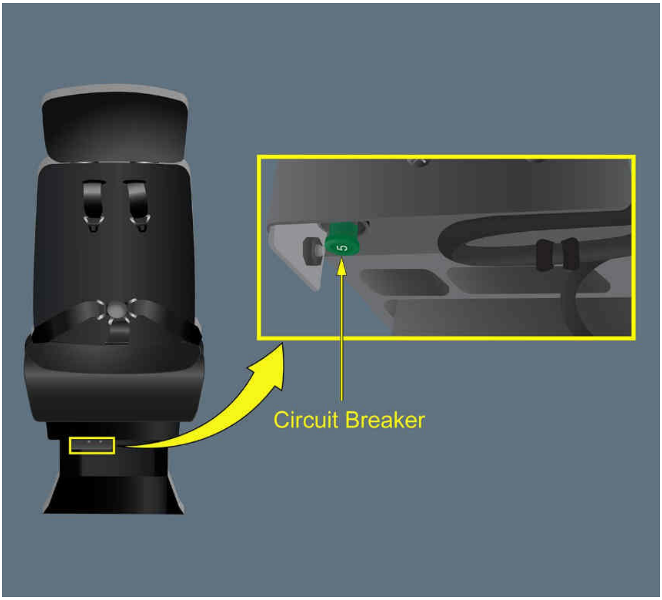
In order to electrically adjust the seat, the flight crew can press the horizontal or the vertical electrical controls in the desired direction.

As a backup, in order to mechanically adjust the seat, the flight crew can lift the horizontal or the vertical mechanical control handle.

In order to manually adjust the backrest position of the seat, the flight crew can lift the backrest recline mechanical control handle.

In order to adjust the depth and the vertical position of the lumbar rest, the flight crew turns the appropriate lumbar rest controller to the desired position.

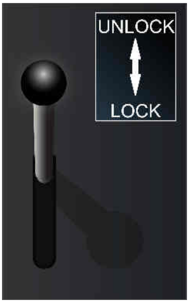
Note: *A circuit breaker is under the seat. When it is pulled, this circuit breaker stops the electrical power of the seat.*



HEADREST HEIGHT ADJUSTMENT

The flight crew can manually adjust the height of the headrest.

SHOULDER HARNESS LOCKING LEVER



In order to lock the shoulder harness position, the flight crew sets the shoulder harness lever to LOCK.

SIDESTICK ARMREST ADJUSTMENT

In order to adjust the position of the sidestick armrest, the flight crew:

- Turns the pitch adjustment knob to adjust the pitch of the sidestick armrest
- Turns the height adjustment knob to adjust the height of the sidestick armrest.

FLIGHT CREW REST COMPARTMENT

Ident.: DSC-25-30-10-00020593.0001001 / 02 OCT 14
Applicable to: ALL

DESCRIPTION

The Flight Crew Rest Compartment (FCRC) allow two flight crew members to relax during long-haul flights.
The FCRC must not be occupied during taxi, takeoff and landing, unless it has been fitted with the appropriate equipment.
For the description and operation of the FCRC, *Refer to CCOM/02-70-10 Flight Crew Rest Compartment - Introduction*.

EVACUATION

The primary evacuation path is the main entrance door of the FCRC.
When the main entrance is not usable, the evacuation is possible through an emergency hatch. For the description of the emergency hatch, *Refer to CCOM/02-70-30 Flight Crew Rest Compartment - Emergency Hatch*.

OVERVIEW

Ident.: DSC-26-10-00000089.0004001 / 07 JUL 16
Applicable to: ALL

The fire and smoke protection system includes:

- Fire and overheat detection for the following aircraft areas:
  - The engines (*Refer to Engine fire protection*)
  - The APU (*Refer to APU fire protection*)
  - The Main Landing Gear (MLG) bay (*Refer to MLG bay fire protection*).
- Smoke detection for the following aircraft areas:
  - The avionics bay (*Refer to Avionics bay smoke detection*)
  - The cargo compartments (*Refer to Cargo compartment smoke detection*)
  - The lavatories (*Refer to Lavatories smoke detection*)
  - The Flight Crew Rest Compartment ◁ (FCRC) and the Cabin Crew Rest Compartment ◁ (CCRC) (*Refer to FCRC and CCRC smoke detection*)
  - The IFE bay (*Refer to Cabin Systems Smoke Detection*)
  - The PAX BBAND bay ◁ (*Refer to Cabin Systems Smoke Detection*).
- Fire extinguishing for the following aircraft areas:
  - The engines (*Refer to Engine fire extinguishing*)
  - The APU (*Refer to APU fire extinguishing*)
  - The cargo compartments (*Refer to Cargo compartment fire extinguishing*)
  - The lavatories (*Refer to Lavatories fire extinguishing*).

In addition, the aircraft has portable fire extinguishers in the cockpit and in the cabin areas.

Intentionally left blank

FIRE PROTECTION SYSTEM

Ident.: DSC-26-20-00000091.0001001 / 18 APR 14
Applicable to: ALL

The Fire Protection System (FPS) monitors fire detection in:
- The engines
- The APU
- The MLG bay.

The FPS also manages fire extinguishing in:
- The engines
- The APU.

The FPS has:
- A Fire Protection Function (FPF)
- Detection loops in the sensitive areas
- Conversion Modules (CMs) which change the information from the detection loops into digital information usable by the FPF
- A fire extinguishing system.

The FPF has four independent channels.
L3 The CPIOMs J21, J22, J23 and J24 each host a FPF channel.
L1 In the case of a channel failure, the applicable dispatch message is triggered.

SMOKE DETECTION SYSTEM

Ident.: DSC-26-20-00000090.0001001 / 18 APR 14
Applicable to: ALL

The Smoke Detection System (SDS) includes:
- Smoke detectors in several areas of the aircraft
- A Smoke Detection Function (SDF) with two independent and redundant channels.

L2 One channel is active at a time, the other is on stand-by.

L1 The Smoke Detection Function (SDF) is a part of the Cabin Intercommunication Data System (CIDS). The SDF monitors the information sent by the smoke detectors

The SDF:
- Monitors the information sent by the smoke detectors
- In the case of a detection of smoke, sends applicable information to the ECAM and the Flight Attendant Panel (FAP)
- Manages the fire extinguishing system of the cargo compartments.

In the case of a SDF loss, the SMOKE DET FAULT ECAM alert is triggerred.

L2 For more information on the SMOKE DET FAULT ECAM alert, *Refer to procedure*.

L1 In the case of a SDF channel failure, the applicable dispatch message is triggered.

FIRE DETECTION

The Fire Protection System (FPS) uses two identical loops (A and B) to monitor the sensitive zones.

L2 The sensitive zones of the engines are the:
- Fan compartment
- Intermediate compressor compartment
- Core compartment / Pylon.

L3 The above zones are protected, because they are heat sensitive zones in which a fire could potentially start.

L1 Each loop has a fire detector for each sensitive zone.
The Fire Protection Function (FPF) receives information from the two loops. The FPF provides information to the ECAM to generate applicable fire warnings or loop cautions.

L3 For each engine, two different FPF channels compare the information that they receive from both loops.

L1 When fire is detected in an engine:
- The continuous repetitive chime sounds
- The MASTER WARN lights flash
- The associated ENG FIRE alert is triggered
- The SD displays the ENG SD page
- On the FIRE panel, the assigned FIRE light comes on
- On the ENG MASTER panel, the assigned FIRE light comes on.

Ident.: DSC-26-30-10-10-00000653.0001001 / 03 SEP 14

L2 FIRE DETECTION AND LOOP FAULT LOGIC

If the loops detect either a fire, or a fault, the following alert(s) or dispatch message(s) are triggered:

Detection on LOOP A		Detection on LOOP B		Alert / Dispatch Message
Fire	**Fault**	**Fire**	**Fault**	
Yes	No	Yes	No	ENG 1(2) FIRE
No	Yes	Yes	No	ENG 1(2) FIRE
Yes	No	No	Yes	ENG 1(2) FIRE
No	Yes	No	Yes	ENG 1(2) FIRE On the same engine: If one failure occurs after the other, within 5 s.
				ENG 1(2) FIRE DET FAULT On the same engine: If one failure occurs after the other, at an interval of more than 5 s.
No	Yes	No	No	Applicable dispatch message. If a failure is detected in one loop, the other loop is not affected and continues to operate. Therefore, fire detection remains available.
Yes	No	No	No	
No	No	Yes	No	
No	No	No	Yes	

EXTINGUISHING

Ident.: DSC-26-30-10-00000302.0001001 / 18 APR 14
Applicable to: ALL

The flight crew can isolate and extinguish an engine fire via the FIRE panel in the cockpit.

ENGINE ISOLATION

In case of engine fire, the flight crew can press the assigned ENG FIRE pb-sw to isolate the affected engine.

L2 When pressed, the system:

- Stops the aural fire warning
- Arms the squibs on the fire extinguishers
  The fire extinguisher bottles are ready to discharge.
- Closes the low-pressure fuel valve
- Closes the hydraulic fire shutoff valve
- Closes the engine bleed valve
- Closes the pack flow control valve
- Shuts off the FADEC power supply.

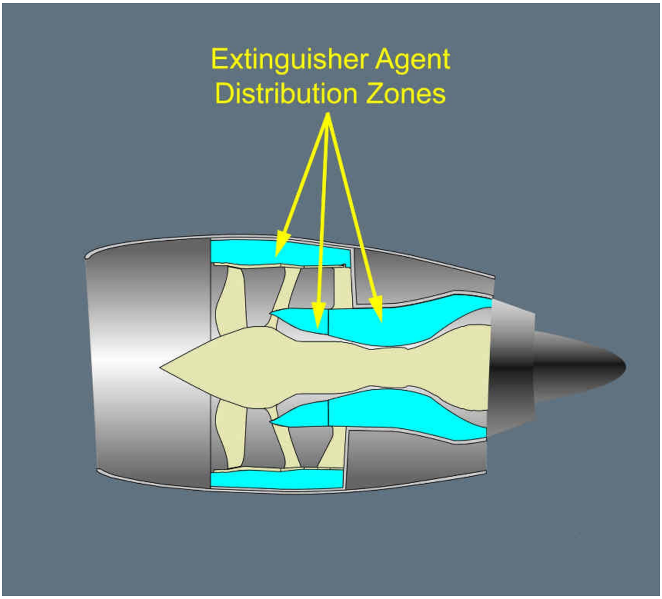
L1 FIRE EXTINGUISHING

Each engine has two fire extinguisher bottles.

L3 Each extinguisher bottle has two squibs that enable the discharge of fire extinguisher agent.

L1 After isolating the affected engine, the flight crew can discharge the extinguisher bottles with the assigned AGENT pb.

Extinguisher Agent - Distribution Zones



L3 The fire extinguisher can be discharged if:
- At least one fire extinguisher squib is operational, and
- There is sufficient pressure in the bottle.

L1 In the case of a failure of a component of the fire extinguishing system, the applicable dispatch message is triggered.

L2 FIRE DETECTION AND LOOP FAULT LOGIC

If the loops detect either a fire, or a fault, the following alert(s) or dispatch message(s) are triggered:

Detection on LOOP A		Detection on LOOP B		Alert / Dispatch Message
Fire	**Fault**	**Fire**	**Fault**	
Yes	No	Yes	No	APU FIRE
No	Yes	Yes	No	APU FIRE
Yes	No	No	Yes	APU FIRE
No	Yes	No	Yes	APU FIRE If one failure occurs after the other, within 5 s.
				APU FIRE DET FAULT If one failure occurs after the other, at an interval of more than 5 s.
No	Yes	No	No	Applicable dispatch message. If a failure is detected in one loop, the other loop is not affected and continues to operate. Therefore, fire detection is still available.
Yes	No	No	No	
No	No	Yes	No	
No	No	No	Yes	

EXTINGUISHING

Ident.: DSC-26-40-10-00000355.0001001 / 07 JAN 16
Applicable to: ALL

The flight crew can isolate and extinguish an APU fire from the FIRE panel in the cockpit.

APU ISOLATION

In case of APU fire, the flight crew can press the APU FIRE pb-sw to isolate the APU.

L2 When pressed, the system:
- Shuts down the APU
- Stops the aural warning
- Arms the squibs on the fire extinguisher
  The fire extinguisher bottle is ready to discharge.
- Closes the low-pressure fuel valve
- Shuts off the APU fuel pumps
- Closes the APU bleed valve and crossbleed valve
- Closes the APU isolation valve
- Deactivates the APU generator.

L1 FIRE EXTINGUISHING

The APU has one fire extinguisher bottle.

L3 The extinguisher bottle has two squibs that enable the discharge of fire extinguisher agent.

L1 After isolating the APU, the flight crew can discharge the extinguisher bottle with the APU AGENT pb.
On ground, the FPF automatically discharge the extinguisher bottle.

L3 The fire extinguisher agent can be discharged if:
- At least one fire extinguisher squib is operational, and
- There is sufficient pressure in the bottle.

DETECTION

Applicable to: ALL

Ident.: DSC-26-60-10-10-00000371.0001001 / 29 OCT 14

GENERAL

The avionics bay has a Smoke Detection System (SDS).

The SDS has:
- Smoke detectors

L2 The SDS monitors the:
- Left (L) avionics ventilation circuit
- Right (R) avionics ventilation circuit.

Each avionics ventilation circuit has two smoke detectors. They are in the air extraction ducts.

L1
- A Smoke Detection Function (SDF).

The SDF monitors the information received from the detectors of a specific avionics ventilation circuit. The SDF provides information to the ECAM to generate applicable smoke warnings, or detector fault cautions.

SMOKE DETECTION

Applicable to: ALL

Ident.: DSC-26-70-10-10-00000389.0001001 / 03 SEP 14

DETECTION

The Smoke Detection System (SDS) has:

- Smoke detectors in the forward and aft/bulk cargo compartments

L2 These detectors are in cavities within the ceiling panels. Each cargo compartment cavity has two detectors. There are:
  - Four cavities in the forward cargo compartment
  - Four cavities in the aft/bulk cargo compartment, one of which is in the bulk cargo compartment.

L1
- A Smoke Detection Function (SDF) that monitors the information received from the detectors of a given compartment. The SDF provides information to the ECAM to generate applicable smoke warnings, or detector fault cautions.

If smoke is detected in a cargo compartment, the associated SMOKE alert are triggered.
If smoke is detected in a cargo compartment, the ventilation automatically stops.

L3 Therefore:

- The isolation valves close
- The extraction fan stops.

DETECTION LOGIC

The SMOKE FWD(AFT/BULK) CARGO SMOKE alert is triggered if, in the forward(aft/bulk) cargo compartment:
- Both detectors in one cavity detect smoke, or
- One detector detects smoke and the other detector of the same cavity is failed.

L2 For more information on the SMOKE FWD CARGO SMOKE ECAM alert, *Refer to procedure*.
For more information on the SMOKE AFT/BULK CARGO SMOKE ECAM alert, *Refer to procedure*.

L1 The SMOKE FWD(AFT/BULK) CARGO DET FAULT alert is triggered if both detectors fail in one cavity of the forward(aft/bulk) cargo compartment.

L2 For more information on the SMOKE FWD CARGO DET FAULT ECAM alert, *Refer to procedure*.
For more information on the SMOKE AFT/BULK CARGO DET FAULT ECAM alert, *Refer to procedure*.

L1 In the case of a failure, the applicable dispatch message is triggered.

FIRE EXTINGUISHING

Ident.: DSC-26-70-10-00000390.0001001 / 26 JUL 17
Applicable to: ALL

The fire extinguishing system ensures that a sufficient concentration of extinguisher agent is maintained in the affected cargo compartment, for a duration that depends on the installed configuration of the fire extinguisher bottles. A sufficient concentration of extinguisher agent extinguishes or suppresses the fire by depriving the fire of oxygen.
There are two fire extinguisher bottles that can discharge extinguisher agent in the forward or aft/bulk cargo compartment.

When the fire extinguisher bottles discharge, the agent protects the affected cargo compartment against fire for:
- 195 min, or
- 290 min ◁ , or
- 360 min ◁ .

Flow Metering System
Diverter Valve

When the flight crew presses the assigned push-button, the extinguisher agent is released into the affected cargo compartment.

L3 A diverter valve directs extinguisher agent to either the forward or aft/bulk cargo compartment.

L2 The bottles discharge as follow:

- Bottle 1 first discharges extinguisher agent in the affected cargo compartment. This takes approximately 1 min.

  L3 Bottle 1 is emptied in order to have a sufficient concentration of extinguisher agent in the affected cargo compartment.

- L2 Bottle 2 then slowly discharges extinguisher agent, to provide sufficient extinguisher agent concentration in the affected cargo compartment until the end of the flight.

  L3 A flow-metering system regulates the flow of extinguisher agent.

LAVATORY SMOKE DETECTION

Applicable to: ALL

Ident.: DSC-26-80-10-10-00000416.0001001 / 18 APR 14

Each lavatory has a Smoke Detection System (SDS).

Each SDS has:
- A smoke detector next to the air extraction vent
- A Smoke Detection Function (SDF).

If the SDF detects smoke in any lavatory, the SMOKE LAVATORY SMOKE ECAM alert is triggered, and the Flight Attendant Panel (FAP) displays an associated cabin smoke alert.

L2 For more information on the SMOKE LAVATORY SMOKE ECAM alert, *Refer to PRO-ABN-SMOKE SMOKE LAVATORY SMOKE*.

L1 In the case of a failure of the lavatory SDS, the SMOKE LAVATORY DET FAULT ECAM alert and the applicable dispatch messages are triggered.

L2 For more information on the SMOKE LAVATORY DET FAULT ECAM alert, *Refer to procedure*.

OVERVIEW

Ident.: DSC-27-10-10-00001992.0001001 / 06 MAY 15
Applicable to: ALL

The flight control system is a fly-by-wire system.

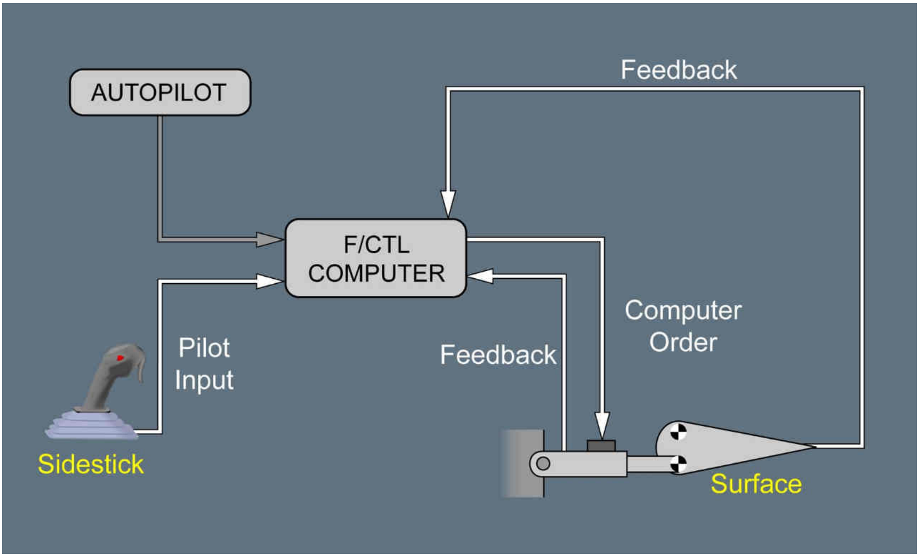
The flight control surfaces are:
- Electrically controlled
- Hydraulically actuated.

L2 The surfaces are actuated by one or both hydraulic systems, or by an independent hydraulic source (EHA/EBHA).*Refer to DSC-27-10-10 EHA / EBHA*.

Note: The slats also have an electrical motor.

L1 The stabilizer has two electric motors.

The PF uses the sidestick to manually fly the aircraft. The flight control computers interpret the pilot's inputs, and order flight control surface movement, as necessary.
Additionally, a PITCH TRIM sw and a RUDDER TRIM selector (with a rudder trim RESET pb) enable the pilot to trim the aircraft when needed.



In normal law, regardless of the pilot's input, the flight control computers prevent excessive maneuvers and any exceedance of the safe envelope in pitch, roll and yaw.

FLIGHT CONTROL COMPUTERS

Ident.: DSC-27-10-10-00001994.0001001 / 24 APR 14
Applicable to: ALL

Six flight control computers process pilot and autopilot inputs:
- 3 PRIMs
- 3 SECs

One computer of any type (PRIM or SEC) is able to control the aircraft and ensure safe flight and landing.

L2 In normal operation, one PRIM computer is the master (usually PRIM 1) and computes the orders. The master computer sends orders to the other computers (PRIMs and SECs) which execute them on their associated actuators.
Each flight control actuator is connected to one PRIM and one SEC. In normal operation, the PRIMs control the actuators. In the case of impossibility for the PRIM to control its actuators, the associated SEC takes over.

PRIM

The three PRIMs:
- Compute Normal, Alternate, and Direct control laws
- Command the flight control surfaces : ailerons, spoilers, elevators, THS and rudder
- Compute the Load Alleviation Function (LAF) law

- Host the autopilot, flight director and autothrust functions. For more information, *Refer to Flight Guidance*
- Host the flight envelope protection functions
- Compute the characteristic speeds
- Host various other functions, described in their relevant chapters, out of which:
    - Brake to Vacate (BTV). For more information, *Refer to BTV*.
    - ROW and ROP functions. For more information, *Refer to ROW/ROP*.
    - The inhibition function of the thrust reversers (Third line of defense). For more information: *Refer to DSC-70-10-70-20 Three Lines of Defense*

L2 The PRIMs receive information from the following aircraft systems.

ADIRU

Each PRIM receives data from the three Air Data and Inertial Reference Units (ADIRUs).

L3 Each ADIRU has two parts:
- The Air Data Reference (ADR)
- The Inertial Reference (IR)

When the three IR (ADR) are valid, the used parameter is the median value.
When two IR (ADR) are valid, the used parameter is the average of both outputs.
When only one IR is valid, its data is not used. When only one ADR is valid, its parameters are used, if monitored by the ISIS.

In addition, a fourth AOA is used by the PRIMs in order to:
- Monitor the remaining MFPs in the case of an ADR failure
- Provide additional AOA data order to increase the availability of the flight control laws
- For more information: *Refer to DSC-34-NAV-20-10-20 Architecture*

ISIS

There is one Integrated Standby Instrument System (ISIS). The ISIS uses probes which are independent from the ADIRUs probes.
Each PRIM receives data from the ISIS to monitor the ADIRUs. For more information:*Refer to DSC-34-NAV-20-10-50 ADIRS Monitoring*.
The PRIMs do not use data from the ISIS to compute flight control laws.

L2 **RA**

Each PRIM receives data from the three Radio Altimeters (RAs).
L3 Each PRIM is connected to two RAs and receives third RA data via the other PRIMs.
When the three RAs are valid, the used parameter is the median value.
When two RAs are valid, the used parameter is the average of both outputs.
When only one RA is valid, its value is used.

L2 **FQMS**

The Fuel Quantity and Monitoring System (FQMS) provides the weight and centre of gravity data to the PRIMs.

L3 FQMS 1 sends the weight and CG information to the PRIMs. FQMS 2 takes over if FQMS 1 fails.

L2 **LGERS / BCS**

The Landing Gear Extension Retraction System (LGERS) provides:
- Compressed/not compressed landing gear information
- Extended/retracted landing gear information
- L/G lever position.

The Braking Control System (BCS) provides:
- Wheel speed information
- Brake pedals position.

SFCC

The Slats and Flaps Control Computers provide the slats and flaps position, and FLAPS lever position. For more information: *Refer to DSC-27-20-10 Slat(Flap) Systems*

L3 Any SFCC can provide the position of all the slats and flaps.

ACCELEROMETERS AND GYROMETERS

Several Rate Gyrometer and Accelerometer Units (RGAU) provide information for the computation of the flight control laws:
- Roll rate
- Pitch rate
- Yaw rate
- Longitudinal acceleration
- Lateral acceleration
- Normal acceleration.

HYDRAULIC SENSORS

The hydraulic sensors provide the status of the hydraulic systems and engine driven pumps. This enables flight control reconfiguration in case of hydraulic low pressure, or if only one pump remains available for one system.

Ident.: DSC-27-10-10-10-00002002.0001001 / 24 APR 14

SEC

The three SECs:
- Compute the direct control law when the three PRIMs are failed,
- Control surfaces (ailerons, spoilers, elevators, THS and rudders) in backup to the PRIMs,
- Control the rudder trim (SEC 2 and SEC 3 only).

L2 The SECs receive the same information as the PRIMs from the following systems:
- ADIRU

L3 Each SEC receives data from two ADIRUs:
  - SEC 1 receives data from ADIRUs 1 & 2. In addition SEC 1 receives data from ADIRU 3 via SEC 2 and SEC 3
  - SEC 2 receives data from ADIRUs 2 & 3
  - SEC 3 receives data from ADIRUs 1 & 3.

L2
- SFCC
- LGERS
- FQMS
- RA
- BCS
- Hydraulic sensors.

L3 The direct law, hosted by the SECs, is more simple than the normal and alternate laws, and requires less parameters. Therefore, the SECs are less affected by other aircraft system failures. For more information: *Refer to DSC-27-10-40 Direct Law*

Ident.: DSC-27-10-10-10-00002003.0001001 / 24 APR 14

FLIGHT CONTROL DATA CONCENTRATOR (FCDC)

The two FCDCs acquire data from the PRIMs and SECs for:
- The F/CTL system display
- The Flight Warning System
- L3 The on-board maintenance system
- The flight data recorders
- L1 Weight and Balance Backup Computation (WBBC) which provides backup weight and CG data.

L3 The data from the WBBC is used for flight control law and characteristic speed computation in case of a dual FQMS failure, and to detect any major discrepancy between the FQMS and the WBBC. For more information on the WBBC: *Refer to DSC-28-10 Weight and Balance Backup Computation*

The FCDCs are hosted in the CPIOM-J7 (J71 and J72). For more information: *Refer to DSC-42-10 CPIOM Group J7*

Ident.: DSC-27-10-10-10-00002004.0001001 / 24 APR 14

BACKUP CONTROL MODULE (BCM)

In the event of the temporary loss of all flight computers (PRIMs and SECs), the Backup Control Module (BCM) provides aircraft control and stability. For more information : *Refer to DSC-27-10-40 Backup Control*.

Ident.: DSC-27-10-10-10-00002005.0001001 / 24 APR 14

PEDAL FEEL AND TRIM UNIT (PFTU)

The PFTU has two motors (one controlled by SEC 3, the other controlled by SEC 2) to move the zero-force position of the rudder pedals:

- For rudder trim, in manual flight
- To reflect autopilot rudder trim orders, when the autopilot is engaged.

L3 The autopilot rudder trim orders are sent from the PRIM to the PFTU, via the SEC.

EHA / EBHA

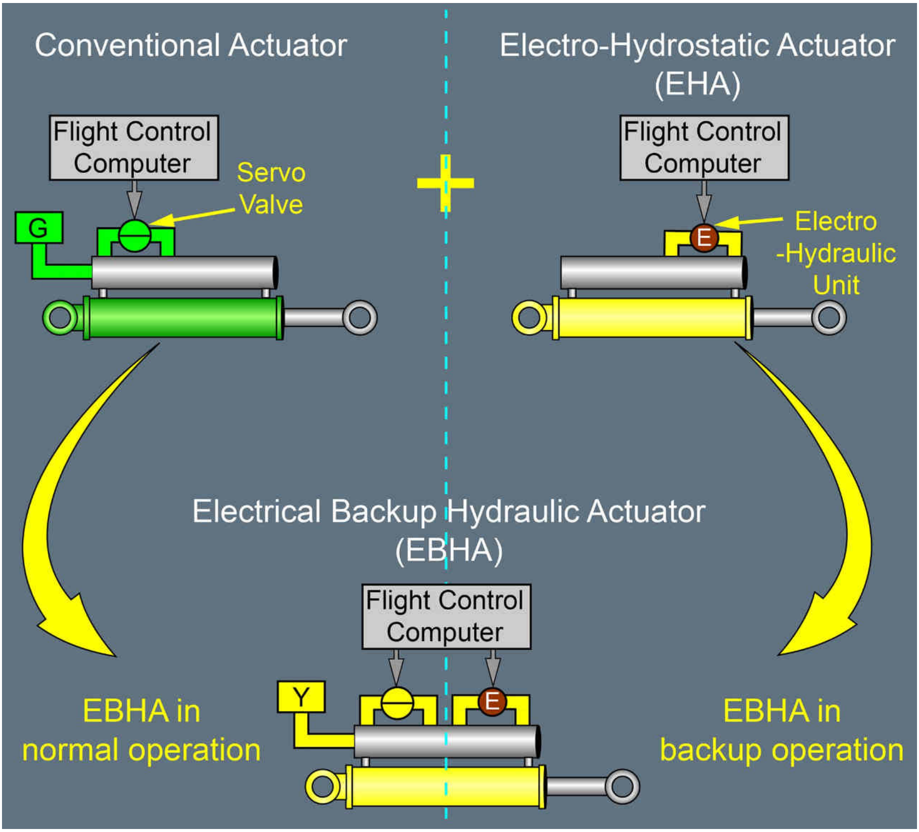
Ident.: DSC-27-10-10-10-00002000.0001001 / 04 MAY 16
Applicable to: ALL

On most civil aircraft, there are at least three hydraulic systems, to ensure sufficient redundancy for flight controls and landing gear systems.
On the A350, to reduce the aircraft weight and maintenance costs, there are only two hydraulic systems. Equivalent redundancy is achieved with electro-hydraulic actuators.
Electro-hydraulic actuators use electrical power to locally generate their own hydraulic pressure to move a flight control surface. Each electro-hydraulic actuator has its own self-contained hydraulic reservoir.

There are two types of electro-hydraulic actuators:

- Electro-Hydrostatic Actuators (EHA)	:	Powered by one electric system
- Electrical Backup Hydraulic Actuators (EBHA)	:	Powered by one electric or one hydraulic system.

EHA / EBHA



Conventional Actuator
Electro-Hydrostatic Actuator (EHA)
Flight Control Computer
Servo Valve
G
Flight Control Computer
E
Electro -Hydraulic Unit
Electrical Backup Hydraulic Actuator (EBHA)
Flight Control Computer
Y
E
EBHA in normal operation
EBHA in backup operation

ELECTRO-HYDROSTATIC ACTUATOR (EHA)

Each surface has one, two, or three actuators. When EHAs are installed, they are the backup to the conventional actuator.

Each EHA has:
- Its own hydraulic reservoir
- An electric hydraulic pump
- A hydraulic actuator.

L2 On ground, when hydraulic power is available, the reservoir of the EHA is automatically refilled, if needed. The hydraulic fluid is taken from the hydraulic systems (green or yellow).

L1 The following surfaces are fitted with an EHA:
- Inner ailerons,
- Rudder,
- Elevators.

ELECTRICAL BACKUP HYDRAULIC ACTUATOR (EBHA)

The EBHA is a combination of a conventional actuator and of an EHA.
When hydraulic power is available, the EBHA behaves like a conventional actuator.
When hydraulic power is lost, the EBHA behaves as an EHA.

Each EBHA has:
- A servo valve for the hydraulic mode
- An electric hydraulic pump for the electric mode
- Its own hydraulic reservoir for the electric mode

L2 *Note:* *The reservoir is filled when hydraulic power is available.*

L1
- A hydraulic actuator.

L2 In electric mode, the EBHA is isolated from the hydraulic system.
L1 Only the pair of spoiler 5 is fitted with an EBHA.

PITCH CONTROL

Ident.: DSC-27-10-10-00001996.0001001 / 18 JUN 15

L2 *Note: In the event of an all engine flameout, all EHAs are powered via the 230 V AC EMER 2 busbar.*

L1 ELEVATORS

L3 The maximum elevator deflection is 20 ° down and 30 ° up.

L1 Each elevator has:
- One conventional actuator which is active (it commands the position of the surface)
- One EHA which is in damping mode (it follows the movement of the surface).

L3 Both actuators can be simultaneously active, when a high surface deflection rate or a high force to deflect the surface is required.

L1 **CONTROL**

Only one flight control computer per elevator is active. The others are in stand-by.

L2 When all systems are operative:
- PRIM 1 controls the left-hand elevator
- PRIM 3 controls the right-hand elevator

L1 If a PRIM or a hydraulic system fails, another flight control computer and power source will take over, to ensure maximum elevator availability.
L2 For example: for the left-hand elevator, if PRIM 1 or the green hydraulic system fails, PRIM 2 and the EHA on the AC EMER 2 busbar will takeover.
L1 Both elevators remain available in backup control (*Refer to DSC-27-10-40 Backup Control*).

TRIMMABLE HORIZONTAL STABILIZER (THS)

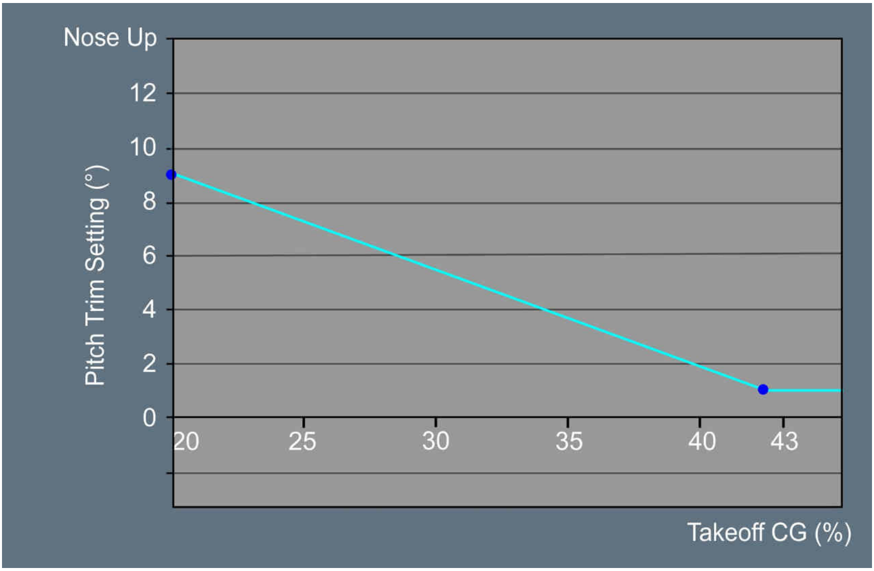
L3 The maximum THS deflection is between 0.8 ° and 13.7 ° nose up.
L1 The THS has two electric motors, a screwjack and a ball nut.
In normal operations, one motor is active, the other one is in stand-by mode. The active motor is switched after each flight to avoid motor wear.
On ground, or in direct law, the THS is directly controlled via the pitch trim switch.
In flight, in normal and alternate law, the THS is controlled by the flight control computers.

AUTOMATIC PITCH TRIM SETTING

The pitch trim is automatically set for takeoff:
- When the first engine is started, or
- When the flight crew arms the ground spoilers.

The pitch trim setting for takeoff is function of the takeoff CG.

Green Band



The takeoff CG used for the pitch trim setting is provided by the FQMS, based on the ZFCG entered by the flight crew in the FMS Fuel & Load page, and on the fuel distribution. It is displayed in the permanent data of the system display.

L2 *Note: In the TAKEOFF panel of the FMS PERF page, the flight crew enters the THS position for takeoff, based on the takeoff CG of the loadsheet. This input is not used for automatic pitch trim setting. It is used to trigger the F/CTL PITCH TRIM/FMS/CG DISAGREE caution, if necessary (For more information: Refer to PRO-ABN-F_CTL F/CTL PITCH TRIM/FMS/CG DISAGREE).*

During a touch and go, the pitch trim will automatically move to the takeoff position, based on the aircraft CG.

L3 The pitch trim will move when:
- Main landing gears are compressed for at least one second
- Aircraft speed is above 80 kt
- One of the following action is performed:
  - Slats/flaps are moved
  - Ground spoilers are disarmed
  - At least one thrust levers is not at idle.

L2 *Note: After landing, the pitch trim will move to 0,8° (maintenance position) when the speed goes below 30 kt.*

L1 **CONTROL**

Only one flight control computer is active. The other is in stand-by.

L2 When all systems are operative:
- PRIM 3 or PRIM 1 controls the pitch trim alternatively. The PRIM in control is switched after each flight.

L1 If a PRIM or a electric motor fails, another flight control computer and electric motor will take over, to ensure maximum THS availability.

ROLL CONTROL

Ident.: DSC-27-10-10-00001997.0001001 / 28 APR 17
Applicable to: ALL

On each wing, the 2 ailerons and the spoilers 3 to 7 control the aircraft in roll.

Reconfiguration

L2 *Note:* *In the event of an all engine flameout, all EHAs/EBHAs are powered via the 230 V AC EMER 1 busbar.*

L1 AILERONS

L3 The maximum aileron deflection is 20 ° down and 30 ° up.

L1 The outer ailerons have two conventional actuators. Both actuators are active at the same time.
The outer ailerons are not deflected up or down above 250 kt.
The inner ailerons have one conventional actuator and one EHA.

In normal operation, for inner ailerons:
- The conventional actuators are active (they command the position of the surface)
- The EHAs are in damping mode (they follow the movement of the surface).

CONTROL

On inner ailerons, only one flight control computer is active. The others are in standby.
L2 When all systems are operative PRIM 2 controls the yellow actuator.
L1 On outer ailerons, two flight control computers, PRIM 2 and PRIM 3, are active at the same time.
L2 When all systems are operative, PRIM 2 controls the green actuator and PRIM 3 controls the yellow actuator.
L1 If a PRIM or a hydraulic system fails, another flight control computer and power source will take over, to ensure maximum aileron availability.
L2 For example: for the outer ailerons, if PRIM 2 or the green hydraulic system fails, PRIM 3 and the yellow hydraulic are still available. Only one actuator then controls the outer ailerons.
L1 The inner ailerons remain available in backup control (*Refer to DSC-27-10-40 Backup Control*).

SPOILERS

L3 The maximum spoiler deflection for roll control is 45 °.
L1 Each spoiler has one actuator (conventional or EBHA), and two flight control computers.
L2 If the yellow hydraulic system is available, the actuator of spoiler 5 operates as a conventional actuator. If the yellow hydraulic system fails, the actuator of spoiler 5 operates as an EHA, powered by the 230 V AC EMER 1 busbar.

When failed, a spoiler is commanded in the anti-extension mode. When the anti-extension mode is active, the affected spoiler:
- Remains retracted if it was retracted, or
- Remains in its position if it was extended below the balanced position, or
- Retracts to balanced position, if it was extended above its balanced position.

The balanced position is the position where the not commanded surface is free to float. This position will change during the flight depending on speed and aircraft attitude.
Depending on the root cause of the failure, the activation of the anti-extension mode may lead to an upward drift of the affected spoiler up to the balanced position.
As a consequence, the fuel consumption increase due to a failed spoiler may not be immediate but will occur only once the drift is established. Therefore, the fuel consumption increase due to a failed spoiled is indicated on the ECAM through a separate alert: F/CTL SPLRS PARTLY EXTENDED (*Refer to procedure*).

The procedure line related to the fuel consumption increase is indicated in the F/CTL PART(MOST) SPLRS FAULT alert only when the position of the affected spoiler(s) is lost (*Refer to procedure*).

YAW CONTROL

Applicable to: ALL

Ident.: DSC-27-10-10-20-00001998.0001001 / 17 NOV 17

RUDDER

One rudder controls the aircraft in yaw.

PRIM and SEC Flight Control Computers
Active Servocontrol / Flight Control Computer
Reconfiguration

L2 Note: *In the event of an all engine flameout, the EHA is powered via the 230 V AC EMER 2 busbar.*

L1 The rudder has two conventional actuators and one EHA:

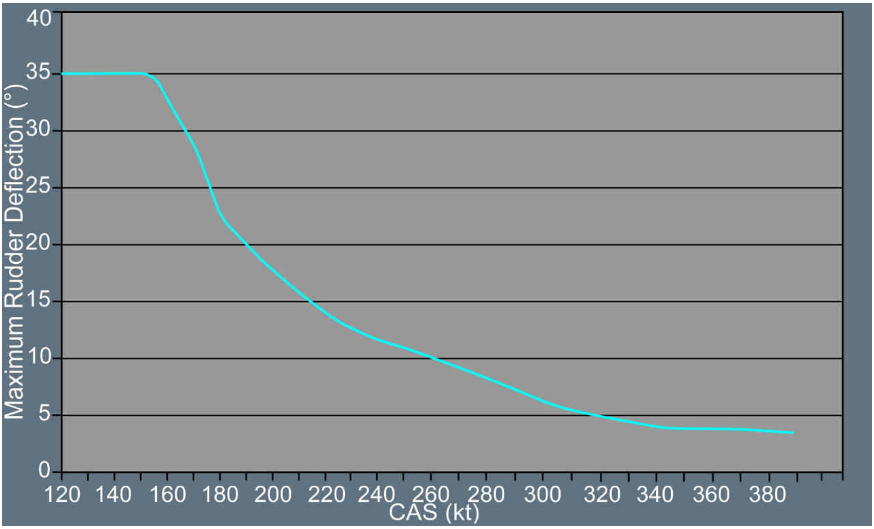
- Both conventional actuators are active at the same time (they command the position of the surface)
- The EHA is in damping mode (it follows the movement of the surface).

If a conventional actuator fails, the EHA is activated and the remaining conventional actuator is in damping mode. If a high rudder deflection rate is required, the remaining conventional actuator is activated in addition to the EHA.

RUDDER TRAVEL LIMITATION

Maximum rudder deflection is limited as a function of the aircraft speed.

Maximum Rudder Deflection



The maximum rudder deflection gradually reduce as the speed increases.
In all cases, the available rudder deflection provides sufficient yaw control within the entire flight envelope. This includes failure cases and maximum asymmetric thrust.

L3 In the case the three ADRs are failed, the maximum rudder deflection is a function of the slats/flaps position. Maximum rudder deflection is available when in CONF FULL.

L1 **RELATIONSHIP BETWEEN SIDESLIP/RUDDER DEFLECTION/RUDDER PEDAL TRAVEL**

Regardless of the aircraft speed, and therefore regardless of the maximum rudder deflection, full rudder pedal travel remains available.
However, above 150 kt, maximum rudder deflection may be achieved before maximum rudder pedal travel is reached.

CONTROL

Two flight control computers, PRIM 3 and PRIM 1 are active at the same time.
L2 When all systems are operative, PRIM 1 controls the green actuator and PRIM 3 controls the yellow actuator.

For example:
- If PRIM 1 fails, SEC 1 will takeover for the green actuator
- If the yellow hydraulic system fails, the EHA is activated, controlled by PRIM 2. The green hydraulic actuator activates in addition to the EHA if a high rudder deflection rate is required.

L1 The rudder remains available in backup control (*Refer to DSC-27-10-40 Backup Control*).

Ident.: DSC-27-10-10-20-00002006.0001001 / 06 MAY 15

RUDDER TRIM

Rudder trim is achieved via the Pedal Feel and Trim Unit (PFTU).

The PFTU has two electric motors (one controlled by SEC 2, the other controlled by SEC 3) to move the zero-force position of the rudder pedals in accordance with the position of the rudder surface:
- For rudder trim in manual flight
  Rudder trim is applied via the RUDDER TRIM selector on the pedestal.
- To reflect autopilot rudder trim orders, when the autopilot is engaged.
  L3 The autopilot orders are sent from the PRIMs, via the SECs.

L1 *Note:* *When the autopilot is engaged, the RUDDER TRIM selector is not active.*

L2 The authority of the rudder trim is 85% of the maximum rudder deflection.

L1 **AUTOMATIC RUDDER TRIM SETTING**

The rudder trim is automatically set at 0 ° for takeoff:
- When the first engine is started, or
- When the flight crew arms the ground spoilers.

SPEEDBRAKES, GROUND SPOILER AND ADHF CONTROL

Applicable to: ALL

Ident.: DSC-27-10-10-30-00001999.0002001 / 01 JUN 17

SPEED BRAKES CONTROL

All the spoilers can be used as speed brakes.
L2 When a speed brake fails on one side, the symmetric one on the other wing is inhibited.
Spoilers 3 to 7 are also used for roll control. The roll control function has priority over the speed brake function. When the sum of a roll order and a simultaneous speed brake order on one surface is above the maximum deflection available in flight, the symmetrical surface is retracted until the difference between the two surfaces is equal to the roll order.
L1 Each spoiler has one actuator (conventional or EBHA), and two flight control computers.
When all systems are operative the PRIMs control the spoilers. If a PRIM fails, a SEC will take over, to ensure maximum spoiler availability.

EXTENSION

The flight crew controls the speed brakes with the SPEED BRAKE lever.
L3 The maximum deflection for spoilers is:

Spoiler	Speed Brakes Maximum Deflection
1	15 °
2	12 °
3	20 °
4	40 °
5	40 °
6	40 °
7	30 °

L1 The speed brakes will automatically extend:

- In the case of VMO/MMO exceedance
  For more information, *Refer to DSC-22-27-20 High Speed Protection*.
- If EMER DES mode automatically engages
  For more information, *Refer to DSC-22-FG-70-60-40 Engagement Conditions*.

L2 The speed brake deflection is a function of

- The position of the SPEED BRAKE lever
  L3 When the SPEED BRAKE lever is at the 1/2 position, the speed brakes are 3/4 extended.
- L2 The configuration of the slats/flaps
  L3 Speed brake deflection is reduced in CONF 1+F, 2, 3, and FULL.
- L2 The load factor
  L3 Maximum deflection is reduced below 0.3 g, and above 1.7 g.

L1 **AUTOMATIC RETRACTION**

If extended, the speedbrakes automatically retract if:
- Alpha protection is activated, or
- A go-around is initiated.

Once retracted, the speedbrakes remain retracted, even if the conditions have disappeared. To extend the speed brakes again, the SPEED BRAKE lever must first be set to the retracted position for at least 5 s .

Ident.: DSC-27-10-10-30-00002007.0001001 / 24 APR 14

GROUND SPOILER CONTROL

All the spoilers and ailerons are also used as ground spoilers.

L2 When a spoiler fails on one side, the symmetric one on the other wing is inhibited.

L1 **ARMING**

The flight crew arms the ground spoilers by pulling the SPEED BRAKE lever into the armed position.

EXTENSION

Landing

If all thrust levers are at idle and the ground spoilers armed, when at least one landing gear is on ground, the ground spoilers partially extend. This partial extension, by decreasing the lift (lift dumping), will ease the touchdown of the aircraft, and will, consequently, lead to the full extension of the ground spoilers.

L3 During a partial extension:
- The deflection of spoilers 1 and 2 is 10 °
- The deflection of spoilers 3 to 7 is 15 °
- The ailerons are not deflected.

The extension rate is 5 °/s.

L1 The ground spoilers fully extend when two landing gears are on ground.

Note: *If the ground spoilers are not armed, they will automatically extend when the reversers are selected.*

L3 During a full extension:
- The deflection of spoilers 1 and 2 is 35 °
- The deflection of spoilers 3 to 7 is 50 °
- The deflection of the ailerons is 30 ° up.

The extension rate is 17 °/s.

L2 The roll function of the spoilers is inhibited below 110 kt, when the spoilers are used for the ground spoiler function. Roll control is available through ailerons.

FULL EXTENSION
(Braking)

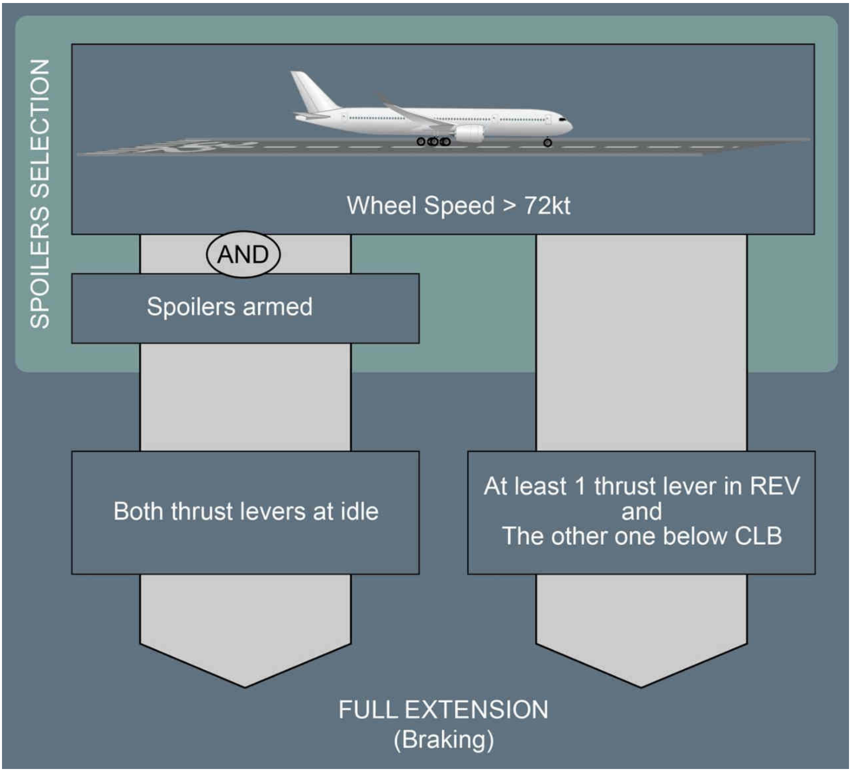
L1 Rejected Takeoff

The ground spoilers fully extend when the thrust levers are at idle and the speed is greater than 72 kt.

Note: *If the ground spoilers are not armed, they will automatically extend when the reversers are selected and the speed is greater than 72 kt.*

L3 During a full extension:
- The deflection of spoilers 1 and 2 is 35 °
- The deflection of spoilers 3 to 7 is 50 °
- The deflection of the ailerons is 30 °.

The extension rate is 17 °/s.



SPOILERS SELECTION
Wheel Speed > 72kt
AND
Spoilers armed
Both thrust levers at idle
At least 1 thrust lever in REV
and
The other one below CLB
FULL EXTENSION
(Braking)

L1

RETRACTION

The retraction occurs when one of the condition for ground spoilers selection is not valid anymore.
For example, the ground spoilers retract when the SPEED BRAKE lever is pushed down.

L3 The retraction rate is 17 °/s.

Ident.: DSC-27-10-10-30-00015908.0001001 / 30 APR 14

ADHF CONTROL

In configurations 1, 2, 3 and FULL, the Adaptive Droop Hinge Function (ADHF) improves the aerodynamic performance of the wing by controlling the gap between the spoilers' trailing edge and the flaps' leading edge.
The spoilers are deflected downward to control this gap.

L2 The SFCCs permanently send the position of the flaps to the PRIMs. Then, the PRIMs control the downward movement of the spoilers.

ADHF control

AILERON POSITION

L12

Indicates the position of the associated aileron.

The indication flashes and the F/CTL SD page is automatically displayed in the case of lateral imbalance when:
- The aircraft is in normal law, and
- The roll order commanded by the PRIM to compensate the imbalance is above 16 °, and
- The roll order commanded by the pilot through the sidestick is below 10 °.

On ground, the two green bars indicate the maximum deflection.
The maximum deflection indicators are used for the flight control check, to be sure that full surface deflection is available.

L12

The associated aileron is failed.
Associated with the following ECAM alert: F/CTL L(R) INR(OUTR) AILERON FAULT (*Refer to procedure*).

L12

The white round symbol indicates the neutral position (aileron droop).

The aileron droop occurs:
- When the flaps are extended for lift augmentation, or
- In cruise for performance optimization.

Ident.: DSC-27-10-20-272001-00002035.0001001 / 24 APR 14

SPOILER POSITION

On ground, the green bar indicates the maximum deflection.
The maximum deflection indicator is used for the flight control check, to be sure that full surface deflection is available.

- The flaps are extended
- The associated spoiler is deflected downward.

L12

- The flaps are extended
- The associated spoiler is extended.

The indication flashes and the F/CTL SD page is automatically displayed in the case of lateral imbalance when:
- The aircraft is in normal law, and
- The roll order commanded by the PRIM to compensate the imbalance is above 16 °, and
- The roll order commanded by the pilot through the sidestick is below 10 °.

- The flaps are retracted
- The associated spoiler is not extended.

L12

- The flaps are retracted
- The associated spoiler is extended.

The indication flashes and the F/CTL SD page is automatically displayed in the case of lateral imbalance when:
- The aircraft is in normal law, and
- The roll order commanded by the PRIM to compensate the imbalance is above 16 °, and
- The roll order commanded by the pilot through the sidestick is below 10 °.

L12

The associated spoiler is failed.
Associated with the following ECAM alert: F/CTL PART(MOST) SPLRS FAULT (*Refer to procedure*).
If the position of the associated spoiler leads to an impact on the fuel consumption, the following alert is displayed on the WD: F/CTL SPLRS PARTLY EXTENDED (*Refer to procedure*). Depending on the failure, this alert may appear immediately or later on during the flight .

The speed brakes position is displayed on the Slats/Flaps display (*Refer to DSC-27-10-20 Spoiler Indications on the Slats/Flaps Display*).

Ident.: DSC-27-10-20-272001-00002034.0001001 / 24 APR 14

SLATS/FLAPS MOTORS

The power supply of the associated slats(flaps) motor is available, and the motor operates normally.

L12

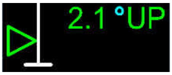
The power supply of the associated motor is failed.

Associated with one of the following ECAM alerts:
- HYD G(Y) SYS PRESS LO (*Refer to procedure*), or
- ELEC AC EMER 1 BUS 230 V + 115V FAULT (*Refer to procedure*), or
- ELEC AC EMER 2 BUS 230 V + 115V FAULT (*Refer to procedure*).

The associated motor is failed.

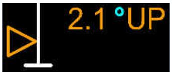
Ident.: DSC-27-10-20-272001-00002036.0001001 / 24 APR 14

PITCH TRIM POSITION



The pitch trim is set to 2.1 ° UP.
The pitch trim position ranges from 0.8 ° UP to 13.7 ° UP.

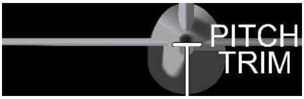
L12



The pitch trim is failed due to electrical power failure.
Associated with the following ECAM alert: F/CTL STABILIZER FAULT (*Refer to procedure*).

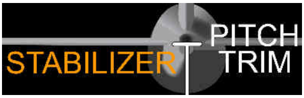
Ident.: DSC-27-10-20-272001-00017637.0001001 / 11 JUN 14

PITCH TRIM INDICATION



Normal operation.

L12



The pitch trim is jammed.
Associated with the following ECAM alert: F/CTL STABILIZER FAULT (*Refer to procedure*).

Ident.: DSC-27-10-20-272001-00017638.0001001 / 06 NOV 14

PITCH TRIM ACTUATORS

The power supply of the associated actuator is available, and the actuator operates normally.

L12

The power supply of the associated actuator is failed.

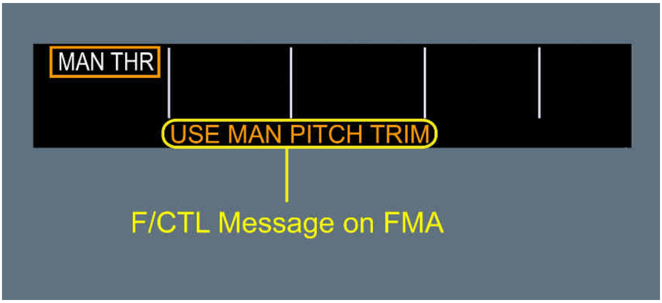
Associated with one of the following ECAM alerts:
- ELEC AC EMER 1 BUS 230V + 115V FAULT (*Refer to procedure*), or
- ELEC AC 1A BUS 230V FAULT (*Refer to procedure*).

The associated actuator is failed.

F/CTL MESSAGE ON FMA

Ident.: DSC-27-10-20-00019057.0001001 / 06 MAY 15
Applicable to: ALL

Message on FMA



L12

USE MAN PITCH TRIM

The flight controls are in direct law. The automatic pitch trim is lost.

Associated with the one of the following ECAM alert:
- F/CTL DIRECT LAW (PROT LOST) *Refer to procedure*, or
- NAV RA SYS A+B+C FAULT *Refer to procedure*.

For more information on the reconfiguration to direct law, *Refer to Direct Law*.
The message pulses for 9 s then remains steady.

PITCH TRIM DISPLAY

Ident.: DSC-27-10-20-00002017.0001001 / 18 JUN 15
Applicable to: ALL

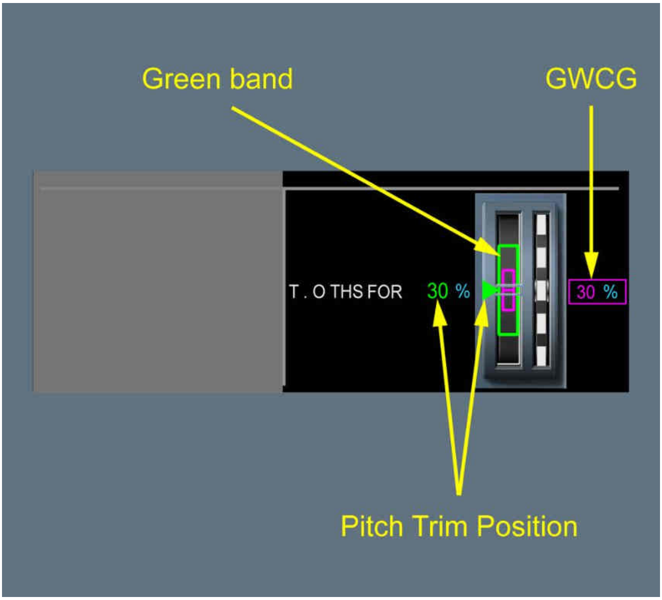
The pitch trim display is displayed on ground, before takeoff and after landing.

L3
- After takeoff, it disappears when the aircraft is 50 ft above the runway.
- After landing, it is displayed when the aircraft speed is below 30 kt

For touch and go, it will be displayed as soon as one of the following occurs:
- The engine levers are moved out of idle
- Spoilers are disarmed
- Flaps are retracted one step
- The flight crew presses the PITCH TRIM sw.

L1 *Note: The pitch trim position is also available on the F/CTL SD page.*

Pitch Trim Display



The following are displayed:

- The Green Band

  The green band is the range of pitch trim positions for which takeoff has been certified, whatever the aircraft's CG inside the takeoff envelope.

  The green band ranges from 20 % to 42.4 %

  L2 This corresponds to a pitch trim position from 1 ° to 9 ° Nose Up.

- L1 The aircraft GWCG

  L2 The GWCG is computed by the FQMS, based on the ZFW and ZFCG entered by the crew, and the FOB.

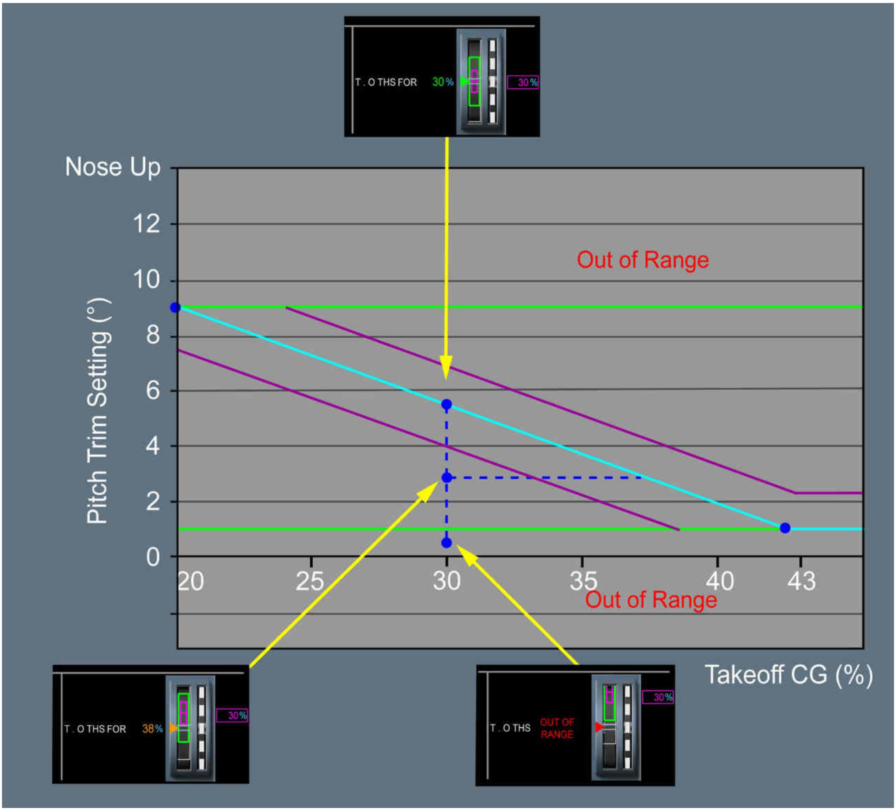
- L1 The position of the pitch trim, and the associated takeoff CG.

  L2 In order to always have the same aircraft behavior at rotation, there is an optimum pitch trim setting for each takeoff CG.

  This optimum pitch trim setting for takeoff is provided in the following graphic.

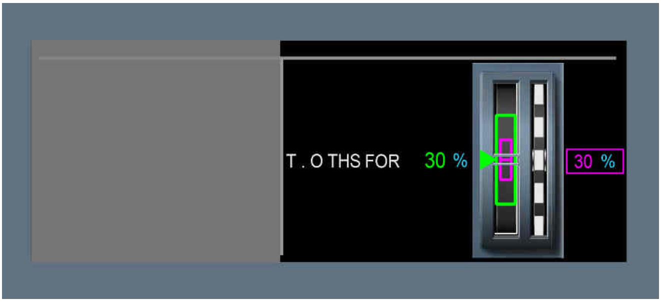
L1 PITCH TRIM SETTING FOR TAKEOFF

The pitch trim is automatically set for takeoff, based on the aircraft's CG (For more information: *Refer to DSC-27-10-10 Pitch control*). The pitch trim display enables to check the correct setting of the pitch trim, prior to takeoff.



PITCH TRIM SETTING AT TAKEOFF TARGET

Pitch Trim Position Indication

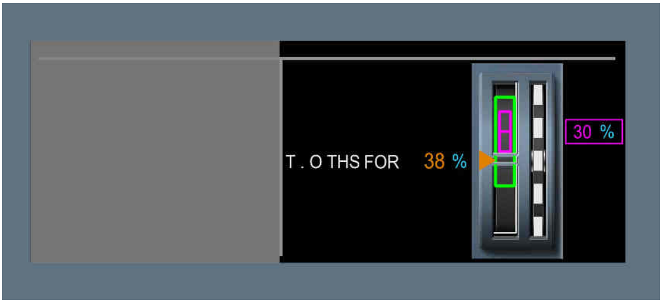


The pitch trim setting for takeoff is correct.

L2 The position of the pitch trim is within 1.5 ° of the optimum pitch trim position for takeoff for the current aircraft GWCG.

L1 PITCH TRIM NOT OPTIMUM

Pitch Trim Not at Target

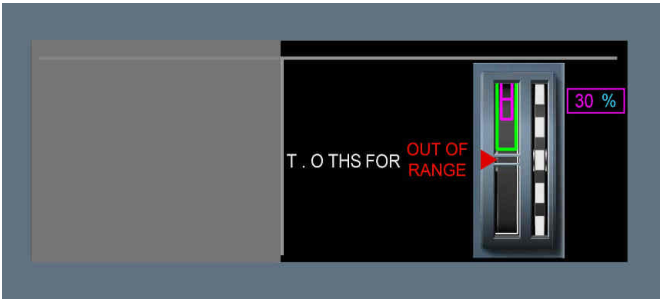


The position of the pitch trim is within the green band, but it is not optimum.

L2 The position of the pitch trim is more than 1.5 ° away from the optimum pitch trim position for takeoff for the current GWCG.
In this example, the target takeoff CG is 30 % and the associated optimum pitch trim setting is 5.5 ° nose up. But the pitch trim is set for a takeoff CG at 38 % i.e. 3 ° nose up, beyond the 1.5 ° margin around the optimum pitch trim setting.
Associated with the following ECAM alert: F/CTL PITCH TRIM/FMS/CG DISAGREE (*Refer to procedure*).

L1 PITCH TRIM OUT OF THE GREEN BAND

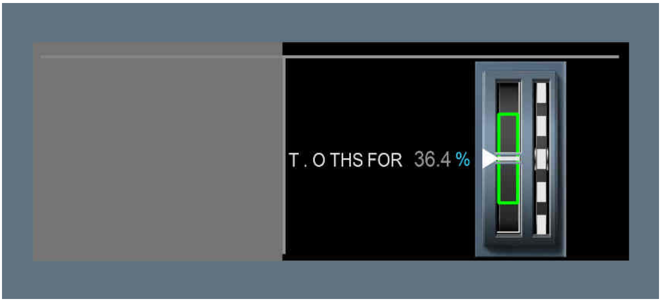
Pitch Trim Out of Green Band



The pitch trim is out of the green band.

L2 Associated with the following ECAM alert: CONFIG PITCH TRIM NOT IN T.O RANGE (*Refer to procedure*).

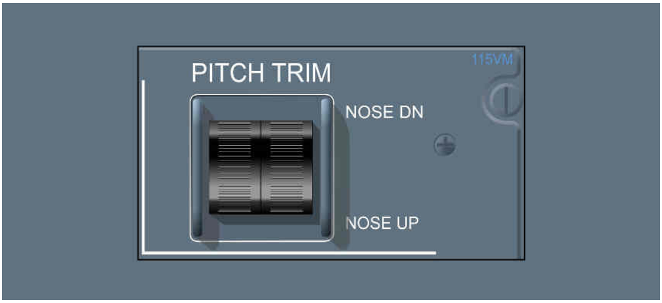
L1 PITCH TRIM AFTER LANDING



Pitch Trim after landing

PITCH TRIM SW

Ident.: DSC-27-10-20-00002010.0001001 / 06 MAY 15
Applicable to: ALL



PITCH TRIM sw

Controls the position of the Trimmable Horizontal Stabilizer (THS).

L3 It moves the THS at the following speed:

- In clean configuration : 0.3 °/s
- With slats/flaps extended : 0.8 °/s
- In the case of emergency electrical configuration : 0.1 °/s

L1 The PITCH TRIM sw is composed of two switches, which are spring loaded to neutral.

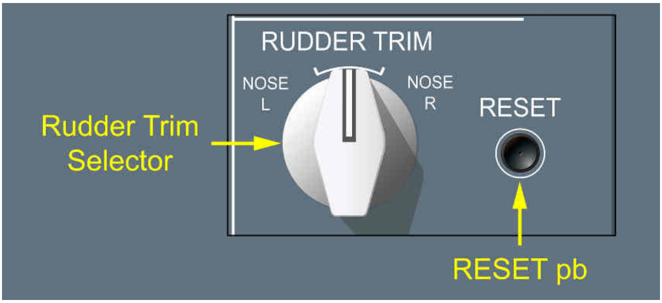
In order to move the pitch trim, both switches must be pressed simultaneously.
On ground, the PITCH TRIM sw has priority over the automatic takeoff trim setting.
The PITCH TRIM sw is inhibited in flight, except in direct law.
In direct law, the auto trim function is lost. The USE MAN PITCH TRIM message is displayed on the PFD.

RUDDER TRIM PANEL

Applicable to: ALL

Ident.: DSC-27-10-20-272003-00002011.0001001 / 30 APR 14

RUDDER TRIM Panel



Ident.: DSC-27-10-20-272003-00002020.0001001 / 24 APR 14

RUDDER TRIM SELECTOR

Controls the rudder trim position.

L3 It moves the neutral point of the artificial feel by an equivalent of:

- In clean configuration	:	0.5 °/s of rudder travel for quick inputs 1.5 °/s for inputs longer than 1.5 s
- With slats/flaps extended	:	1.5 °/s of rudder travel for quick inputs 3 °/s for inputs longer than 1.5 s

L1 *Note:* *The RUDDER TRIM selector is not active with the autopilot engaged.*

Ident.: DSC-27-10-20-272003-00002021.0001001 / 24 APR 14

RESET pb

Resets the rudder trim position.

L2 When pressed, the rudder trim position is ordered to zero at 3 °/s.

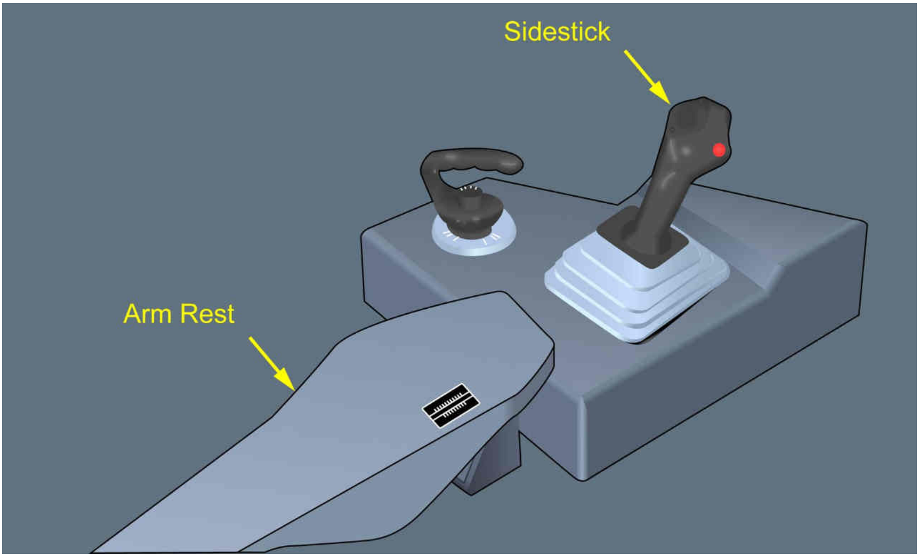
L1 *Note:* *The RESET pb is not active with the autopilot engaged.*

SIDESTICKS

Applicable to: ALL

Ident.: DSC-27-10-20-272002-00002012.0001001 / 24 APR 14

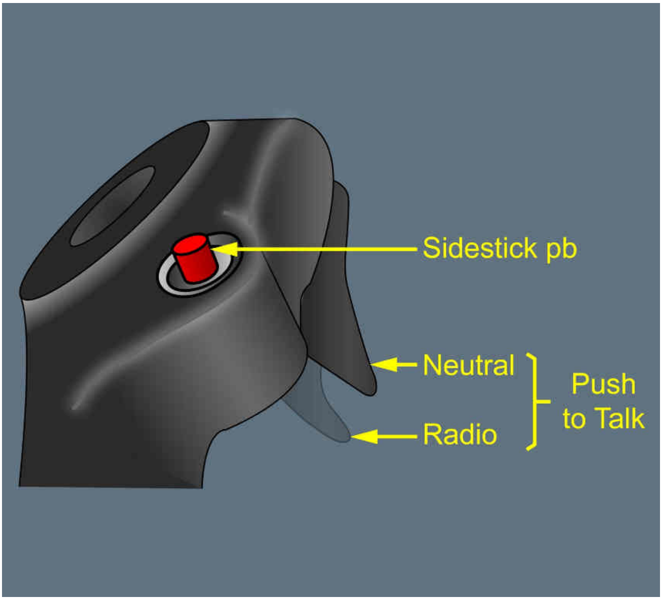
Lateral Console



Ident.: DSC-27-10-20-272002-00002023.0001001 / 07 MAY 18

SIDESTICKS

Sidestick



The sidesticks are springloaded to neutral. They are not mechanically linked, and do not receive feedback from the flight control surfaces.
When the autopilot is engaged, the sidesticks are locked in the neutral position.

If a flight crewmember applies a force above a given threshold:
- The sidesticks unlock
- The autopilot disengages
- The AUTO FLT AP OFF alert triggers.

L3 The autopilot disengages when a pilot applies a force of more than 5 daN in pitch, or 3.5 daN in roll.

L1 *Note:* *This is not the recommended method for autopilot disengagement. For more information, Refer to DSC-22-FG-40-30 Manual Disengagement.*

Each sidestick has two controls:
- The Radio Push To Talk switch
- The sidestick pb, for autopilot disengagement, or sidestick priority.

SIDESTICK PRIORITY LOGIC

At all times, only one flight crew member should fly the aircraft.
However, if both flight crew members use their sidesticks simultaneously, their orders are algebraically added.
L2 The flight control laws limit the combined order to the equivalent of the full deflection of one sidestick.
L1 In this case a DUAL INPUT callout is triggered.
A flight crew member can deactivate the other sidestick and take full control, by pressing and keeping pressed the sidestick pb.
To deactivate the other sidestick, the flight crewmember must press their sidestick pb for 40 s.
The other sidestick is permanently deactivated, until any flight crewmember presses their sidestick pb.
If both flight crew members press their sidestick pb, the last pilot to press gets the priority.
L2 If one sidestick was deactivated on ground, the CONFIG L(R) SIDESTICK FAULT (BY TAKE-OVER) alert is triggered at takeoff power application, or during the TO CONFIG test.
L1 For more information: *Refer to DSC-27-10-20 SIDESTICK PRIORITY light*

Ident.: DSC-27-10-20-272002-00002024.0001001 / 24 APR 14

ARM REST

The armrest on the sidestick side of the Captain and F/O seats are adjustable.
Correctly adjusting the seat eases the handling of the sidestick.
For information on how to adjust the armrest: *Refer to DSC-25-10 Flight Crew Seats*.

Pitch Law
Flight Law
Flare + Derotation Law
Rotation Law
Lateral Law
Flight Law
Ground Law

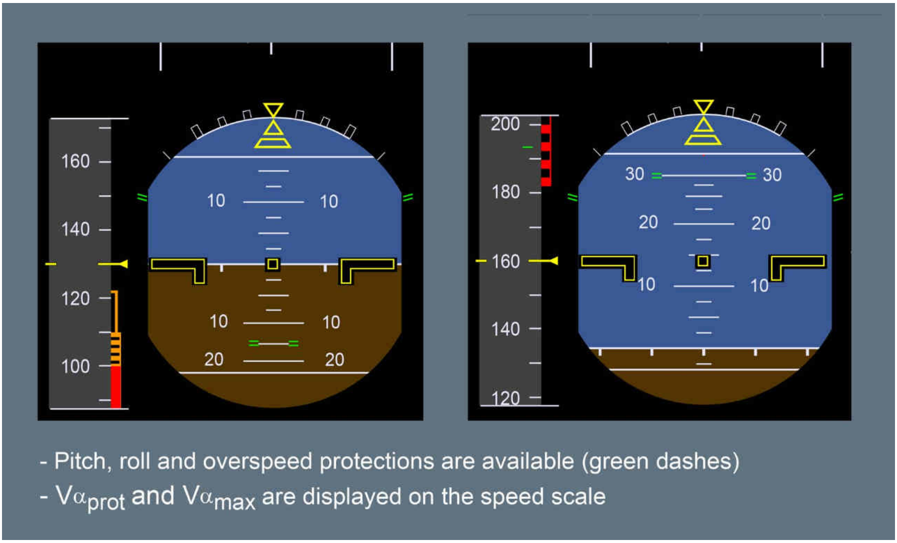
The normal law also provides the following flight envelope protections:

- Load factor protection (For more information: *Refer to DSC-22-27-20 Load Factor Protection*)
- Pitch attitude protection (For more information: *Refer to DSC-22-27-20 Pitch Attitude Protection*)
- Angle of attack protection (For more information: *Refer to DSC-22-27-20 High Angle of Attack Protection*)
- High speed protection (For more information: *Refer to DSC-22-27-20 High Speed Protection*)
- Bank angle protection (For more information: *Refer to DSC-22-27-20 Bank Angle Protection*).

The normal law also provides structural load alleviation, both in maneuver and in turbulence (*Refer to DSC-27-10-30 Load Alleviation Function*).

PFD DISPLAY

PFD Display in Normal Law



- Pitch, roll and overspeed protections are available (green dashes)
- $V\alpha_{prot}$ and $V\alpha_{max}$ are displayed on the speed scale

PITCH CONTROL

Applicable to: ALL

Ident.: DSC-27-10-30-271030A-00002038.0001001 / 08 JUL 19

ROTATION LAW

The objective of the rotation law is to provide an homogeneous rotation for all possible weight, CG and configurations, while minimizing the risk of a tail strike.
The rotation law is a pitch rate demand control law, providing tail strike protection.

L2 The flight crew can override the tail strike protection.

The rotation law depends on:
- The pitch rate
- The tail clearance
- The sidestick position.

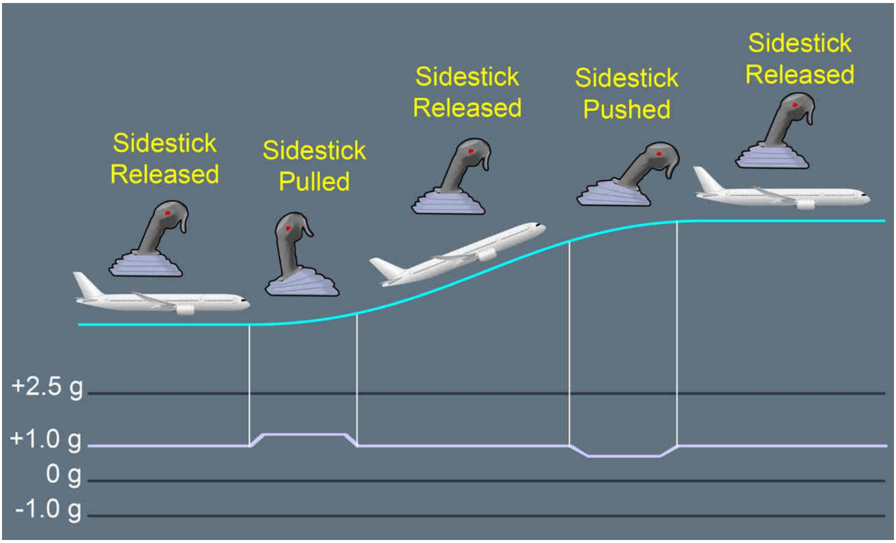
L1 *Note:* *A tail strike indication is also available on the PFD. Refer to DSC-31-CDS-40-20-30 Tail Strike Pitch Limit*

The rotation law is active on ground.

FLIGHT LAW

The normal law in flight is a load factor demand law with auto trim and full flight envelope protection.
In manual flight, the normal law provides elevator and pitch trim control from the sidesticks, to achieve a load factor which is a function of the sidestick deflection, independent of the aircraft speed.
With the sidestick at neutral and the wings level, the flight control system maintains 1g in pitch, corrected for pitch attitude. There is no need for the pilot to trim with speed and configuration changes.
In normal turns (up to 33° of bank), no pitch correction is required once the turn is established.

Pitch Normal Law



L3 The normal flight law is available in flight from 5 s after liftoff, to below 100 ft RA during the approach. (The normal flight law is gradually phased-in during 5 s, 5 s after liftoff).
The transition to the flight law is reduced to 1 s, if the angle of attack protection, or the pitch attitude protection is active.

Ident.: DSC-27-10-30-271030A-00002042.0001001 / 05 NOV 18

FLARE + DEROTATION LAW

The objective of the flare law is to:
- Provide a conventional aircraft behavior during the flare
- Enable a precise control of the vertical speed and touchdown point
- Provide a smooth derotation and avoid hard nose wheel touchdown.

The flare law is a direct law without autotrim, with some damping provided by a pitch rate feedback.
The flare law provides full elevator authority.
The flare law is active below 100 ft RA.

L3 *Note:* *If RA are detected lost, the flare law is active when the gear is down.*

LATERAL CONTROL

Applicable to: ALL

Ident.: DSC-27-10-30-271030B-00002039.0001001 / 02 OCT 14

GROUND LAW

The objective of the lateral ground law is to facilitate aircraft handling on ground.
The lateral ground law is a full authority control law in roll and yaw, with some yaw damping.
However, for small sidestick deflections, the lateral ground law helps the pilot to keep a small bank angle (less than 2 °), using only the ailerons. In particular, when the sidestick is at neutral, the law will aim to keep the wings level.
L2 When rudder pedal deflection is close to maximum, yaw damping is removed.
L1 The ground law is gradually phased in during 2 s after touchdown and phased out 2 s after lift off.

ENGINE FAILURE AT TAKEOFF

In the case of an engine failure during takeoff, the ailerons and spoiler 3 can be deflected on the wing opposite to the failed engine in order to increase yaw efficiency.

Note: *Increasing yaw efficiency in the case of an engine failure on ground, reduces the VMCG, and therefore improves the takeoff performance.*

The ailerons and spoiler deflection is proportional to the rudder input.

L2 The ailerons and spoiler will be deflected on the remaining engine side, when:
- The aircraft is on ground
- The speed is above 60 kt
- The rudder pedal deflection is more than 2/3 of the maximum rudder pedal deflection (23.1 °).

The outer aileron are deflected upwards.

When the rudder reaches its full deflection (35 °)
- The outer aileron reaches its full upwards deflection (20 °)
- The inner aileron reaches its full downwards deflection (20 °)
- Spoiler 3 reaches 40 ° upwards

L1 An automatic rudder input can also be transiently added to pilot input in order to minimize the effect of the engine failure.

L2 The automatic rudder input is available when:
- The speed is above 100 kt
- The aircraft lateral acceleration is above a defined threshold and is in the same direction as thrust asymmetry.

Note: *The automatic rudder input is proportional to the thrust asymmetry and is adapted to the actual situation. As an example, a large input will be applied for a light aircraft with high thrust close to VMCG. On the opposite, small or no automatic rudder input will be applied for a heavy aircraft with low thrust or at high speed, which ensures that the function will not hide the effect of the engine failure to the flight crew.*

RUDDER DEFLECTION WITH DIFFERENTIAL BRAKING

In order to have adequate directional control in the case of a rudder pedal fault or jammed rudder pedals, differential braking controls the rudder and nosewheel steering.

L3 Differential braking control of the rudder is available when:
- The aircraft is on ground
- The autopilot is not engaged
- The speed is above 50 kt.

L2 When the differential braking is more than 50%, the PRIMs order a rudder deflection, in addition to the brake pedals order.

L3 _Note:_ *The differential braking rudder deflection order is limited when the rudder pedals are not at 0 °.*

Ident.: DSC-27-10-30-271030B-00002043.0001001 / 08 JUL 19

FLIGHT LAW

The normal lateral law in flight:
- Is a roll rate demand law, by using the sidesticks
- Is a sideslip demand law, by using the rudder pedals.

The normal lateral law provides:
- Full flight envelope protection (maximum bank and sideslip angles)
- Turn coordination, and dutch roll damping.

The flight law is available in flight, gradually phased-in during 2 s after liftoff.

ROLL RATE DEMAND

In manual flight, the normal law provides aileron and spoiler control from the sidesticks, to achieve a roll rate which is proportional to the sidestick deflection, independent of the aircraft speed.

L3 With a full sidestick deflection, the maximum achievable roll rate is 15 °/s.

The maximum roll rate can be limited:
- To 7.5 °/s, if angle of attack protection is active
- Between 7.5 °/s and 15 °/s, in case of an engine failure, depending on the thrust asymmetry.

Bank Angle
Limit

L1 When the bank angle is less than 33 °, the normal law:
- Maintains a constant bank angle when the sidestick is at neutral (neutral spiral stability)
- Provides automatic pitch trim (turn compensation).

When the bank angle is above 33 °,
- The bank angle returns to 33 ° if the sidestick is at neutral (positive spiral stability is restored)
- Automatic pitch trim is not available (aft pressure on the sidestick is needed to maintain altitude).

The maximum achievable bank angle is:
- 67 ° in clean configuration
- 60 ° in high lift configurations
- 45 ° when the nose down pitch attitude protection is active

- 45 ° when the high speed protection is active (in this case, the bank angle returns to 0 when the sidestick is at neutral)
- Limited by the maximum achievable load factor, when angle of attack protection is active (the maximum achievable bank angle is above 45 °).

SIDESLIP DEMAND

In manual flight, the normal law provides rudder control from the rudder pedals, to achieve a sideslip which is proportional to the pedal deflection, independent of the aircraft speed.
For a given sideslip angle, the aircraft will stabilize at a given roll angle.

L2 Below 100 ft, the aircraft will try to maintain wings level, independently of sideslip demand. This is to assist pilot control in roll during the decrab phase in the case of crosswind conditions.

L1 The sideslip is limited by the flight control computers.

L2 The maximum sideslip is between:
- 2 ° at VMO
- 15 ° in CONF 3 and CONF FULL, at approach speed.

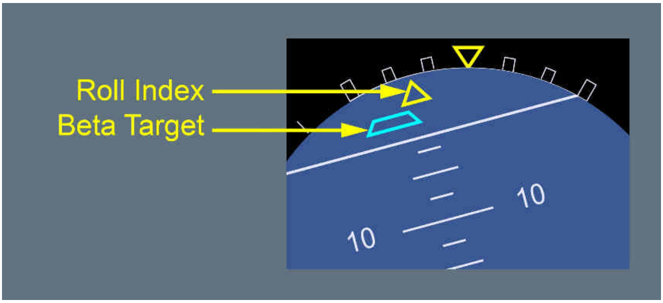
Note: *When maximum sideslip is reached, pushing any further on the rudder pedals will have no effect.*

L1 Engine Failure

In case of an engine failure, the lateral law provides sideslip and bank angle with a slowly diverging heading, as with a conventional aircraft.
During takeoff, the sideslip display is modified to ensure optimum takeoff performance. By centering the blue Beta target, the total aircraft drag is minimized. It results in a compromise between the drag produced by the flight control surfaces deflection and the drag produced by the sideslip of the airframe.

L2 Once the aircraft is in clean configuration with the autopilot engaged, the rudder pedals are automatically commanded to the neutral position.

Beta Target



LOAD ALLEVIATION FUNCTION

Ident.: DSC-27-10-30-00002040.0001001 / 03 DEC 15
Applicable to: ALL

The aim of the Load Alleviation Function (LAF) is to reduce the fatigue and static loads on the wing.
The LAF is part of the normal pitch law.
The LAF is available In normal law and can also be available in alternate law.

The LAF includes:
- The Maneuver Load Alleviation (MLA)
- The Gust Load Alleviation (GLA)
- The Differential Flaps Setting (DFS) for loads reductions purposes.

MANEUVER LOAD ALLEVIATION

The MLA reduces the loads during maneuvers. The MLA modifies the spanwise lift distribution which reduces the wing bending moment. This is done by symmetrically deflecting the ailerons and/or the spoilers.
The deflection of the ailerons and spoilers depends on the aircraft configuration, speed and the load factor.
Flight crew roll orders have priority on MLA.

L3 In clean configuration, the MLA is active above 200 kt:
- For a positive load factor above 1.7 g: only the ailerons are deflected upwards to a maximum of 20 °
- For a negative load factor below -0.5 g: ailerons are deflected downwards and spoilers upwards. The spoilers and outboard ailerons can be deflected to a maximum of 20 ° and the inboard ailerons to a maximum of 10 °.

L1 The MLA is inhibited in configuration FULL.
L2 In configurations 1, 2, 3 only the ailerons are deflected upwards to a maximum of 15 ° for a positive load factor above 1.7 g.

L1 GUST LOAD ALLEVIATION

The GLA reduces the loads in the case of turbulence. The GLA reduces the lift of the outer wing. This is done by symmetrically deflecting the ailerons upwards. The induced pitch effect is compensated with the elevators.
L2 The GLA is active above 200 kt. The deflection of the ailerons depends on the variation of the angle of attack during the last 5 s.
The ailerons can be deflected up to a maximum of 12 ° upwards.
L1 Flight crew roll orders have priority on GLA.

DIFFERENTIAL FLAPS SETTINGS FOR LOAD ALLEVIATION

The DFS modifies the spanwise lift distribution which reduces the wing bending moment for high GW. This is done by deflecting inner flaps down to a maximum of 2 °.

L2 The DFS for load alleviation is available:
- For GW above MTOW - 30 t (66 klb)
- In clean configuration
- In normal law

Intentionally left blank

RECONFIGURATION CONTROL LAWS

Ident.: DSC-27-10-40-00002044.0003001 / 03 JAN 20
Applicable to: ALL

A single failure cannot lead to the loss of the normal flight control law.
However, a combination of failures may result in a degradation of the flight control laws. The level of degradation will depend on the severity of the failures.
This degradation of the flight control laws is referred to as reconfiguration.

There are two reconfiguration levels:
- Alternate law (*Refer to DSC-27-10-40 Alternate Law*)
- Direct law (*Refer to DSC-27-10-40 Direct Law*).

F/CTL Law	**Ops impact**	**Failure Leading to Reconfiguration**
ALTERNATE LAW	Max Speed: Depending on the position of flaps/slats	F/CTL SLAT SYS 1+2 FAULT
		F/CTL FLAP SYS 1+2 FAULT
		F/CTL INR FLAPS FAULT
		F/CTL SLATS LOCKED
		F/CTL FLAPS LOCKED
	Max Speed: 310 kt	F/CTL L(R) INR(OUTR) AILERON FAULT (if two ailerons are failed)
		NAV RA SYS A+B+C FAULT (During the approach phase)
		F/CTL RUDDER FAULT
		F/CTL L(R) ELEVATOR FAULT
		F/CTL PART SPLRS FAULT (if more than 3 pairs of roll spoilers are failed)
		F/CTL MOST SPLRS FAULT
		F/CTL STABILIZER FAULT
		NAV ADR 1+2+3 FAULT
		HYD G+Y SYS PRESS LO
		ENG ALL ENGINES FAILURE
		ELEC EMER CONFIG

Continued on the following page

Continued from the previous page

F/CTL Law	Ops impact	Failure Leading to Reconfiguration
DIRECT LAW	Max Speed: 310 kt/M .86 APs and FDs not available	F/CTL PRIM 1 FAULT and F/CTL PRIM 2 FAULT and F/CTL PRIM 3 FAULT
		F/CTL SLAT SYS 1+2 FAULT and F/CTL FLAP SYS 1+2 FAULT and The slats and flaps are indicated amber XX on the slats/flaps display and The aircraft is below 22 000 ft
		F/CTL L ELEVATOR FAULT and F/CTL R ELEVATOR FAULT
		Loss of F/CTL Redundancy. (For example when it remains less than 1 inner(outer) aileron and 2 roll spoilers available on each wing.)
		Loss of ground detection information.
		NAV AOA DISAGREE
		Loss of the 3 IRs.
		ZFW/ZFWCG not inserted in FMS before engine start, or inserted less than 10 min after the first engine shutdown.
		Accuracy of GW and CG degraded (above 4 %) on ground.

In addition, the following enable aircraft control, in exceptional conditions:

- Abnormal attitude law, when the aircraft is far outside of the protected envelope (*Refer to DSC-27-10-40 Abnormal Attitude Law*)
- Electrical Backup mode, when all flight control computers are lost (*Refer to DSC-27-10-40 Backup Control*).

ALTERNATE LAW

Ident.: DSC-27-10-40-00002045.0001001 / 28 APR 17
Applicable to: ALL

In alternate law the pitch, roll and yaw controls are similar to controls in normal law.
All protections are indicated as lost. However, protections are still available but, depending on the failure, may not be as efficient as in normal laws.
The flight crew should get prepared to experience an aircraft response similar to normal law when approaching flight envelope limits.
As protections may not be as efficient as in normal laws, the flight crew must fly the aircraft more attentively to avoid any inadvertent limit exceedance.
The OVERSPEED and STALL warnings remain available.

The speed is limited to 310 kt to maintain an adequate overspeed margin.

- Pitch, roll and overspeed protections are lost (amber crosses)
- $V\alpha_{prot}$ and $V\alpha_{max}$ are replaced $V\alpha_{sw}$
- Auto Trim is lost (USE MAN PITCH TRIM)

PITCH CONTROL

In direct law, there is a direct relationship between the sidestick position and the elevator position.
There is no autotrim. Pitch trim is adjusted via the PITCH TRIM sw.

The speed is limited to:

- 310 kt, to maintain an adequate overspeed margin
- M .86, to maintain an adequate pitch stability.

LATERAL CONTROL

The lateral control is in direct law:

- Roll direct law.
  L2 There is a direct relationship between the sidestick position and the aileron and spoiler position. If all the roll surfaces are available (i.e. no hydraulic failure), the maximum achievable roll rate is higher than in normal law.
- L1 Yaw direct law
  L2 There is a direct relationship between the rudder pedal position and the rudder position. The yaw direct law provides limited dutch roll damping and turn coordination.

L1 PROTECTIONS

All protections are lost.
The OVERSPEED and STALL warnings remain available.

ABNORMAL ATTITUDE LAW

Ident.: DSC-27-10-40-00002047.0001001 / 09 MAR 16
Applicable to: ALL

If for any reason the aircraft goes far outside the normal flight envelope and reaches an extreme attitude, the flight control law will be modified.
The abnormal attitude law will engage and will provide the PF with maximum efficiency to recover normal attitude.

L2 The abnormal attitude law engages when one of the following values is reached:

- Pitch attitude above 50 ° nose up or 30 ° nose down
- Bank angle above 120 °
- Angle-of-attack above 37.5 °
- Speed above 420 kt or below 70 kt
- Mach above M 0.98 or below M 0.11.

L1 When abnormal attitude law engages:

- The pitch direct law is active with increased authority
- The roll direct law is active
- The yaw direct law is active.

When the aircraft attitude returns within the normal flight envelope, the abnormal attitude law disengages and the alternate law engages with pitch normal law, roll normal law, and yaw normal law for the remainder of the flight.

BACKUP CONTROL

Ident.: DSC-27-10-40-00002048.0001001 / 06 MAY 15
Applicable to: ALL

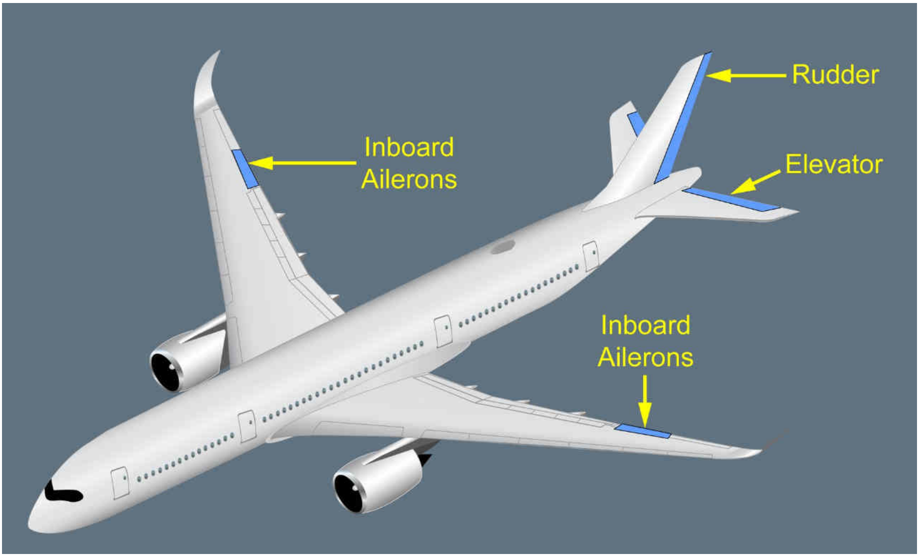
In the unlikely event of the loss of all flight control computers (PRIMs and SECs), the backup control provides control and stability of the aircraft.

The backup control controls the following surfaces:
- Inner ailerons
- Rudder
- Elevators.

When the backup control is active, the flight crew controls the aircraft via:
- The sidesticks
- The rudder pedals
- The pitch trim switch.

L2 When the backup control is active, the control of the stabilizer is lost. The pitch trim switch remains available and controls the elevators.

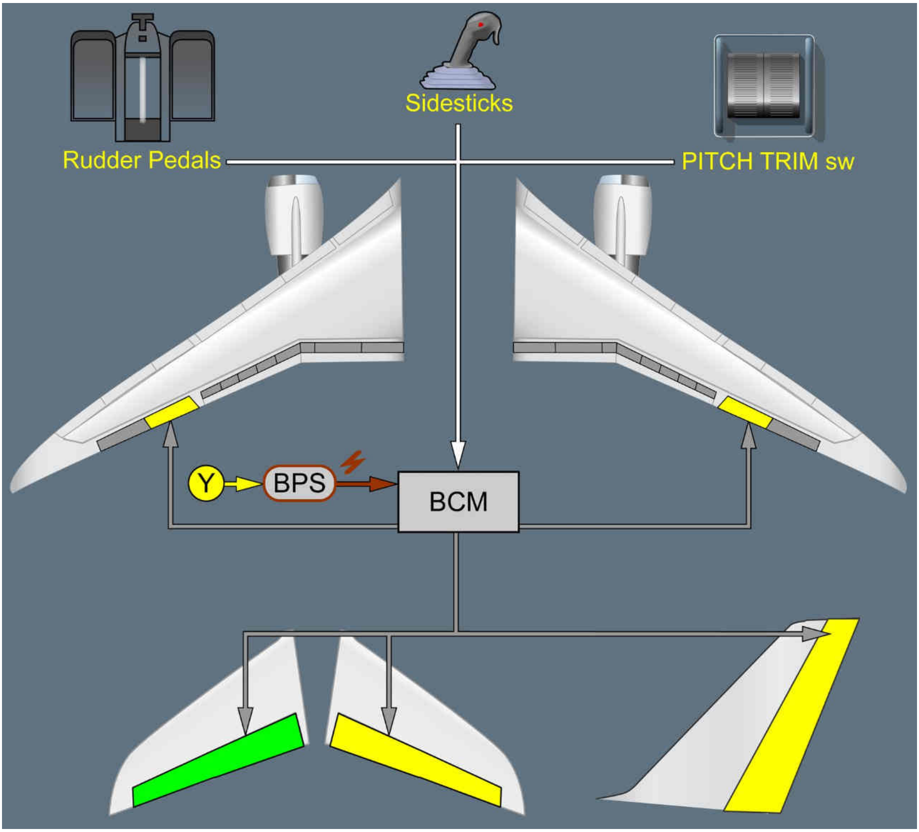
Backup Control Surfaces



The backup control has:

- One backup Power Supply (BPS)
  The BPS is electrical generator, supplied by the yellow hydraulic system. The BPS starts to operate when PRIM 2 and SEC 2 are failed or no longer supplied.
- One Backup Control Module (BCM).
  The BCM is powered by the BPS. It starts to operate when all flight control computers are lost.

Backup Control



Intentionally left blank

OVERVIEW

Ident.: DSC-27-20-10-00013626.0001001 / 24 APR 14
Applicable to: ALL

The following surfaces are located on each wing, and provide lift augmentation:

- 7 slats surfaces
  L2 1 of these surfaces is droop nose.
- L1 2 flaps surfaces
- 2 ailerons, via the aileron droop function.

Slats are electrically and hydraulically-actuated.
Flaps are hydraulically-actuated. Outer flaps are also electrically actuated.
The FLAPS lever is used to select the position of the slats and flaps. This lever is located on the center pedestal.

SLAT (FLAP) SYSTEMS

The slats and flaps are monitored and controlled as follows:
- SLAT SYS 1 and SLAT SYS 2 monitor and control the slats
- FLAP SYS 1 and FLAP SYS 2 monitor and control the flaps.

All four systems each have:
- 1 Slats(Flaps) Control Unit: SLAT(FLAP) CTL 1(2)
- 1 Motor
- 1 Power-Off Brake (POB).

SLAT (FLAP) Ctl

Each SLAT CTL:
- Monitors the slats
  For monitoring purpose, the slats systems are fitted with a set of position sensors used to monitor any malfunction in the slats system. All the sensors are connected to both slats control units.
- Controls the motor of its associated slats system.

Each FLAP CTL:
- Monitors the flaps
  For monitoring purpose, the flaps systems are fitted with a set of position and load sensors used to monitor any malfunction in the flaps system. All the sensors are connected to both flaps control units.
- Controls the motor of its associated flaps system
- Controls the Active Differential GearBox (ADGBs).

SLAT CTL 1(2) and FLAP CTL 1(2) are part of Slat Flap Control Computer (SFCC) 1(2).

MOTOR

Slats are actuated by:
- One electrical motor that SLAT CTL 1 controls
  The AC EMER 1 -230 V busbar supplies the electrical motor part of SLAT SYS 1.

  Note: *On ground, the electrical motor is operative, only when the hydraulic systems are pressurized. This prevents inadvertent slats movement with ground personnel around the aircraft.*
- One hydraulic motor that SLAT CTL 2 controls
  The YELLOW hydraulic system supplies the hydraulic motor part of SLAT SYS 2.

Inner flaps and outer flaps are actuated by:
- One hydraulic motor that FLAP CTL 1 controls
  The YELLOW hydraulic system supplies the hydraulic motor part of FLAP SYS 1.
- One hydraulic motor that FLAP CTL 2 controls
  The GREEN hydraulic system supplies the hydraulic motor part of FLAP SYS 2.

In addition, outer flaps can be actuated by the ADGBs electrical motors. For more information on the ADGB, *Refer to Active Differential Gearbox (ADGB)*.

Ident.: DSC-27-20-10-01-00013633.0001001 / 24 APR 14

L2 GEARBOX

Gearboxes are used to connect the slats(flaps) motors to the transmission shaft.
A gearbox transfers power to the surfaces, using torque-shaft transmission.
The SLAT(FLAP) SYS gearbox adds the speed of the motors of both slats(flaps) systems (speed-summing system). Therefore, the slats(flaps) will operate at half speed, if one motor is lost.
The ADGB gearbox adds the speed of the electrical motor to the transmission shaft to introduce an additional power source for outer flap movement. Therefore, the capability to move only the outer flap is lost when the ADGB electric motor is lost.

Ident.: DSC-27-20-10-01-00013634.0001001 / 24 APR 14

L2 WING TIP BRAKES (WTB)

The WTBs mechanically lock the slats(flaps) transmission shaft, when both SLAT(FLAP) CTL detect:
- A runaway, or asymmetry
- An overspeed.

The WTBs also mechanically lock the flaps transmission shaft when both FLAP CTL detect a flap disconnection.
In all the above cases, when a WTB is set, it cannot be unlocked in flight. Maintenance action is required.
For more information on the associated ECAM procedure: *Refer to PRO-ABN-F_CTL F/CTL FLAPS LOCKED*, or *Refer to PRO-ABN-F_CTL F/CTL SLATS LOCKED*.
When a Differential Flap Setting (DFS) is needed with inner flap movement only, the flaps WTBs are set to block the outer flap movement. In this case, the flaps WTBs can be unlocked when needed.

L3 DC EMER 1 and DC 2 keep the WTBs of the slats unlocked. In case both these busbars fail, the WTBs of the slats will mechanically lock the slats.
DC EMER 2 and DC 1 keep the WTBs of the flaps unlocked. In case both these busbars fail, the WTBs of the flaps will mechanically lock the flaps.

Ident.: DSC-27-20-10-01-00014921.0001001 / 24 APR 14

L2 POWER-OFF BRAKES (POB)

Each motor of the slats (flaps) systems and each ADGB is fitted with a Power-Off Brake (POB).

The POB, when set, mechanically locks the transmission shaft from its associated motor to the gearbox:
- When the slats (flaps) have reached the selected position
- In the case of runaway or asymmetry
- In the case of a power supply failure of a motor.

The SLAT(FLAP) CTL electrically control the POBs.
- Each SLAT(FLAP) CTL controls the POB of its dedicated motor.
- Both FLAP CTL 1 and FLAP CTL 2 control the POB of the ADGBs.

Ident.: DSC-27-20-10-01-00013647.0001001 / 24 APR 14

ACTIVE DIFFERENTIAL GEARBOX (ADGB)

The flaps systems can control the inner and outer flaps independently to enable a Differential Flap Setting (DFS).

L2 For more information on the DFS, *Refer to Differential Flap Setting*.

L1 This is achieved through the installation of two Active Differential Gearboxes (ADGBs).
There is one ADGB per wing, connected to the transmission shaft between the inner flap and the outer flap.

Each ADGB is composed of:
- One electrical motor
  L3 The AC EMER 2 - 230 V busbar supply both electrical motors.
- L2 One POB
  L3 The AC 1A - 230 V busbar and the AC EMER 2 - 230 V busbar supply both POBs.
- L1 One speed summing differential gearbox for the connection to the transmission shaft.

L2 In the case of loss of both hydraulic systems, the capability to move the outer flaps remains available through the ADGBs electric motors.

L1 Both FLAP CTL command the ADGBs:
- The FLAP CTL 2 commands the ADGBs electric motors and POBs
- The FLAP CTL 1 commands the ADGBs POB only.

L2 In the case of failure of the FLAP CTL 2, the capability to move the outer flap only is lost.
Nevertheless, the capability of inner flap movement or uniform inner and outer flaps movement is possible from FLAP CTL 1 through the control of the POBs.

CONFIGURATIONS

Ident.: DSC-27-20-20-00013651.0001001 / 14 NOV 17
Applicable to: ALL

The following table provides the configurations and associated surface positions (degrees), for each FLAPS lever position.

Slats/Flaps Configurations

FLAPS Lever Position	SLATS	INNER FLAP	OUTER FLAP	Aileron Droop	Configuration on Slats/Flaps Display	Maximum Speed	Flight Phase
0	0°	0°	0°	0°		VMO/ MMO	Cruise
1	18°	0°	0°	0°		255 kt	Holding/ Approach
	18°	16°	16°	10°		220 kt	Takeoff/ Approach
2	18°	20°	20°	10°		212 kt	Takeoff/ Approach
3	18°	26°	26°	10°		195 kt	Takeoff
	24°	26°	26°	0°		195 kt	Approach/ Landing
FULL	24°	37.5°	37.5°	0°		186 kt	Landing

L3 In order to improve the aerodynamic efficiency in flaps extended configurations, the spoilers are deflected downward to control the gap between the spoilers' trailing edge and the flaps.
The PRIMs and SECs command the spoilers deflection based on the flaps' positions.

Slats/Flaps Configuration	Spoilers 1-4	Spoilers 5-6	Spoiler 7
0	0 °	0 °	0 °
1	0 °	0 °	0 °
1+F	4 °	3 °	3 °
2	5 °	4 °	3.5 °
3	6.5 °	5 °	5 °
FULL	7.5 °	7 °	0 °

The spoilers downward deflection is visible on the F/CTL SD page.
For more information on spoiler position indication on the F/CTL SD page, *Refer to DSC-27-10-20 Spoiler Position*.

L2 If the slats or flaps are jammed, the following table gives the maximum speed (VFE) that is associated with the current abnormal configuration:

VFE ABN CONF (kt)			
	S = 0	0 < S ≤ 1	S > 1
F = 0	255	255	215
0 < F ≤ 1	230	220	215
1 < F ≤ 2	220	212	200
2 < F ≤ 3	215	200	200
F > 3	200	200	200

L3 If the slats or flaps are jammed, the VFEs displayed on the PFD and on the ECAM are increased vs. the placard speeds. This is operationally necessary to get a minimum margin between VLS and VFE NEXT, when the slats/flaps are jammed in an intermediate position.
Example: When the slats are jammed at 0 °(S=0) and flap lever is in position 1, the VFE NEXT displayed on the PFD is 230 kt instead of 220 kt.

Auto Retraction/Extension System (ARS/AES)

Ident.: DSC-27-20-20-27-20-20-00013660.0001001 / 24 APR 14

AUTOMATIC RETRACTION SYSTEM (ARS)

In CONF 1+F, the Automatic Retraction System (ARS) automatically retracts the flaps, when needed. The resulting configuration is CONF 1.

L2 The ARS activates when the aircraft reaches a speed of 210 kt, and if still in CONF 1+F.
In the case of high-weight takeoff, the S speed will be above 210 kt. The ARS will activate, as the aircraft accelerates toward S speed. This prevents excessive loads on the flaps, and improve climb performance.

Note: *S can also be above the VFE of CONF 1+F.*

Ident.: DSC-27-20-20-27-20-20-00013661.0001001 / 04 MAY 16

AUTOMATIC EXTENSION SYSTEM (AES)

In CONF 1, the Automatic Extension System (AES) automatically extends the flaps, when needed. The resulting configuration is CONF 1+F.

L2 The AES activates, when the aircraft speed goes below 203 kt, and if still in CONF 1.
In approach, except for high/overweight landing, the S speed will be less than 203 kt. The AES will activate as the aircraft decelerates towards S speed. This improves the deceleration performance during approach.

Ident.: DSC-27-20-20-27-20-20-00013662.0001001 / 24 APR 14

FLAP LOAD RELIEF SYSTEM (FLRS)

The Flap Load Relief System (FLRS) limits the loads on the flaps, in the case of a VFE exceedance. The FLRS is only available in CONF 2, 3, or FULL.

L2 The FLRS automatically retracts the flaps at VFE + 2.5 kt (i.e. before the overspeed warning triggers at VFE + 4 kt).

L1 When the FLRS is active:
- The FLRS retracts the flaps to the next retracted flap position
- A pulsing F RELIEF message appears in the Slat/Flap display of the PFD
- The PFD still indicates the VFE that corresponds to the selected lever position

L2
- The FWS triggers an overspeed warning, if the speed exceeds the VFE of the actual slats/flaps configuration + 4 kt (i.e. the overspeed warning does not consider the selected lever position).

L1 When the VFE is no longer exceeded, the flaps automatically return to their normal (selected) position.

L2 The FLRS automatically extend the flaps at VFE – 2.5 kt.

SLAT ALPHA/SPEED LOCK FUNCTION

Ident.: DSC-27-20-20-00013687.0001001 / 24 APR 14
Applicable to: ALL

The slat alpha/speed lock function inhibits slats retraction to zero at a high Angle-Of-Attack (AOA), and/or at a very low speed.

L2 The slat alpha/speed lock function prevents the aircraft from losing altitude, when the slats are retracted to zero.

L3 The slats and flaps control units use the AOA, or the airspeed, to inhibit slats retraction. The ADIRUs provide this information to the slats and flaps control units.

L2 When the FLAPS lever is set to 0, the slats alpha/speed lock function activates and inhibits slats' retraction, if:

- AOA is above 10.6 °, or
- The speed is less than 140 kt.

Note: *If the FLAPS lever is already set to 0, when either of the above conditions occurs, then the function will not activate.*

L1 If the slat alpha/speed lock function is active:

- A pulsing A. LOCK message appears in the Flap/Slat display of the PFD
- The PFD indicates the VLS that corresponds to the actual slats/flaps position.

L2 Once the slats alpha/speed lock function is active, the slats retract to 0 when:

- AOA is less than 10.3 °, or
- The speed is above 146 kt.

SLATS/FLAPS CRUISE BAULK FUNCTION

Ident.: DSC-27-20-20-00013688.0001001 / 24 APR 14
Applicable to: ALL

If the FLAPS lever is inadvertently moved from 0 to 1 during cruise, the slats/flaps cruise baulk function will maintain the slats and flaps in their fully retracted position. In addition, the ECAM will trigger the F/CTL FLAP LVR NOT ZERO warning.

L2 The slats/flaps cruise baulk function activates, when the indicated airspeed is above 265 kt, or the aircraft is at or above 22 000 ft.

The slats/flaps cruise baulk function is valid only for FLAPS lever position 1. Any other FLAPS lever (2, 3, or FULL) will override the cruise baulk function, and enable slats and flaps extension.

DIFFERENTIAL FLAP SETTING

Applicable to: ALL

Ident.: DSC-27-20-20-27-20-30-00014918.0001001 / 24 APR 14

The Differential Flap Setting (DFS) is made possible through the installation of the 2 ADGBs. The purpose of the DFS is to operate the outer flap independently from the inner flap.

The DFS is used in cruise through the flap cruise deployment function.

L2 In the case of impossibility to perform the DFS in cruise, the FLAP CTL performs a recovery procedure. The purpose of the recovery procedure is to set back the inner and the outer flaps to 0 °.

If the recovery procedure is not successful, the F/CTL DIFF FLAP SETTING FAULT alert is displayed on the WD (*Refer to procedure*).

Ident.: DSC-27-20-20-27-20-30-00013706.0001001 / 03 JUL 20

1 FLAP CRUISE DEPLOYMENT FUNCTION

The flap cruise deployment function performs symmetrical small deflection of the flaps and ailerons (aileron droop) during cruise.

The flap cruise deployment function permits to manage the center of lift of the wing and to adjust the camber of the wing in order to:

- Reduce the drag and therefore slightly improve the aircraft performance

  L2 The flap cruise deployment function for performance is only available with the autopilot engaged and all engines operative.

- L1 Reduce the loads (inner flaps movement only).

L2 The PRIMs command the flap cruise deployment based on aircraft data (e.g. altitude, Mach, FOB, etc.)

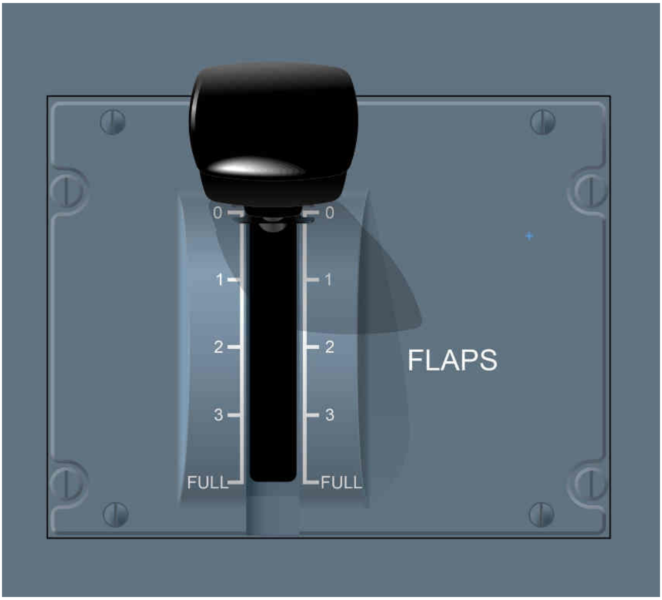
FLAPS LEVER

Ident.: DSC-27-20-30-00014148.0001001 / 24 APR 14
Applicable to: ALL

FLAPS lever



The FLAPS lever controls both the slats and the flaps at the same time.
There are five FLAPS lever positions to select the desired configuration.
For more information, *Refer to DSC-27-20-20 Configurations*.

Note: The FLAPS lever must be pulled out of detent, before it can be set to any position.

L2 The FLAPS lever has a mechanical stop at positions 1 and 3. This prevents inadvertent excessive slats/flaps extension or retraction.
The FLAPS lever cannot be set to an intermediate lever position.

L1 OVERRIDE MECHANISM

The FLAPS lever includes an override mechanism that is used if the FLAPS lever is jammed. The override mechanism allows to extend the slats/flaps by one step (e.g. from 0 to 1, from 3 to FULL). To use the override mechanism, the flight crew moves the lever by one step with a strong force, without pulling the lever out of detent.

The override mechanism is reversible.

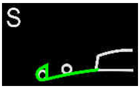
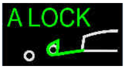
SLATS— POSITIONS AND MESSAGES

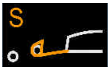


Position of the slats.



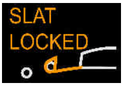
The alpha/speed lock function is active.
Both the green A LOCK message and the green slat index pulse.

L12



The slats are failed.
Associated with the following ECAM alert: F/CTL SLAT SYS 1+2 FAULT (*Refer to procedure*).
May also result from a failure of both the AC EMER 1 - 230 V and YELLOW hydraulic.

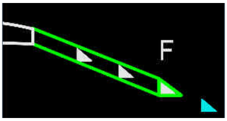
L12



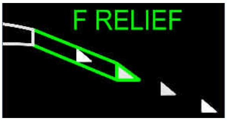
Wing-tip brakes are applied to the slats.
Associated with the following ECAM alert: F/CTL SLATS LOCKED (*Refer to procedure*).

Ident.: DSC-27-20-30-273001-00002118.0001001 / 03 JUL 20

1 FLAPS— POSITIONS AND MESSAGES

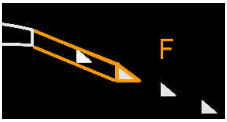


Position of the flaps.
The upper green line shows the position of the outer flaps.
The lower green line shows the position of the inner flaps.



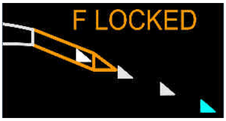
The Flap Load Relief System (FLRS) is active.
Both the green F RELIEF message and the green flap index pulse.

L12



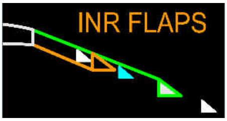
The flaps are failed.
Associated with the following ECAM alert: F/CTL FLAP SYS 1+2 FAULT (*Refer to procedure*).

L12



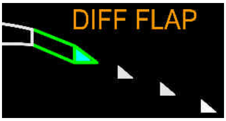
Wing-tip brakes are applied to the flaps.
Associated with the following ECAM alert: F/CTL FLAPS LOCKED (*Refer to procedure*).

L12



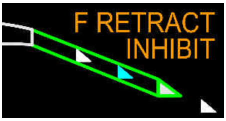
The inner flaps are locked.
Associated with the following ECAM alert: F/CTL INR FLAPS FAULT (*Refer to procedure*).
May also result from a failure of both hydraulic systems.

L12



The DFS function is failed due to a failure in one or both ADGBs, and the FLAP CTL has not been able to realign the inner flap and the outer flap.
Associated with the following ECAM alert: F/CTL DIFF FLAP SETTING FAULT (*Refer to procedure*).

L12

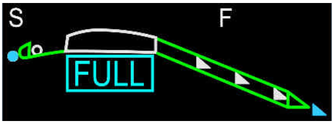


The retraction of the flaps is inhibited by the FLAP CTL due to the failure of one or more spoilers in the downward position.
The amber F RETRACT INHIBIT message appears and the green flap index pulses.

Associated with one of the following ECAM alerts:
- F/CTL PART(MOST) SPLRS FAULT (*Refer to procedure*), or
- F/CTL FLAP RETRACTION INHIBITED (*Refer to procedure*)

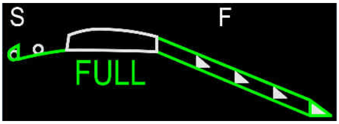
Ident.: DSC-27-20-30-273001-00002119.0001001 / 24 APR 14

FLAPS LEVER POSITION



The slats/flaps move to the selected position.

- FULL Indicates the selected configuration (1, 1+F, 2, 3, or FULL)
-  The blue dot indicates the selected slats position
-  The blue triangle indicates the selected flaps position



The slats/flaps have reached the selected position.

FULL : Indicates the current configuration.

The speeds placard is located on the main instrument panel.
The speeds placard provides the crew with the VFE associated with each slats/flaps configuration.

INHIBITION OF THE FLAP RETRACTION IN THE CASE OF A SPOILER FAILURE

Ident.: DSC-27-20-33-00025344.0001001 / 03 JUL 20
Applicable to: ALL

SYSTEM DESCRIPTION

The Adaptative Droop Hinge Function (ADHF) enables the spoilers to be moved downward, in order to control the gap between the spoiler and the flap. For more information, *Refer to DSC-27-10-10 ADHF Control*.

1 INITIAL FAILURE

In the case of a spoiler failure, the system is designed to avoid an interference between the flap and the spoiler. In addition, the F/CTL PART (MOST) SPLRS FAULT ECAM alert (*Refer to procedure*) appears.

L2 The PRIM memorizes the flap retraction inhibition, therefore the F/CTL FLAPS RETRACTION INHIBITED ECAM alert (*Refer to procedure*) is triggered if the spoilers are recovered.

L1 FAILURE ON GROUND

If the failure occurs on the ground, the PRIM inhibits flap retraction, regardless of the spoiler failure case and the flaps position. This inhibition prevents interference between the spoiler and the flap that may cause noise or scratches.

FAILURE IN FLIGHT

The PRIM inhibits flap retraction from FULL in the case of one of the following spoiler failures:
- The spoiler is in a runaway down position and the flaps are in CONF FULL, or
- The spoiler is jammed in a downward position that may cause interference with the flap.

Note: *For other failure cases, aerodynamic forces push the spoilers up and enable to keep the flap retraction available in flight.*

If the actual slats/flaps position is set to FULL when the alert is triggered, the ECAM displays both of the following lines:

FLAP RETRACTION INHIBITED
SLATS AVAIL

If the actual slats/flaps position is not set to FULL when the alert is triggered, the ECAM displays both of the following lines:

FOR LDG : FLAP LVR 3
FOR GA : KEEP S/F CONF

If the flight crew attempts to retract the flaps, the F RETRACT INHIBIT message appears on the Slats/Flaps display.

AFTER LANDING

After landing, the flaps cannot retract and remain in the landing configuration.
If the flight crew attempts to retract the flaps, the F RETRACT INHIBIT message appears on the Slats/Flaps display.

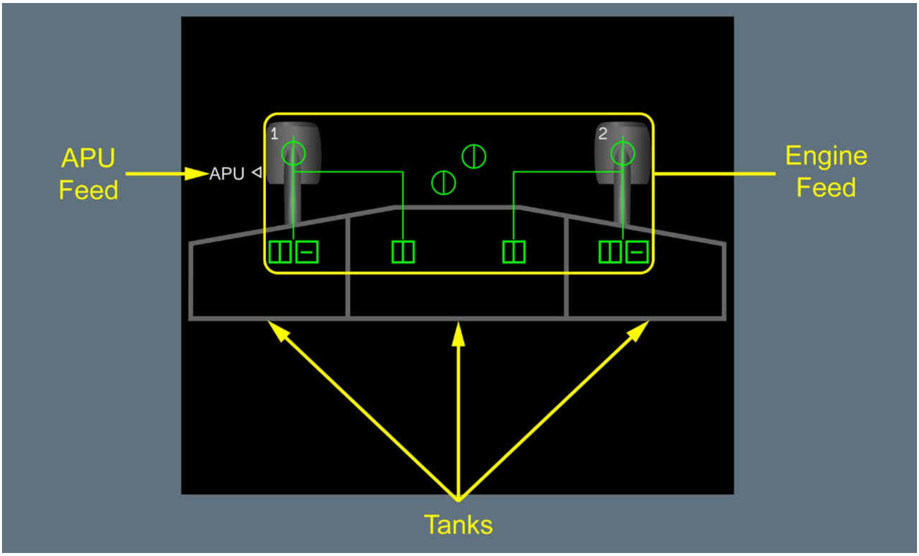
OVERVIEW

Ident.: DSC-28-10-00002600.0001001 / 09 MAR 16
Applicable to: ALL

The fuel system stores fuel and monitors the quantity and temperature of fuel in the tanks to:
- Supply fuel to the engines and to the APU
- Control refueling and defueling
- Enable fuel jettison ◁



TANKS

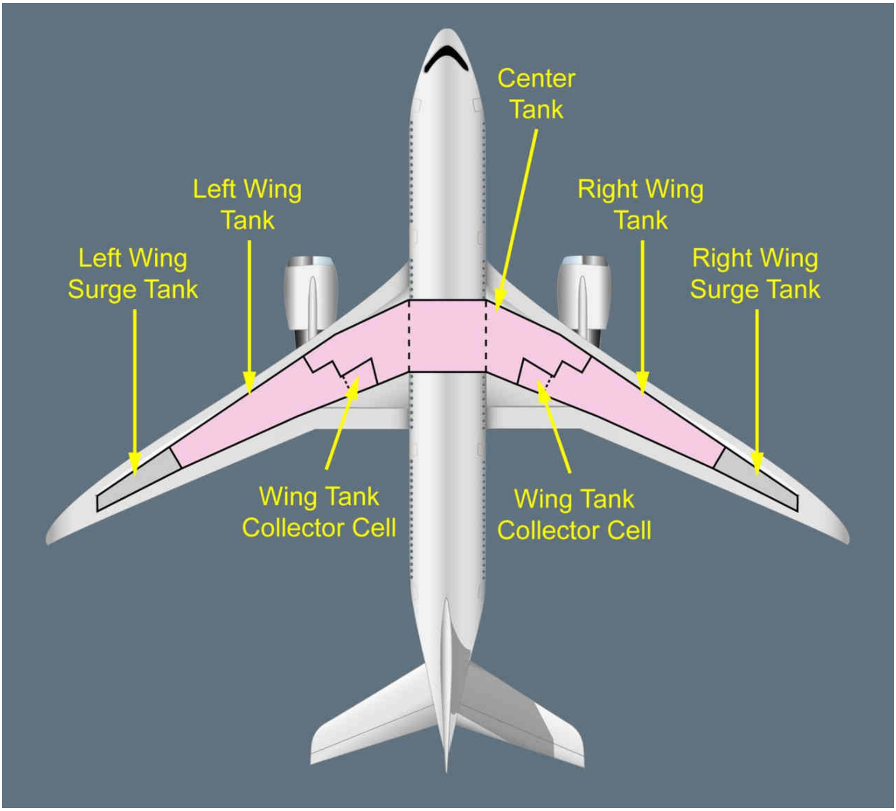
Applicable to: ALL

Ident.: DSC-28-10-DSC2810A-00002601.0001001 / 06 MAR 15

Fuel is stored in the:
- Wings
- Center section of the fuselage.

Fuel tanks, and their components, are symmetrical.

TANK ARRANGEMENT



Center Tank
Left Wing Tank
Right Wing Tank
Left Wing Surge Tank
Right Wing Surge Tank
Wing Tank Collector Cell
Wing Tank Collector Cell

There are three tanks that store fuel:
- 1 tank in each wing
- 1 center tank.

L2 The center tank is divided into three parts:
- The left part is in the inner section of the left wing
- The mid part is the center section of the fuselage
- The right part is in the inner section of the right wing.

Note: *In the center tank, fuel moves freely from part to part.*

L1 Center tank and wing tanks can provide fuel to the engines and the APU.

Each wing tank contains a collector cell that has a fuel capacity of approximately 1 800 kg (3 970 lb).

L2 The collector cell, that is at the lowest point of the wing tank, is permanently filled by gravity to keep the fuel pumps inlets immersed. This design provides low or negative "g" protection to feed the engine.

Note: *Limits between the wing tanks and the center tank are selected so that an engine 1 or 2 rotor burst will not damage the wing tanks.*

Ident.: DSC-28-10-DSC2810A-00002607.0001001 / 06 MAR 15

FUEL TANK QUANTITY

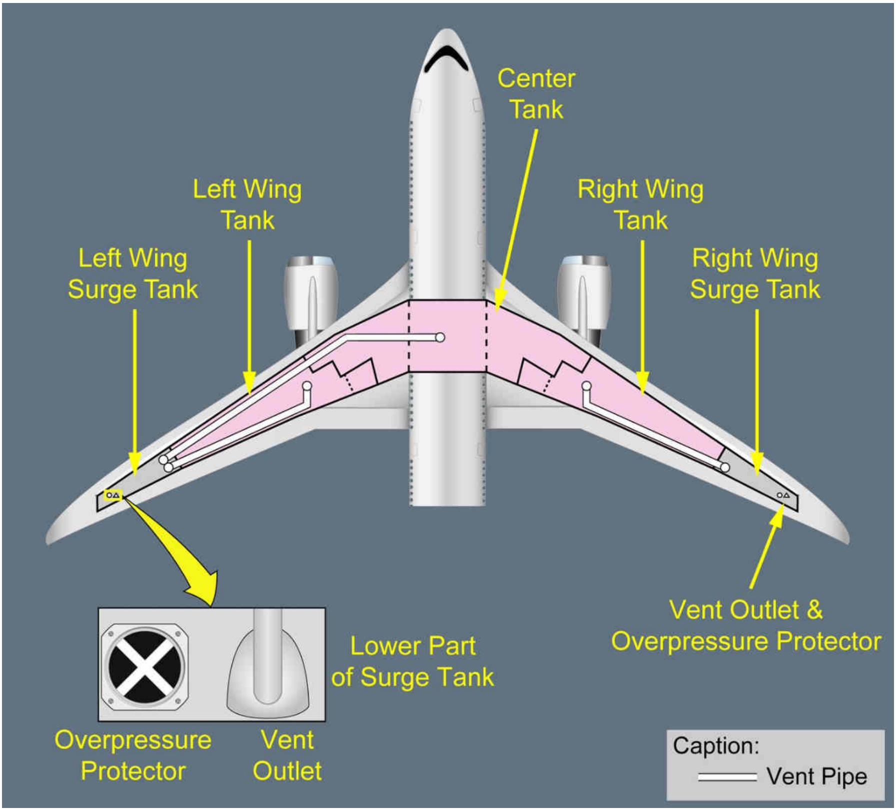
Usable Fuel (Fuel specific density: 0.785 kg/l (6.551 lb/US Gal))			
	Left and Right Wing Tank (each)	Center tank	Total
Volume (approximately)	29 900 l (7 900 US Gal)	80 900 l (21 370 US Gal)	140 700 l (37 170 US Gal)
Weight (approximately)	23 400 kg (51 600 lb)	63 500 kg (140 000 lb)	110 400 kg (243 400 lb)

L2 In cold temperature conditions, the specific density of the fuel can reach a maximum of 0.893 kg/l (7.452 lb/US Gal). With this maximum specific density, the tanks weight is (approximately):
- 26 700 kg (58 860 lb) for the left and right wing tanks (each)
- 72 200 kg (159 200 lb) for the center tank.

L3 Only the quantity of usable fuel appears on the FUEL SD page.
The total quantity of unusable fuel in the fuel system is less than 112 l (30 US Gal) (88 kg (194 lb) for a specific density of 0.785 kg/l (6.551 lb/US Gal)).

L2 SURGE TANK SYSTEM

Surge Tank System



Center Tank
Left Wing Tank
Right Wing Tank
Left Wing Surge Tank
Right Wing Surge Tank
Vent Outlet & Overpressure Protector
Lower Part of Surge Tank
Overpressure Protector
Vent Outlet
Caption:
Vent Pipe

Each wing has a surge tank, between the wing tip and the wing tank.
Each fuel tank connects to the outside atmosphere via these surge tanks. This limits the differential pressure between the tanks and the atmosphere, and maintains the pressure within structural limits.

L3 A vent outlet connects the surge tank with the atmosphere. In the event of over(under-)pressure in the surge tank, an overpressure protector (disc) breaks in the corresponding surge tank. This enables the fuel tanks to be vented into the atmosphere, and maintains the pressure within design limits.

L2 Surge tanks temporarily collect fuel that may overflow from any tank, when the quantity of fuel in that tank is close to the maximum capacity (e.g. If fuel expands by more than 2%, or in case of tight turns during taxi). Fuel that enters the surge tank returns to the wing tank.

L3 Fuel from the surge tank returns to the wing tank, via a dedicated non-return valve.

Ident.: DSC-28-10-DSC2810A-00002609.0001001 / 30 APR 14

L3 WATER MANAGEMENT

WATER SCAVENGING

The water scavenging system includes:
- 1 jet pump in the collector cell of each wing tank associated to the wing tank pumps
- 2 jet pumps associated to each center tank pump in the center tank.

These 6 jet pumps are used to scavenge water from each tank to prevent water from collecting in the tank.

Each jet pump:
- Takes the fuel/water mixture at the low point of the fuel tank
- Redirects the fuel/water mixture to the inlet of its associated engine feed pump.

Note: *The flow of the jet pump is limited in order to meet the maximum water concentration requirements of the engine and the APU.*

WATER DRAINING

The wing tanks and the surge tanks have a water-drain valve at their lowest point. The center tank has two water-drain valves.

These valves are used to:
- For maintenance purpose, sample fuel from the tanks for contamination assessment. This check aims at verifying the correct operation of the water scavenging system.
- Drain water from the tanks.

ENGINE FEED

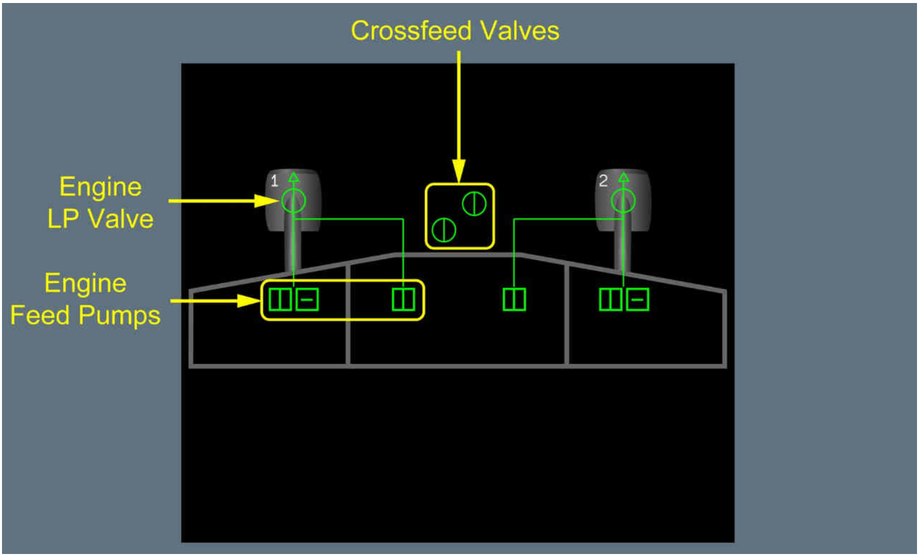
Applicable to: ALL

Ident.: DSC-28-10-DSC2810B-00002603.0001001 / 07 NOV 16

Each wing has two identical fuel pumps (one main and one standby pump). The center tank has two identical pumps (one left and one right pump). Each pump supplies fuel to the onside engine.
If necessary, the crossfeed valves enable any pump to supply fuel to any engine.
Any pump produces enough pressure to supply both engines.

L2 In some cases, engines can be fed by gravity from the associated wing tank, when the aircraft altitude is below the gravity feed ceiling (e.g. FUEL L(R) FEEDLINE BURST *Refer to procedure*).

Engine Feed



Ident.: DSC-28-10-DSC2810B-00002610.0001001 / 05 NOV 18

ENGINE FEED PUMPS

CENTER TANK PUMPS

The center tank pumps produce more pressure within the engine feed gallery than the wing tank pumps. As a result, the center tank pumps preferentially supply fuel to the engines.

L2 In flight, with the two crossfeed valves open and all wing tank pumps running, a single center tank pump preferentially supplies fuel to the two engines

L1 Automatic feed

In normal operation, the CTR TK FEED pb-sw is set to the AUTO position and the FQMS controls the center tank pumps.

The center tank pumps are running when all of the following occur :

- The center tank contains fuel
- The FLAPS lever is set at 0.

L2 After takeoff, the center tank pumps start running a few minutes after the flight crew moves the FLAPS lever to 0.

The fuel in the wing tanks is the last to be used. This provides wing bending moment relief.

L1 Manual feed

As per abnormal procedures, the flight crew can set the CTR TK FEED pb-sw to the MAN position in order to manually control the center tank pumps.

WING TANK PUMPS

The main pumps run continuously.
If a main pump does not deliver sufficient pressure, or is switched off, the corresponding standby pump automatically takes over.
In normal operation, when the center tank is empty, the standby pumps run continuously.

Ident.: DSC-28-10-DSC2810B-00002611.0001001 / 30 APR 14

CROSSFEED VALVES

Two crossfeed valves, that operate in parallel, connect the left and the right side of the engine feed gallery. In normal operation, the two valves are closed.
The two crossfeed valves enable any engine to be fed from any fuel pump, if necessary (e.g. its associated main and standby pumps are off and the center tank is empty).
Crossfeed valves permit the flight crew to manually correct any fuel imbalance in the wing tanks.

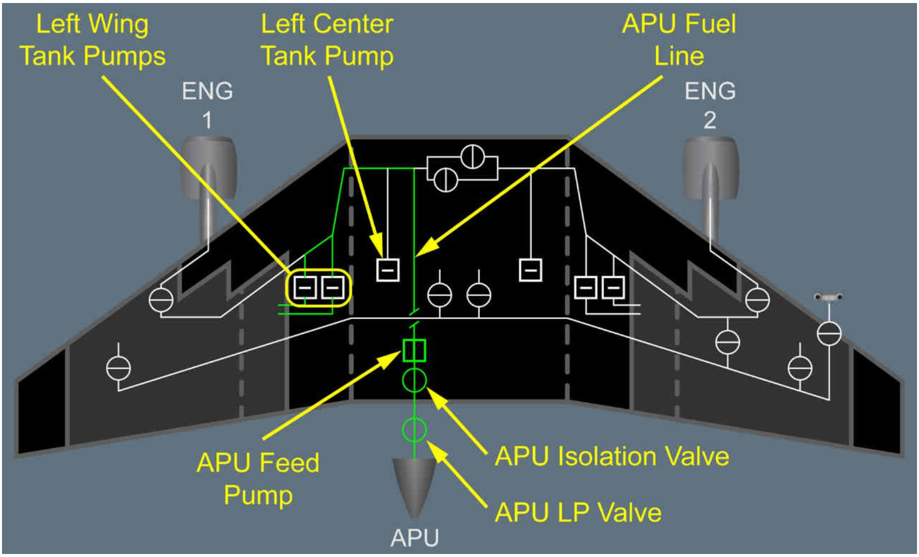
Ident.: DSC-28-10-DSC2810B-00002612.0001001 / 30 APR 14

ENGINE LP VALVES

Each engine has a LP valve, that is used to stop the flow of fuel to the engine.
The ENG MASTER sw controls the LP valve.
The LP valve automatically closes, when the associated ENG FIRE pb is pushed.

APU FEED

Ident.: DSC-28-10-00002604.0001001 / 06 MAY 15
Applicable to: ALL



The engine feed system feeds the APU via its assigned fuel line.

The APU can be fed by:
- The left center tank pump, or
- The main or standby pump of the left wing tank, or
- The right center tank pump, provided that one crossfeed valve is open, or
- The main or standby pump of the right wing tank, provided that one crossfeed valve is open, or
- The APU feed pump, that operates automatically, if required.

L2 The APU feed pump automatically starts to run when the APU is started, and stops when the APU is shutdown.

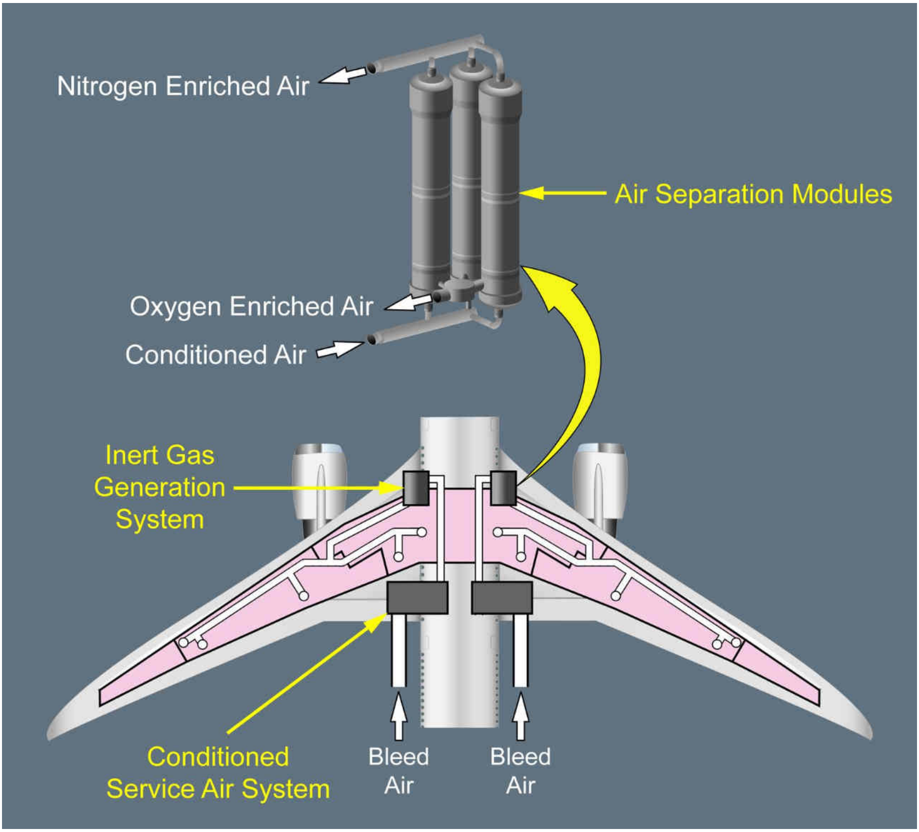
An APU LP valve and an APU isolation valve can isolate the fuel supply to the APU. Both valves close, when the APU FIRE pb is pushed, or when the APU MASTER SW pb-sw is set to off.
If the fuel system detects any damage to the APU feed line, the APU LP valve and APU isolation valve automatically close, to avoid fuel leaks in the fuselage. If running, the APU feed pump is also turned off.

FUEL TANK INERTING SYSTEM

Ident.: DSC-28-10-00011782.0001001 / 05 NOV 18
Applicable to: ALL

The Fuel Tank Inerting System (FTIS) provides a fully automatic protection against fuel tank fire and explosion by creating inert (non-flammable) conditions within the free space of all fuel tanks (i.e. center tank and wing tanks). The objective of the FTIS is to obtain an average oxygen concentration of 12 % or less per tank during all flight phases.

L2 *Note: Standard air contains approximately 21 % of oxygen.*



Nitrogen Enriched Air
Air Separation Modules
Oxygen Enriched Air
Conditioned Air
Inert Gas Generation System
Conditioned Service Air System
Bleed Air
Bleed Air

The Conditioned Service Air System (CSAS) takes bleed air from the engines and supplies pressure and temperature controlled air to the Inert Gas Generation System (IGGS).

The IGGS uses air separation modules to:
- Separate the oxygen from the controlled air provided by the CSAS
- Generate the Nitrogen Enriched Air (NEA), that is a chemically non-reactive gas.

The FTIS provides the NEA to the fuel tanks and discharges the oxygen enriched air overboard.
The IGGS has a symmetrical architecture: The left-hand (right-hand) side of the IGGS takes air from the left-hand (right-hand) CSAS and provides the NEA to the left (right) wing tank and to the center tank.

FUEL QUANTITY MANAGEMENT SYSTEM (FQMS)

L3 There are two FQMS, that control and monitor the fuel system.
The FQMS 1 is hosted on CPIOM H31 and H33.
The FQMS 2 is hosted on CPIOM H32 and H34.

L2 The FQMS:

- Measures the fuel quantity and temperature in the tanks

L3 The FQMS receive fuel tank sensor data, via the Tank Wall Data Concentrators (TWDC). The FQMS compute the fuel quantity in each tank and the fuel temperature in the wing tanks only.

L2
- Computes the GW and the GWCG of the aircraft, based on the ZFW and the ZFCG entered by the flight crew in the FMS
- Monitors the engine feed system
- Controls and monitor the APU feed system
- Monitors manual transfers
- Controls and monitors the fuel jettison system
- Controls and monitors refueling and defueling
- Provide fault detection for the ECAM, and fuel system indication for the FUEL SD page.

L1 One FQMS is active and the other is in standby. If the active FQMS fails, the other takes over.

If both FQMS fail (associated with the following ECAM caution : FUEL FQMS 1+2 FAULT, *Refer to procedure*), the following applies :

- Manual transfers, via the overhead panel, remain available
- Pumps and crossfeed valves control, via the overhead panel, remain available
- All indications on the FUEL SD page, except the fuel quantity, remain available

L2 Depending on the failure case, the fuel quantity may remain available, or be replaced by amber crosses.

L1
- FOB, GW and GWCG display on the Permanent Data remain available

L2 Depending on the failure case: FOB and GW are computed by the CDS, based on the FOB at departure, ZFW and the fuel used. The GWCG is computed by the Weight and Balance Backup Computation (WBBC) function. The FOB, GW and GWCG are displayed with amber dashes.

L1
- Low level, overflow indications remain available
- Fuel usage sequence and lateral imbalance cautions are not available.

Ident.: DSC-28-10-DSC2810D-00002618.0001001 / 30 APR 14

TANK WALL DATA CONCENTRATOR (TWDC)

The TWDC is the interface between the fuel tank sensors and:

- The FQMS
- The FWS (for some system alerts).

There are three TWDCs in the wing tanks and center tank, which collect the following information from in-tank sensors:

- Fuel level
- Fuel density
- Fuel temperature.

L2 FUEL TANK SENSORS

The TWDCs receive information from the following fuel tank sensors:

- Fuel quantity probes

L3 Each fuel tank probe provides the FQMS with the fuel level at a given point in a tank. Fuel quantity probes are installed throughout the wing tanks and the center tank.

L2
- Fuel level sensors

L3 The level sensor determines if the sensor location is in fuel or in air.

The level sensors are:

- In the wing surge tanks, to trigger the following ECAM caution : FUEL L(R) WING TK OVERFLOW (*Refer to procedure*).
- In the wing tanks, to trigger the following ECAM cautions:
  - FUEL L(R) WING TK LEVEL LO,*Refer to procedure*

    Note: The low level caution is totally independent from the fuel quantity that is displayed on the FUEL SD page.

  - FUEL WINGS NOT BALANCED,*Refer to procedure*
  - FUEL FQI FAULT,*Refer to procedure*
  - FUEL AUTO FEED FAULT,*Refer to procedure*
  - FUEL JETTISON FAULT ◁✳ ,*Refer to procedure*.
  - FUEL ABNORM DISTRIBUTION,*Refer to procedure*
- In the center tank, to trigger the following ECAM cautions:
  - FUEL AUTO FEED FAULT,*Refer to procedure*
  - FUEL CTR TK LEVEL LO (when the primary FQI has failed),*Refer to procedure*.

    Note: The low level caution is totally independent from the fuel quantity that is displayed on the FUEL SD page.

  - FUEL ABNORM DISTRIBUTION,*Refer to procedure*

L2 - Fuel Properties Measurement Units (FPMU)

L3 The FPMUs provide fuel density, temperature and electrical characteristics of the uplifted fuel during refuel.
There is one FPMU in the left part of the refuel gallery and one FPMU in the right part of the refuel gallery.

L2 - Probe Dual Temperature (PDT) sensors

L3 When the probe is fully immersed, it provides fuel temperature.
When the probe is partially immersed, it provides fuel level at sensor location.

The PDT sensors are:

- In the wing tanks, to trigger the following ECAM cautions:
  - FUEL TEMP LO,*Refer to procedure*
  - FUEL L(R) WING TK TEMP HI,*Refer to procedure.*
- In the wing tanks and center tank for fuel density computation.

Ident.: DSC-28-10-DSC2810D-00002620.0001001 / 08 JUL 19

WEIGHT AND BALANCE BACKUP COMPUTATION (WBBC)

The WBBC function of each FCDC computes the GW and CG, based on aerodynamic data and on the position of the flight control surfaces.

L2 *Note: The WBBC function computes the GW and CG after slats/flaps retraction. The computation of the CG is no longer available after slats/flaps extension.*

L1 The GW and CG that the WBBC computes are used to:
- Compute flight control laws and characteristic speeds when both FQMS are failed
- Detect differences with the GW and CG that the FQMS computes.

L2 The WBBC uses the following parameters to compute the aircraft GW and CG:
- Altitude
- Mach
- Angle of attack
- The position of the elevators and the trimmable horizontal stabilizer.

L1 In the case of FQMS failure, the GW and GWCG are displayed with amber dashes on the permanent part of the system display.
The primary backup for the display of GW is a CDS computation. If the CDS computation is not available, the GW from the WBBC is used.
The backup for the display of the GWCG is the WBBC computation.
The ECAM indicates the source of the GW and GWCG. For more information *Refer to DSC-28-40 Fuel Gauging Degradation*.

FUEL FLOW INDICATION

L12

3000	Indicates the fuel flow of each engine. Appears in pounds per hour (lbs/h) with the US unit of weight ◁ option. Appears in multiples of 10 kg/h (10 lb/h).
3~~000~~	The value accuracy is degraded.

Ident.: DSC-28-20-DSC2820E-00002784.0001001 / 05 NOV 18

(FOB + FU) - BLOCK INDICATION

L12

Indicates the difference between:
- The current FOB plus the total fuel used by the two engines and the APU, and
- The BLOCK that is the FOB at second engine start.

Appears in pounds (lbs) with the US unit of weight ◁ option.
Appears in multiples of 50 kg (100 lb).

L12

A fuel leak is suspected. The value has diverged sufficiently (between 2.5 t (5 500 lb) and 4 t (8 800 lb) depending on the initial FOB) to suspect a fuel leak.
Associated with the following ECAM alert: FUEL LEAK SUSPECTED (*Refer to procedure*)

Ident.: DSC-28-20-DSC2820E-00002785.0001001 / 03 DEC 15

FUEL USED (FU) INDICATION

L12

Indicates the fuel used by each engine.
This value automatically resets on ground, at the next engine start.
Appears in pounds (lbs) with the US unit of weight ◁ option.
Appears in multiples of 50 kg (100 lb).

The value accuracy is degraded.

EXTERNAL REFUEL PANEL

Applicable to: ALL

Ident.: DSC-28-20-DSC2820D-00002649.0001001 / 30 APR 14

Refueling can be initiated from the cockpit, or from the External Refuel Panel.
L2 The external refuel panel is on the right-hand side of the belly fairing.

Ident.: DSC-28-20-DSC2820D-00002753.0001001 / 06 MAR 15

L3 OVERFLOW LIGHT

Comes on in amber, if there is more than 700 l (185 US Gal) of fuel in any surge tank.

Ident.: DSC-28-20-DSC2820D-00002750.0001001 / 30 APR 14

L3 POWER SUPPLY SW

During refueling/defueling, the fuel system is powered by the external electrical power or by the APU.
If these electrical sources are not available, the fuel system can also be powered by the batteries, by using the POWER SUPPLY sw.

Ident.: DSC-28-20-DSC2820D-00002755.0001001 / 30 APR 14

L3 PRESELECT SW

Increases or decreases the PFQ.

Ident.: DSC-28-20-DSC2820D-00002748.0001001 / 30 APR 14

L3 PRESELECT (PFQ) INDICATOR

Displays the Preselected Fuel Quantity (PFQ) for automatic refueling.

The PFQ is selected via:
- The PRESELECT sw on the refuel panel, or
- The FMS FUEL&LOAD page.

Ident.: DSC-28-20-DSC2820D-00002757.0001001 / 30 APR 14

L3 REFUEL/DEFUEL VALVES SW

The refuel/defuel valves switches open the inlet valve(s) of the associated tank, during manual refueling, manual ground transfer or defueling (the MODE SELECT selector is set to MAN REFUEL, XFR or DEFUEL).

Ident.: DSC-28-20-DSC2820D-00002752.0001001 / 30 APR 14

L3 SHUTOFF TEST SW

When pressed, the shutoff test is initiated:
1. All the lights and displays come on
2. When released, all the inlet valves close, in the same order as during a refuel abort
3. The result of the test appears on the STATUS indicators.

Ident.: DSC-28-20-DSC2820D-00002754.0001001 / 30 APR 14

L3 STATUS INDICATION

The two lines of the STATUS indication display the status of the refuel, transfer or defuel.
The top line displays the current mode.
The bottom line displays any additional message or failure.

Ident.: DSC-28-20-DSC2820D-00002747.0001001 / 30 APR 14

L3 TANK FUEL QUANTITY INDICATION

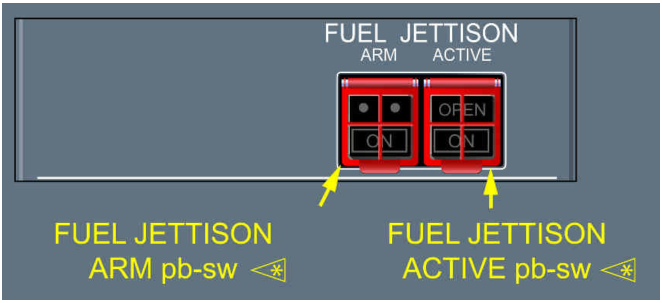
Display the actual fuel quantity in each tank.
The fuel quantity indicators do not display the units. They use the same units that the FQMS uses for cockpit indications (i.e. kg or lbs). Theses units also appear in the ACTUAL and PRESELECT indications on the external refuel panel.

FUEL JETTISON PANEL (IF INSTALLED)

Applicable to: ALL

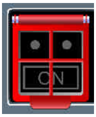
Ident.: DSC-28-20-DSC2820B-00002647.0001001 / 09 MAR 16

FUEL JETTISON Panel

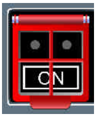


Ident.: DSC-28-20-DSC2820B-00002742.0001001 / 09 MAR 16

FUEL JETTISON ARM PB-SW



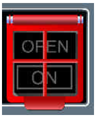
Fuel jettison is not armed.



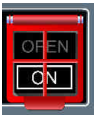
Fuel jettison is armed, and can be activated using the JETTISON ACTIVE pb-sw.

Ident.: DSC-28-20-DSC2820B-00002743.0001001 / 09 MAR 16

FUEL JETTISON ACTIVE PB-SW

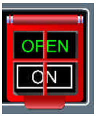


Fuel jettison is not active.



Fuel jettison is selected active. The jettison valves open, if the FUEL JETTISON ARM pb-sw is also ON.

L12



The fuel jettison valves are fully open.
The ON and OPEN lights go off, when the FQMS automatically stops the fuel jettison, or when the flight crew presses the FUEL JETTISON ACTIVE pb-sw or FUEL JETTISON ARM pb-sw again.
For more information: *Refer to DSC-28-40 Fuel Jettison (If Installed)*.

FUEL PANEL

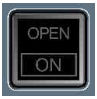
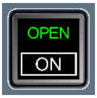
CROSSFEED A(B) PB-SW

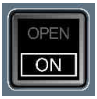


The crossfeed valve is closed.



The CROSSFEED A(B) pb-sw is set to ON and the crossfeed valve is open.

L12

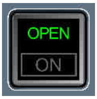


The CROSSFEED A(B) pb-sw is set to ON and the crossfeed valve remains closed.

Associated with one of the following ECAM cautions:
- FUEL CROSSFEED VLV A(B) FAULT (*Refer to procedure*).
- FUEL CROSSFEED VLV A+B FAULT (*Refer to procedure*).

The OPEN /ON lights go off, when the flight crew deselects the CROSSFEED A(B) pb-sw.

L12



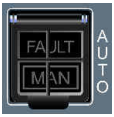
The CROSSFEED A(B) pb-sw is not selected and the crossfeed valve is open.

If the crossfeed valve is abnormally open, this is associated with one of the following ECAM cautions:
- FUEL CROSSFEED VLV A(B) FAULT (*Refer to procedure*).
- FUEL CROSSFEED VLV A+B FAULT (*Refer to procedure*).

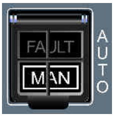
In the case of an electrical emergency configuration, the crossfeed valves can automatically open, without associated alert.

Ident.: DSC-28-20-DSC2820A-00002662.0001001 / 07 NOV 16

CTR TK FEED PB-SW

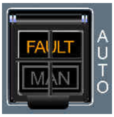


Automatic fuel feeding from the center tank is available.
For more information: *Refer to DSC-28-10 Feed Tank Pumps*



Manual control of the center tank pumps is activated.

L12



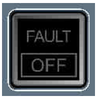
Comes on:
- When the fuel distribution between the center tank and the wing tanks in not correct.
  Associated with the following ECAM alert: FUEL AUTO FEED FAULT (*Refer to procedure*).
- Or, when a low level is detected in one or both of the wing tanks.

  Associated with one of the following ECAM alerts:
  - FUEL L(R) WING TK LEVEL LO (*Refer to procedure*).
  - FUEL L+R WING TK LEVEL LO (*Refer to procedure*).

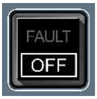
The FAULT light goes off, when the flight crew sets the CTR TK FEED pb-sw to MAN.

Ident.: DSC-28-20-DSC2820A-00002661.0001001 / 09 JUL 15

CTR TK L(R) PB-SW

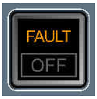


The control of the pump depends on the position of the CTR TK FEED pb-sw:
- If the CTR TK FEED pb-sw is set to AUTO, the pump is automatically commanded.
- If the CTR TK FEED pb-sw is set to MAN, the pump is running.



The pump is off.

L12



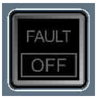
The pump is running at low pressure, or is failed.

Associated with one of the following ECAM alerts:
- FUEL CTR TK L(R) PMP FAULT (*Refer to procedure*)
- FUEL CTR TK L+R PMPS FAULT (*Refer to procedure*)

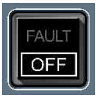
The FAULT light goes off, when the flight crew sets the CTR TK L(R) pb-sw to OFF.

Ident.: DSC-28-20-DSC2820A-00002657.0001001 / 30 APR 14

L(R) TK MAIN PB-SW

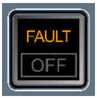


The main pump is running.



The main pump is off.

L12



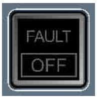
The main pump is running at low pressure.

Associated with one of the following ECAM alerts:
- FUEL L(R) TK MAIN PMP FAULT (*Refer to procedure*)
- FUEL L(R) TK MAIN+STBY PMPS FAULT (*Refer to procedure*)

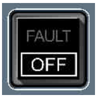
The FAULT light goes off, when the flight crew sets the L(R) TK MAIN pb-sw to OFF.

Ident.: DSC-28-20-DSC2820A-00002658.0001001 / 09 JUL 15

L(R) TK STBY PB-SW

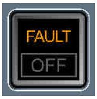


The standby pump runs automatically.



The standby pump is off.

L12



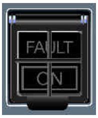
The standby pump is running at low pressure.

Associated with one of the following ECAM alerts:
- FUEL L(R) TK STBY PMP FAULT (*Refer to procedure*)
- FUEL L(R) TK MAIN+STBY PMPS FAULT (*Refer to procedure*)

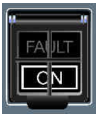
The FAULT light goes off, when the flight crew sets the L(R) TK STBY pb-sw to OFF.

Ident.: DSC-28-20-DSC2820A-00011615.0001001 / 30 APR 14

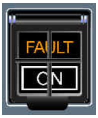
L(R) TK XFR PB-SW



The transfer path between the wing tank and the center tank is closed. Tanks are segregated.



Fuel transfers by gravity from the wing tank to the center tank, via the refuel gallery.



Fuel gravity transfer from the wing tank to the center tank failed.
The FAULT light and the ON light go off, when the flight crew presses the L(R) TK XFR pb-sw.

FUEL SD PAGE

Ident.: DSC-28-20-00002650.0001001 / 28 APR 17
Applicable to: ALL

The FUEL SD page provides the flight crew with information on the fuel system, and indicates the:
- Status of the fuel system components that are in use (e.g.: pumps, transfer paths)
- Fuel temperature in each wing tanks
- Quantity of fuel in each tank
- Quantity of fuel used
- Fuel flow value.

APU INDICATION

L12

When there is no indication, fuel is not fed to the APU.
The APU LP valve and/or the APU isolation valve are closed.

L12

Fuel is fed to the APU.
The APU LP valve and the APU isolation valve are open.

L12

Fuel is abnormally fed to the APU.
The APU LP valve and the APU isolation valve are abnormally open.

L12

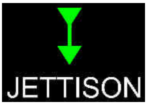
Fuel is abnormally not fed to the APU.

- The APU LP valve and/or the APU isolation valve are abnormally closed,
  Associated with the following ECAM alert: FUEL APU FEED FAULT (*Refer to procedure*).
- Or, the APU feed line is damaged.
  Associated with the following ECAM alert: FUEL APU LINE FAULT (*Refer to procedure*).

Ident.: DSC-28-20-DSC2820I-00002761.0001001 / 09 MAR 16

JETTISON INDICATION

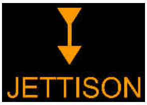
When there is no indication, there is no jettison in progress.



Jettison is active. The jettison valves are open.

L12

Jettison is activated, but the jettison failed.
Associated with the following ECAM alert: FUEL JETTISON FAULT (*Refer to procedure*).



Either jettison valve is abnormally open.

Ident.: DSC-28-20-DSC2820I-00002762.0001001 / 30 APR 14

OVERFLOW INDICATION

L12

OVFLW	Appears when an overflow in the left or right wing surge tank is detected. Associated with the following ECAM alert: FUEL L(R) WING TK OVERFLOW (*Refer to procedure*) The indication disappears, when the overflow is no longer detected. Associated with the following ECAM alert: FUEL OVERFLOW CORRECTED (*Refer to procedure*)

Ident.: DSC-28-20-DSC2820I-00011870.0001001 / 28 APR 17

LVL LO INDICATION

L12

LVL LO	Appears when a low level in the left and/or right wing tank is detected. Associated with one of the following ECAM alerts: - FUEL L(R) WING TK LEVEL LO (*Refer to procedure*) - FUEL L+R WING TK LEVEL LO (*Refer to procedure*)

Ident.: DSC-28-20-DSC2820I-00002763.0001001 / 30 APR 14

ENGINE NUMBER INDICATION

1	Engine 1(2) is running.
1	Engine 1(2) is not running.

Ident.: DSC-28-20-DSC2820I-00002764.0001001 / 30 APR 14

LEAK INDICATION

L12

LEAK	Appears when a fuel leak is detected. Associated with the following ECAM alert: FUEL LEAK SUSPECTED (*Refer to procedure*)

Note: *The ECAM will not display the FUEL LEAK SUSPECTED alert if the communication between the FQMS and the FWS is failed. In this case, the flight crew can activate the FUEL LEAK ECAM not-sensed alert.*

(FOB + FU) - BLOCK INDICATION

L12

Indicates the difference between:
- The current FOB plus the total fuel used by the two engines and the APU, and
- The BLOCK that is the FOB at second engine start.

Appears in pounds (lbs) with the US unit of weight ◁✱ option.
Appears in multiples of 50 kg(100 lb).

L12

A fuel leak is suspected. The value diverged sufficiently (between 2.5 t (5 500 lb) and 4 t (8 800 lb) depending on the initial FOB) to suspect a fuel leak.
Associated with the following ECAM alert: FUEL LEAK SUSPECTED (*Refer to procedure*)

WING TANKS - FUEL QUANTITY INDICATION

L12

The fuel quantity in the wing tank is within a normal range.
Appears in pounds (lbs) with the US unit of weight ◁ option.
Appears in multiples of 20 kg (50 lb).

L12

The value accuracy is degraded.
For more information *Refer to DSC-28-40 Fuel Gauging Degradation*.

L12

The fuel quantity in the left wing tank is not balanced with the fuel quantity in the right wing tank.
Associated with the following ECAM alert: FUEL WINGS NOT BALANCED (*Refer to procedure*)
When the fuel is balanced, the FUEL IMBALANCE CORRECTED (*Refer to procedure*) caution appears.

L12

Some of the fuel in the wing tank is not usable.
Associated with the following ECAM alert: FUEL L(R) TK MAIN+STBY PMPS FAULT (*Refer to procedure*)

The fuel in the wing tank is not usable.

Ident.: DSC-28-20-DSC2820G-00011872.0001001 / 03 JAN 20

CENTER TANK - FUEL QUANTITY INDICATION

L12

The fuel quantity in the center tank is within a normal range.
Appears in pounds (lbs) with the US unit of weight ◁ option.
Appears in multiples of 20 kg (50 lb).

L12

The value accuracy is degraded.
For more information *Refer to DSC-28-40 Fuel Gauging Degradation*.

L12

The fuel in the center tank is not usable.
Associated with the following ECAM alert: FUEL CTR TK L+R PMPS FAULT (*Refer to procedure*)

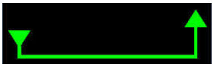
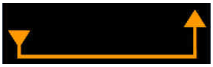
WING TANK TO CENTER TANK TRANSFER INDICATION

When there is no indication, there is no fuel transfer in progress.



Fuel gravity transfer from the wing tank to the center tank.
The ECAM displays the L(R) TK XFR IN PROGRESS memo.



Abnormal fuel gravity transfer from the wing tank to the center tank.

Ident.: DSC-28-20-DSC2820H-00002782.0001001 / 30 APR 14

CROSSFEED VALVE

The crossfeed valve is closed.

The crossfeed valve is open.
If at least one crossfeed valve is open, the ECAM displays the CROSSFEED OPEN memo.
During takeoff, this memo is in amber.

L12

The crossfeed valve is abnormally closed.

Associated with one of the following ECAM alerts:
- FUEL CROSSFEED VLV A(B) FAULT (*Refer to procedure*).
- FUEL CROSSFEED VLV A+B FAULT (*Refer to procedure*).

L12

The crossfeed valve is abnormally open.

Associated with one of the following ECAM alerts:
- FUEL CROSSFEED VLV A(B) FAULT (*Refer to procedure*).
- FUEL CROSSFEED VLV A+B FAULT (*Refer to procedure*).

FUEL ON BOARD INDICATION

L12

l fuel quantity on board the aircraft.
Appears in pounds (lbs) with the US unit of weight ◁ option.
Appears in multiples of 100 kg (100 lb).

L12

value accuracy is degraded.
For more information, *Refer to DSC-28-40 Fuel Gauging Degradation*

e fuel in at least one tank is not usable.

Ident.: DSC-28-20-DSC2820F-00020982.0001001 / 03 DEC 15

GROSS WEIGHT INDICATION

L12

Gross Weight of the aircraft computed by the FQMS.
Appears in pounds (lbs) with the US unit of weight ◁ option.
Appears in multiples of 100 kg (100 lb).

L12

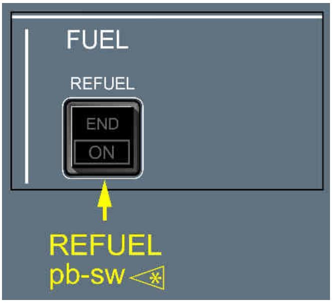
The value accuracy is degraded. The Gross Weight is computed by the CDS or by the WBBC.
For more information, *Refer to DSC-28-40 Fuel Gauging Degradation*

REFUEL PANEL (IF INSTALLED)

Applicable to: ALL

Ident.: DSC-28-20-DSC2820C-00002648.0001001 / 09 MAR 16

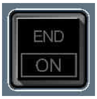
Refuel Panel



Ident.: DSC-28-20-DSC2820C-00002745.0001001 / 09 MAR 16

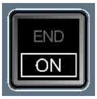
REFUEL PB-SW

The ground crew or the flight crew can use the REFUEL pb-sw in the cockpit, in order to initiate refueling. Refueling from the cockpit has priority over refueling initiated from the external refuel panel.



Refueling from the cockpit is not active.
When pressed, the ON light comes on, and refueling from the cockpit is enabled.

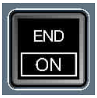
L12



Refueling from the cockpit is enabled.
When pressed, the ON light goes off, and refueling stops.

Note: *The automatic refuel function will uplift the fuel quantity that corresponds to the BLOCK entry field from the ACTIVE/FUEL&LOAD page of the FMS, or to the preselected fuel quantity (PFQ) from the external refuel panel.*

L12



Refueling from the cockpit is completed or aborted.
When pressed, both the END light and the ON light go off.
In the case of an aborted refueling, the END light is associated with the following ECAM alert: FUEL REFUEL FAULT (*Refer to procedure*).

(FOB + FU) - BLOCK

Ident.: DSC-28-30-00024859.0001001 / 08 JUL 19
Applicable to: ALL

DESCRIPTION

As part of regular fuel checks, the flight crew compares the quantity of fuel used (FU) versus the quantity of fuel that is no longer in the fuel tanks (BLOCK-FOB).
In order to ease this computation, the CDS permanently displays the (FOB + FU) - BLOCK indication on both the CRUISE page and FUEL SD page.

COMPUTATION

The FOB is the current fuel on board, measured by the FQI probes and indicated on the ECAM Permanent Data.
The FU is the total fuel used by the two engines and the APU. The value is computed from the measured fuel flow and initialized after the start of the second engine.
The BLOCK is the FOB that the CDS memorizes at the start of the second engine. The memorization is performed in the Display Unit (DU) that displays the (FOB + FU) - BLOCK indication.

Therefore, the (FOB + FU) - BLOCK indication is not available (displays XX):
- Before the start of the second engine, and
- After the shutdown of the DU that displays the (FOB + FU) - BLOCK indication.

L2 In the case of a DU reset, the (FOB + FU) - BLOCK indication is no longer available. The (FOB + FU) - BLOCK indication is recovered at next start of the second engine, when the CDS memorizes a new BLOCK parameter.

L1 FLUCTUATING VALUE

The flight crew may notice a normal fluctuation of the (FOB + FU) - BLOCK indication (approximately +/- 1 200 kg (2 600 lb)). This fluctuation is due to the combination of the accuracy of the gauging system (used to compute the FOB and the BLOCK) and the accuracy of the fuel flowmeter (used to compute the FU).
If the value is abnormally negative, the flight crew may suspect a fuel leak.
L2 For more information, *Refer to DSC-28-40 Fuel System Leak Detection*.
L1 If the value is abnormally positive, the flight crew may suspect a fuel quantity over reading.

Intentionally left blank

MANUAL TRANSFER FROM WING TANK TO CENTER TANK

Ident.: DSC-28-40-00002812.0001001 / 06 MAY 15
Applicable to: ALL

In normal operation, fuel transfer from a wing tank to the center tank is not required. However, the flight crew can initiate a manual gravity transfer, via the FUEL overhead panel, as requested by ECAM procedures.

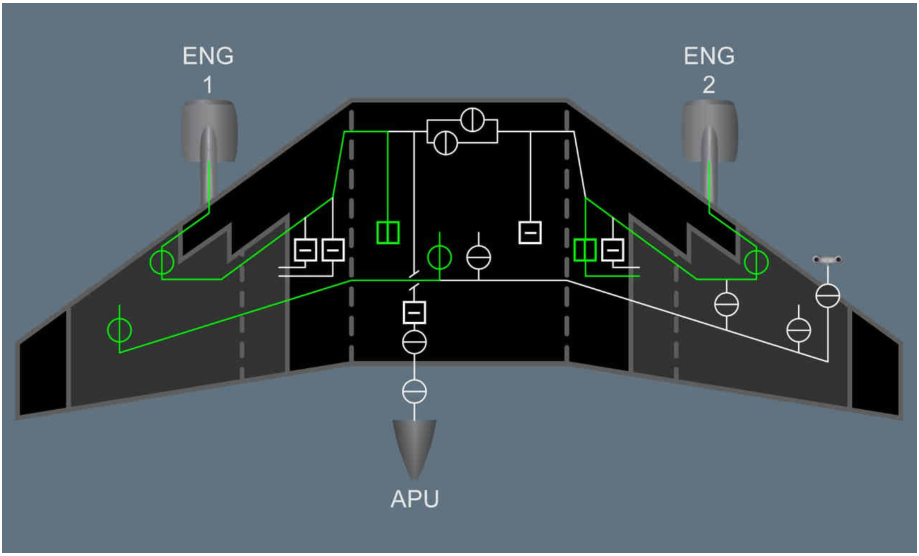
L2 Some failure conditions that induce the loss of all fuel pumps in a wing, require a manual fuel transfer from the affected wing tank to the center tank. This gravity transfer ensures that, for these failure conditions, a large quantity of the wing tank fuel remains available to feed the engines.

Note: 3 000 kg (6 600 lb) of the wing tank fuel cannot be transferred to the center tank.

L1 A manual transfer is only possible from any wing tank to the center tank.

L2 The flight crew initiates the gravity transfer from the left (right) wing tank, by setting the L(R) TK XFR pb-sw to ON.

Manual Gravity Transfer



L3 Fuel :
- Exits the left (right) wing tank via the inlet valve, that is used as an outlet valve
- Transfers by gravity from the left (right) wing tank to the center tank via the refuel gallery
- Enters the center tank via the left (right) inlet valve.

FUEL JETTISON ⩤

Ident.: DSC-28-40-00002813.0001001 / 08 JUL 19
Applicable to: ALL

To rapidly reduce the aircraft gross weight, the jettison system can be used to discharge fuel overboard. The output rate is approximately 60 000 kg/h (132 000 lb/h).
Fuel is jettisoned simultaneously from the wing tanks and the center tank, if the center tank contains fuel.

Note: *The jettison system enables to reduce the aircraft gross weight from MTOW to MLW in less than 60 min.*

JETTISON OPERATION

In accordance with the procedure (*Refer to PRO-ABN-FUEL [ABN] FUEL JETTISON (If Installed)*), to initiate fuel jettison, the flight crew:

- Enters the jettison final gross weight in the FMS FUEL&LOAD page (For information on the FUEL&LOAD page, *Refer to DSC-22-FMS-20-20-20 FUEL&LOAD Page*)
- Presses the JETTISON ARM pb-sw and the JETTISON ACTIVE pb-sw on the FUEL JETTISON panel (*Refer to DSC-28-20 FUEL JETTISON panel (if installed)*).

Note: *Jettison starts as soon as both pushbuttons are pressed, even if no jettison final gross weight has been entered. The jettison final gross weight can be entered or updated at any time.*

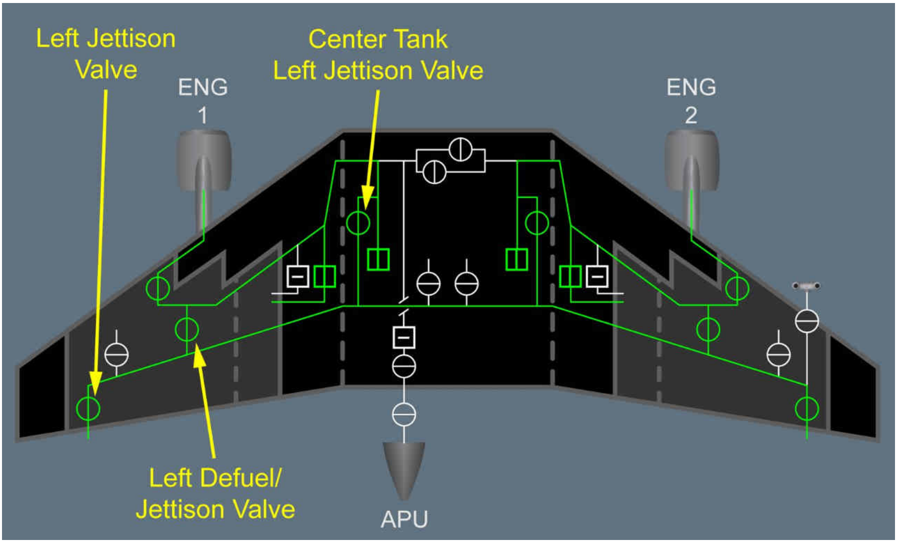
Note: *Jettison cannot be initiated during a manual transfer from a wing tank to the center tank .*

L2 When fuel jettison is initiated:

- The engine feed gallery connects to the refuel gallery via:
  - The defuel/jettison valves in the wing tanks
  - The center tank jettison valves, if the center tank contains fuel
- The jettison valves open.
  There are two jettison valves, that are on the refuel gallery. These jettison valves connect the refuel gallery to two discharge points through which the fuel is jettisoned. There is one discharge point on the trailing edge of each wing.

The FQMS controls and monitors the fuel jettison. All tanks that contain fuel are emptied simultaneously.
L3 For redundancy, each jettison valve has two motors with different electrical supplies.

Fuel Jettison



L1 JETTISON TERMINATION

Jettison stops when one of the following occurs:

- The gross weight reaches the jettison final gross weight that the flight crew entered in the FMS FUEL&LOAD page

L2 The FQMS stops the jettison, and the FUEL JETTISON COMPLETED procedure appears on the ECAM (*Refer to procedure*).

L1
- The flight crew press any of the two JETTISON pushbuttons on the FUEL JETTISON panel
- The FOB reaches 10 000 kg (22 000 lb).

L2 The FQMS stops jettison, and the FUEL JETTISON COMPLETED procedure appears on the ECAM (*Refer to procedure*).

FUEL SYSTEM IN ELECTRICAL EMERGENCY CONFIGURATION

Ident.: DSC-28-40-00002814.0001001 / 08 JUL 19
Applicable to: ALL

The following describes the operation of the fuel pumps and valves, in the event of an electrical emergency configuration (*Refer to PRO-ABN-ELEC ELEC EMER CONFIG*):

- The standby pump of each wing tank and both center tank pumps are inoperative,
- The crossfeed valves remain operative,
- The main pump of each wing tank remain operative.

In addition:
- During slat/flaps extension, or when the speed is lower than 175 kt, the main pump of the right wing tank stops and the crossfeed valves open,
- During landing gear extension, the main pump of each wing tank stop. Fuel is fed by gravity from the wings.

If the electrical emergency configuration is due to a failure of both engines:
- Regardless of the speed, the main pump of the right wing tank stops and the crossfeed valves open,
- During landing gear extension or when the speed is lower than 175 kt, the two main pumps of each wing tank stop. Fuel is fed by gravity from the wings.

FUEL GAUGING DEGRADATION

Ident.: DSC-28-40-00002815.0001001 / 03 JAN 20
Applicable to: ALL

Fuel tank sensors are in all the tanks, for fuel quantity computation.
In normal operations, the FQMS uses the tanks sensors via the TWDCs to compute the fuel tank quantities.

L2 When all tank sensors are available, the accuracy error of the fuel quantity indications on the FUEL SD page is less than ± 1 % of tank capacity (on ground and in flight). During high pitch angle phases (more than 10 ° nose down or more than 15 ° nose up), the fuel gauging accuracy may normally decrease down to ± 3 % of the fuel tank capacity.

L1 FQI DEGRADED

If some tank sensors fail in a tank (e.g. FQI probes), the FQMS is still able to compute the fuel tank quantities, but the accuracy is degraded.

In this case:
- The fuel quantity of the affected tank appears with amber dashes
- FOB, GW and GWCG appear with amber dashes.

If any tank FQI accuracy is degraded, the fuel leak detection is not operative.

L2 Associated with the following ECAM alert: FUEL LEAK DET FAULT (*Refer to procedure*).

L1 The table below provides the accuracy error for each tank:

Affected Tank	Accuracy Error with FQI Degraded (Average Fuel Density)			
	Empty Tank[(1)]		Full Tank[(1)]	
	Additional Error compared to Normal Accuracy[(2)]	Maximum Error[(3)]	Additional Error compared to Normal Accuracy[(2)]	Maximum Error[(3)]
Wing Tank	250 kg (550 lb)	500 kg (1 100 lb)	500 kg (1 100 lb)	1 000 kg (2 200 lb)

Continued on the following page

Continued from the previous page

Affected Tank	Accuracy Error with FQI Degraded (Average Fuel Density)			
Center Tank A350-900	650 kg (1 400 lb)	1 300 kg (2 850 lb)	1 300 kg (2 850 lb)	2 600 kg (5 700 lb)
Center Tank A350-1000	800 kg (1 750 lb)	1 600 kg (3 500 lb)	1 600 kg (3 500 lb)	3 200 kg (7 050 lb)
Center Tank A350-900 ULR	850 kg (1 850 lb)	1 700 kg (3 750 lb)	1 700 kg (3 750 lb)	3 400 kg (7 500 lb)

(1) *There is a linear evolution of the accuracy values from empty tank to full tank.*

(2) *The degraded FQI causes an additional error compared to normal FQI.*
The flight crew may use this value to estimate the potential over reading that the FQI degraded provides compared to normal FQI.

(3) *The column 'Maximum Error" provides the accuracy error with FQI degraded. This is the absolute value, not compared with normal FQI.*

FQI FAILED

If many tank sensors fail, the FQMS is no longer able to compute the fuel quantity of the affected tank.

In this case:
- The ECAM triggers the FUEL FQI FAULT alert
- The fuel quantity of the affected tank is lost (replaced by amber crosses).
- If the FOB is computed by the CDS, based on the FOB at departure and the Fuel Used, the ECAM displays FOB COMPUTED FROM FU and FOB appears with amber dashes. In all other cases, FOB is lost (replaced by amber crosses).
- If the GW is computed by:
  - The CDS, based on the FOB and the ZFW, the ECAM displays GW COMPUTED FROM FU
  - The WBBC, the ECAM displays GW FROM WBBC

  In theses cases, the GW appears with amber dashes.
  In all other cases, the GW is lost (replaced by amber crosses).
- If the GWCG is computed by the WBBC, the ECAM displays GWCG FROM WBBC and the GWCG indication appears with amber dashes. In all other cases, the GWCG is lost (replaced by amber crosses).

FUEL QUANTITY: MONITORING AND INTEGRITY CHECK

Ident.: DSC-28-40-00023248.0001001 / 14 APR 16
Applicable to: ALL

The fuel system includes all of the following:
- Fuel quantity probes, that compute the fuel quantity in the tanks
- Fuel level sensors, that indicate if there is some fuel in specific areas of the tanks. A fuel level sensor has two states : Either dry or wet.

L2 The following are the approximate fuel quantities that correspond to each fuel level sensor:
- Three levels of detection in each wing tank:
  - 18 000 kg (39 600 lb) of fuel
  - 4 500 kg (9 900 lb) of fuel
  - 1 600 kg (3 500 lb) of fuel.
- In the center tank:
  - 1 850 kg (4 080 lb) of fuel.
- In each surge tank:
  - 550 kg (1 200 lb) of fuel.

L1 In order to check the integrity of the fuel quantity, the fuel system permanently checks that the fuel quantity that is indicated on the FUEL SD page (from the fuel quantity probes) is consistent with the state (dry or wet) of the fuel level sensors. If both inputs disagree, the FUEL FQI FAULT ECAM caution (*Refer to procedure*) is triggered.

The fuel system also uses the fuel level sensors to trigger all of the following ECAM cautions, independently of the fuel quantity that is indicated on the FUEL SD page:
- FUEL L(R) WING TK LEVEL LO (*Refer to procedure*)
- FUEL CTR TK LEVEL LO (*Refer to procedure*)
- FUEL AUTO FEED FAULT (*Refer to procedure*)
- FUEL L(R) WING TK OVERFLOW (*Refer to procedure*).

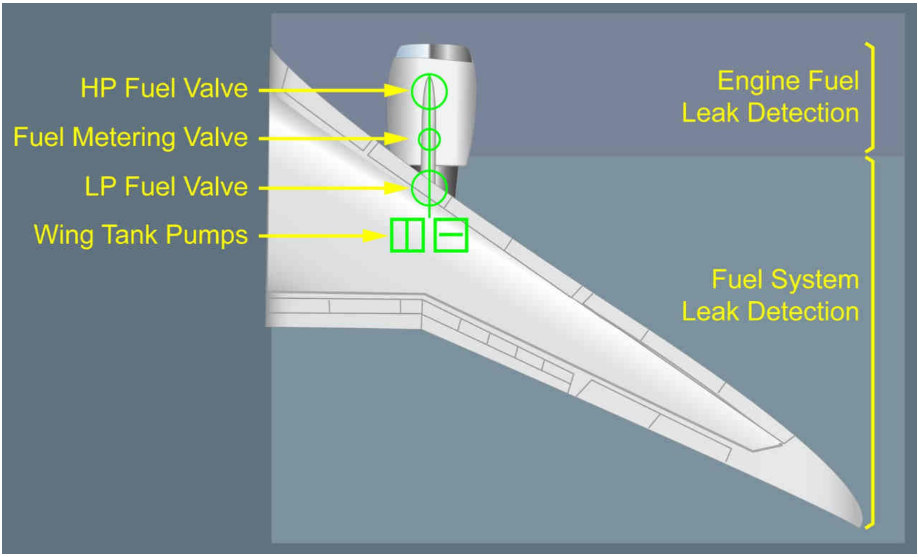
FUEL LEAK DETECTION

Applicable to: ALL

Ident.: DSC-28-40-2840A-00002816.0001001 / 06 MAY 15

Fuel leaks may occur either in the fuel system (e.g. tanks, feedline burst) or in the engine fuel system (i.e. downstream of the fuel metering valve).

Fuel Leak Detection



A leak in the fuel system:
- Is detected by an increasing difference between the BLOCK fuel and the sum of the Fuel On Board (FOB) and the Fuel Used (FU)
- L2 Is detected by the FQMS (*Refer to Fuel System Leak Detection*)
- L1 Triggers the following ECAM caution: FUEL LEAK SUSPECTED (*Refer to procedure*).

A leak in the engine fuel system:
- Is detected by an abnormally high fuel flow on one engine
- L2 Is detected by the Engine Interface Function (*Refer to Engine Fuel Leak Detection*)
- L1 Triggers the following ECAM caution: ENG 1(2) FUEL LEAK SUSPECTED (*Refer to procedure*).

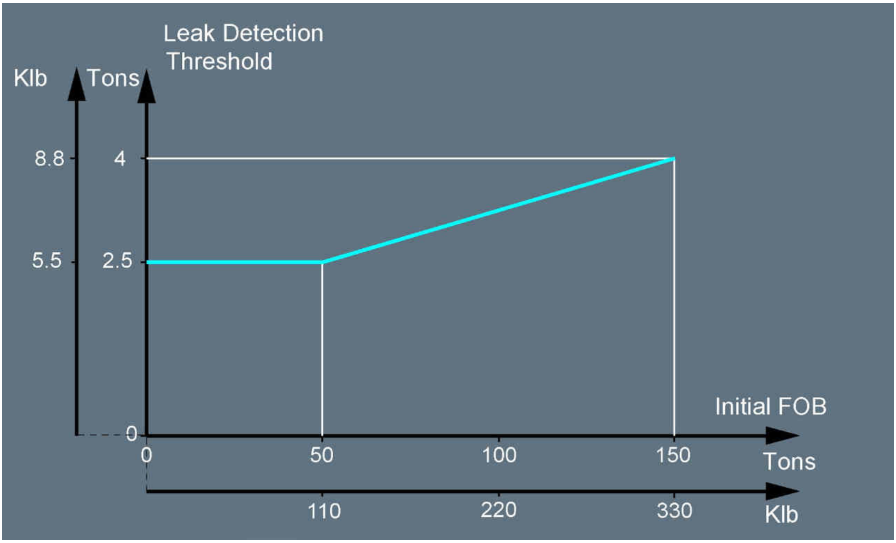
Ident.: DSC-28-40-2840A-00002827.0001001 / 09 MAR 16

L2 FUEL SYSTEM LEAK DETECTION

The FQMS performs the fuel system leak detection.
The leak detection function compares the BLOCK fuel with the sum of the FOB and the Fuel Used (by the engines and the APU). If the difference is above a predefined threshold, the ECAM triggers the FUEL LEAK SUSPECTED alert (*Refer to procedure*).

L3 The predefined threshold takes into account the measurement errors of the fuel quantities and fuel used. The threshold is set at the second engine start and is fixed for the entire flight.

L2 The leak detection threshold is defined as follows:



L3

Initial FOB	Leak Detection Threshold
0 kg	2 500 kg (5 500 lb)
50 000 kg (110 000 lb)	2 500 kg (5 500 lb)
150 000 kg (330 000 lb)	4 000 kg (8 800 lb)

L2 The fuel system leak detection is inhibited for the remainder of the flight in the case of:
- Fuel jettison ⩤ ,
- Loss or degradation of any engine Fuel Used,
- Failed of degraded Fuel Quantity Indications (FQI) of any tank.

When the fuel system leak detection is not available, the ECAM triggers the following alert : FUEL LEAK DET FAULT (*Refer to procedure*).
The fuel system leak detection is temporarily inhibited in the case of an abnormal flight attitude.
The detection is recovered if the aircraft comes back within the normal flight envelope.

Ident.: DSC-28-40-2840A-00002828.0001001 / 06 MAY 15

L2 ENGINE FUEL LEAK DETECTION

The Engine Interface Function (EIF) performs the engine fuel leak detection.
The engine fuel leak detection is based on the comparison between the fuel flows from both engines.

L3 The engine fuel leak detection is available when all of the following occur:
- Both engines are running,
- The aircraft is in climb or cruise phase,
- Both thrust levers are set in the CLB detent,
- The fuel flow measurement of both engines is neither degraded nor lost,
- The aircraft is not in the following situation : below FL 290 and N1 below 44 % on both engines.

L2 DETECTION OF LOW FUEL LEAKS

If one fuel flow is 30 % more than the other fuel flow during a confirmation time, the ECAM triggers the ENG 1(2) FUEL LEAK SUSPECTED alert (*Refer to procedure*). The confirmation time depends on the difference between the fuel flows (the confirmation time decreases when the difference between the fuel flows increases).

DETECTION OF LARGE FUEL LEAKS

If one fuel flow is 3.8 times more than the other fuel flow during 4 min, the ECAM triggers the ENG 1(2) FUEL LEAK SUSPECTED alert (*Refer to procedure*).

Intentionally left blank

REFUEL/DEFUEL SYSTEM

ENG 1
ENG 2
Second Refuel Coupling ◁
Refuel Isolation Valve
Wing Tank Inlet Valve
Center Tank Inlet Valve
Defuel Valve

REFUEL COUPLINGS

One refuel coupling is installed under the right wing.
A second refuel coupling ◁ is installed under the left wing.
One or two refueling hoses can be attached to each coupling.
Each refuel coupling is connected to the refuel gallery via the refuel isolation valve.
It takes approximately 25 min to uplift 47 t (103 600 lb) of fuel with two hoses and a refuel pressure of 40 PSI.
L3 It is not possible to achieve gravity refueling.

L1 VALVES INSTALLED WITH THE JETTISON ◁ OPTION

Defuel/Jettison Valves

By default, there is one defuel valve in the right wing that connects the engine feed gallery and the refuel gallery. When the jettison option is installed, this valve is called the defuel/jettison valve. A second defuel/jettison valve is also installed in the left wing.

The defuel/jettison valves open during the defuel and the jettison operations.

Center Tank Jettison Valves

Two center tank jettison valves connect the engine feed gallery and the refuel gallery. The center tank jettison valves open during the defuel and the jettison operations.

REFUEL

Automatic Refuel

In normal operations, the FQMS controls the refuel operations.
The refuel can be initiated either from the cockpit, or from the External Refuel Panel (ERP).
L2 For aircraft equipped with REFUEL pb-sw ⊲, the Preselect Fuel Quantity (PFQ) is the last entered value between the ERP or the BLOCK value. As a consequence, the PFQ changes if the flight crew updates the BLOCK value of the FMS FUEL & LOAD Page during refueling.

For more information about the automatic refueling procedure,*Refer to PRO-NOR-SUP-SUP-FUEL Automatic Refueling*.

L3 When the refueling is initiated, the FQMS determines the refuel distribution and the refuel isolation valves open. The inlet valves of all the tanks that require refueling open, and all these tanks are refueled simultaneously. The inlet valves close in sequence when the required quantity is reached, or when a high level is detected.
The FQMS automatically stops the refueling when the FOB is equal to the Preselected Fuel Quantity (PFQ) (+/-200 kg (440 lb)). The refuel isolation valves close.

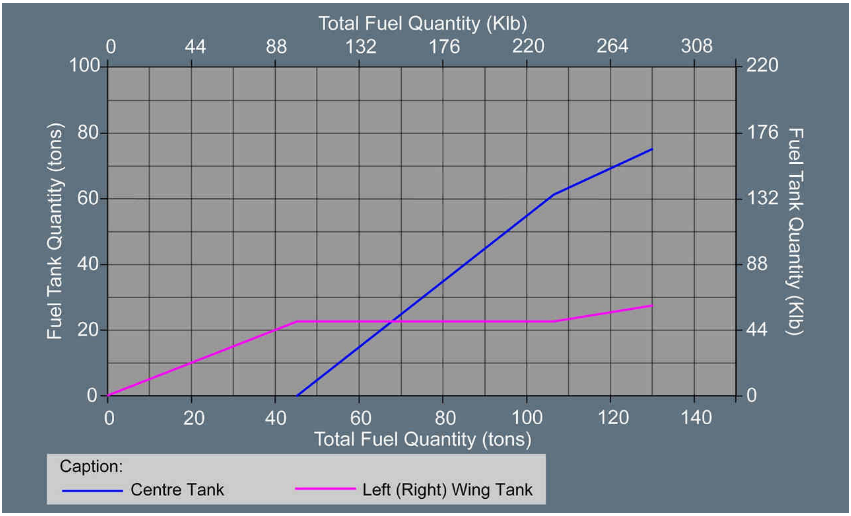
L1 Manual Refuel

The ground crew can perform manual refuel operations from the ERP.

L2 The operator manually opens and closes the refuel inlet valves as per the refuel distribution.

L1 Refuel Distribution

Fuel in the tanks is distributed as follows:



L2

Total fuel quantity (approximately)	Left and Right Wing Tanks (each approximately)	Center tank (approximately)
45 200 kg (99 650 lb)$^{(1)}$	22 600 kg (49 820 lb)	0

Continued on the following page

Continued from the previous page

106 500 kg (234 800 lb) (2)	22 600 kg (49 820 lb)	61 300 kg (135 140 lb)
110 400 kg (243 400 lb) (3)	23 400 kg (51 600 lb)	63 500 kg (140 000 lb)

(1) *This corresponds to full wing tanks, at minimum fuel density*

(2) *This corresponds to full tanks, at minimum fuel density*

(3) *This corresponds to full tanks, at fuel density 0.785 kg/l (6.551 lb/US Gal)*

L1

DEFUEL

Defueling may be necessary for maintenance reasons, or if the fuel in the aircraft is contaminated.
The ground crew can perform defuel operations via the ERP and the FQMS.
The fuel is collected through the refuel coupling(s).

Suction Defuel

Fuel pumps that are outside of the aircraft are used, usually the pumps from the bowser truck.
The operator manually controls the refuel isolation valve(s), the wing tank inlet valves and the center tank inlet valves from the ERP.

Pressure Defuel

The aircraft fuel pumps are used.
The operator manually controls the refuel isolation valve(s) and the defuel valve from the ERP.

L3 The engine feed gallery and the refuel gallery are connected.

L1

Pressure Defuel with Jettison

The aircraft fuel pumps are used.
The operator manually controls the refuel isolation valve(s), the defuel/jettison valves, and the center tank jettison valves.

L3 The engine feed gallery and the refuel gallery are connected.

OVERVIEW

Ident.: DSC-29-10-00002902.0002001 / 08 NOV 18
Applicable to: ALL

The aircraft has two identical and independent hydraulic systems, referred to as GREEN and YELLOW.

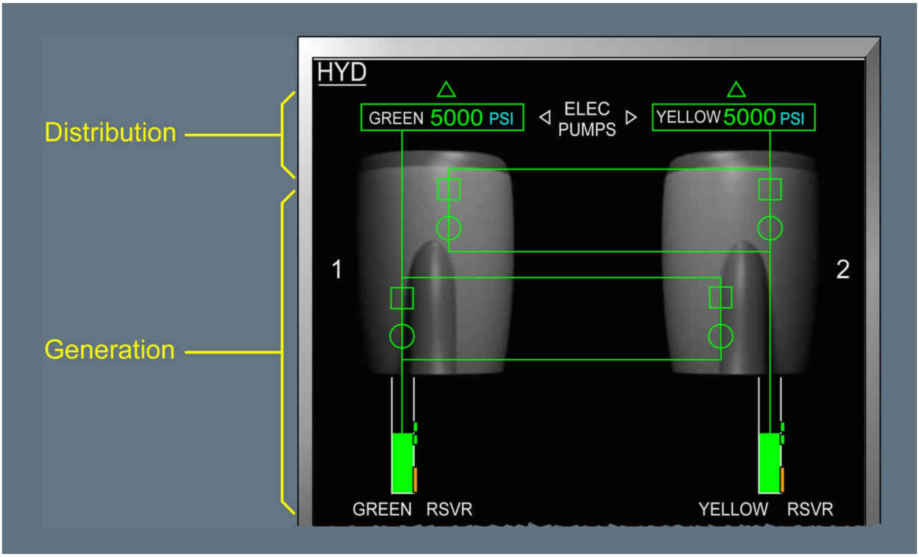
These two systems operate continuously, and power:
- The flight controls surfaces (ailerons, spoilers, elevators and rudder).
- The slats and flaps.
- Landing gears.
- Wheel brakes.
- Nose wheel steering.

L2 Hydraulic fluid cannot be transferred from one system to the other.

L1 The normal operating pressure of each hydraulic system is approximately 5 000 PSI.
Each hydraulic system is monitored and controlled by its associated Hydraulic Monitor & Control (HMC).

The hydraulic systems ensure:
- Hydraulic generation
- Hydraulic distribution.

Hydraulic system



Distribution
Generation
HYD
GREEN 5000 PSI
ELEC
PUMPS
YELLOW 5000 PSI
1
2
GREEN RSVR
YELLOW RSVR

In the case of one or both hydraulic systems fail, the following backups are available:

- For flight controls: The Electro-Hydrostatic Actuators (EHAs) and the Electrical Backup Hydraulic Actuator (EBHA).

L3 For more information on EHAs and EBHAs: *Refer to DSC-27-10-10 EHA / EBHA*.

L1
- For slats: The electric motor.

L3 For more information, *Refer to DSC-27-20-10 Slat(Flap) Systems*.

L1
- For flaps: The outer flaps.

L3 For more information, *Refer to DSC-27-20-10 Active Differential Gearbox (ADGB)*.

L1
- For braking: The braking accumulator.

L3 For more information, *Refer to DSC-32-20-10-30 Accumulator Reinflation*.

L1
- For steering: the Backup Steering Function (BSF).

L3 For more information, *Refer to DSC-32-30-40 Backup Steering Function*.

HYDRAULIC GENERATION

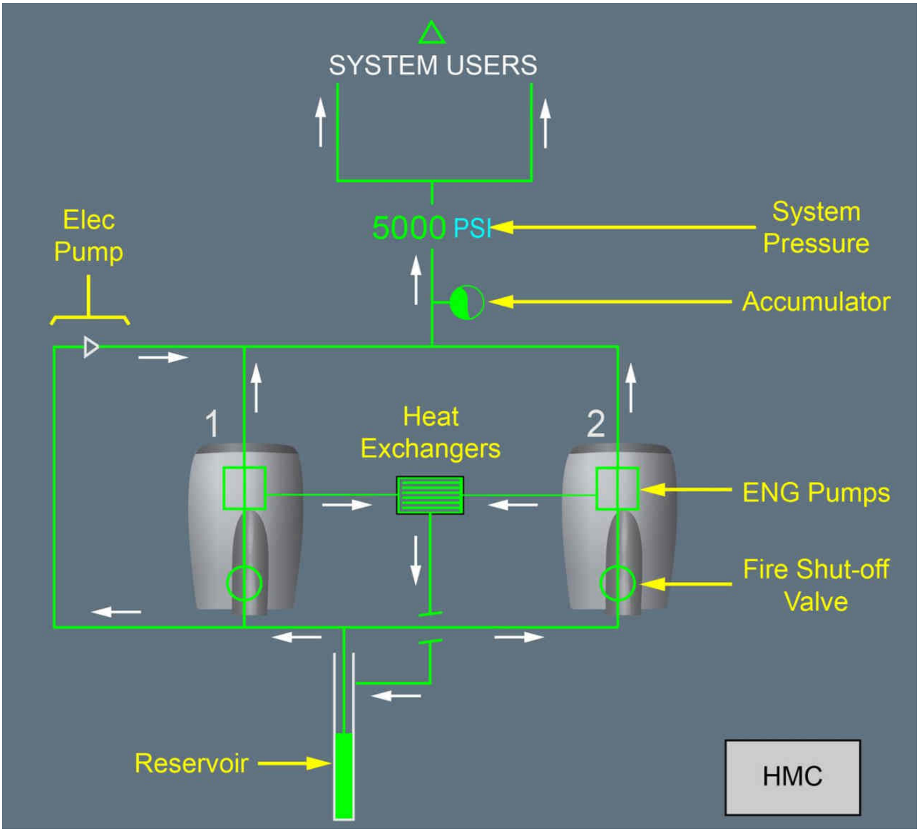
Hydraulic Generation



SYSTEM USERS
5000 PSI
System Pressure
Elec Pump
Accumulator
1
2
Heat Exchangers
ENG Pumps
Fire Shut-off Valve
Reservoir
HMC

The two hydraulic systems are identical. Therefore, only one system is illustrated and described .

Ident.: DSC-29-10-DSC2910A-00002905.0001001 / 24 APR 14
Applicable to: ALL

RESERVOIR

The reservoir provides hydraulic fluid to the system.

L3 The reservoir is self-pressurized to prevent pump cavitation, and incorporates an automatic bleed device that removes entrapped air on ground only.
The GREEN reservoir is located at the rear of the belly fairing.
The YELLOW reservoir is located inside the main landing gear bay.

Ident.: DSC-29-10-DSC2910A-00002906.0002001 / 07 NOV 19
Applicable to: ET-AWP, ET-AYA, ET-AYB

FIRE SHUT-OFF VALVE

There are two fire shutoff valves (FSOVs) per engine, one FSOV per engine driven pump. The fire shutoff valves are between the reservoir and each engine-driven pump.

The FSOVs close, when:
- The ENG FIRE pb-sw is pressed
  L3 In the case of an engine fire, closing the fire shutoff valves will isolate the affected circuit to prevent hydraulic fluid from flowing into, and sustaining, the fire.
- L1 The ENG SUPPLY pb is pressed.
  L3 In the case of hydraulic system overheat, closing the FSOV will prevent a further excessive temperature increase in the fuel heat exchanger installed in the wing fuel tank.
  The flight crew cannot open again the FSOV in flight. Maintenance action is required.

L1 The FSOVs close automatically, when:
- The EDP case drain overheat is detected.

Note: *When the EDP case drain overheat is detected, the system shuts down automatically, associated with the HYD G(Y) SYS PRESS LO ECAM alert.*

Ident.: DSC-29-10-DSC2910A-00002906.0001001 / 07 JUL 16
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO

FIRE SHUT-OFF VALVE

There are two fire shutoff valves (FSOVs) per engine, one FSOV per engine driven pump. The fire shutoff valves are between the reservoir and each engine-driven pump.

The FSOVs close, when:
- The ENG FIRE pb-sw is pressed
  L3 In the case of an engine fire, closing the fire shutoff valves will isolate the affected circuit to prevent hydraulic fluid from flowing into, and sustaining, the fire.
- L1 The ENG SUPPLY pb is pressed.
  L3 In the case of hydraulic system overheat, closing the FSOV will prevent a further excessive temperature increase in the fuel heat exchanger installed in the wing fuel tank.
  The flight crew cannot open again the FSOV in flight. Maintenance action is required.

Ident.: DSC-29-10-DSC2910A-00002907.0001001 / 24 APR 14
Applicable to: ALL

ENG PUMPS

There is one GREEN pump and one YELLOW pump per engine.

L2 If only one engine-driven pump per hydraulic system is operative:
- Flight controls hydraulic motors and spoilers remain available.
- Slats and flaps hydraulic motor remains available.
- Landing gear retraction/extension is available, but retraction time is longer than in normal operation.
- Normal braking and nose wheel steering remain available.

The GREEN and YELLOW pumps can only be disconnected via maintenance action on ground.

Ident.: DSC-29-10-DSC2910A-00002908.0001001 / 07 NOV 16
Applicable to: ALL

ELEC PUMP

There is one electric pump per hydraulic system which can provide hydraulic power only on ground, when all engines are off.

L3 The electric pump is powered with 230 V at a fixed frequency of 400 Hz. Due to the variable frequency of the engine generators, the electric pump is inhibited as soon as one engine is started.

L2
- The YELLOW electric pump operates automatically for cargo door operation or to reinflate the yellow braking accumulator when the ACCU REINFLATE pb is pressed.
- The GREEN electric pump operates automatically to reinflate the green braking accumulator, when the ACCU REINFLATE pb is pressed.

The electric pump reinflates the accumulator to ensure a sufficient pressure on braking.
For maintenance purpose or as per ECAM procedure, the electric pump can also be started manually, via the ELEC PMP AUTO pb-sw on the GND HYD panel.
When the electric pump is started manually , the GREEN or YELLOW hydraulic system power the auxiliary systems and all consumers.

L3 In the case of excessive temperature, overheat, low pressure or low level in the hydraulic system, the Hydraulic Monitoring and Control Application (HMCA) automatically stops the operation of the affected electric pump as long as the hydraulic failure is present.

Ident.: DSC-29-10-DSC2910A-00002909.0003001 / 06 NOV 19
Applicable to: ET-AWP, ET-AYA, ET-AYB

HYDRAULIC MONITORING AND CONTROL (HMC)

Each Hydraulic Monitoring and Control (HMC) monitors and controls its own hydraulic system.

L2 The HMC has two main parts:
- Hydraulic Monitoring and Control Application (HMCA): Performs main control and monitoring functions of the hydraulic system and generates most interface signals to other systems.
- Hydraulic Monitoring and Control Remote Functions (HMCRF): gathers and converts most of analog/discrete sensors signals to digital signals for a transfer to the HMCA.

L3 The HMCAs are hosted on CPIOM:
- HMCA Green 1 on CPIOM-H33
- HMCA Green 2 on CPIOM-H34
- HMCA Yellow 1 on CPIOM-H31
- HMCA Yellow 2 on CPIOM-H32.

The HMCRFs are hosted on CRDC:
- HMCRF Green 1 on CRDC-B11
- HMCRF Green 2 on CRDC-B12
- HMCRF Green 3 on CRDC-B13
- HMCRF Yellow 1 on CRDC-B03
- HMCRF Yellow 2 on CRDC-B04
- HMCRF Yellow 3 on CRDC-B08
- HMCRF Yellow 4 on CRDC-B02
- HMCRF Yellow 5 on CRDC-B12.

The HMCA monitors the:
- EDP status, pressure and the case drain temperature
- Electric pump status and pressure
- System pressure
- Reservoir pressure, level and temperature
- Filter status
- Cockpit pushbutton status

The HMCA controls the:
- EDP depressurization function
- EDP auto depressurization function when fuel level is low or when temp high is detected
- Electric Pump status
- Uncontained Engine Rotor Failure UERF detection
- FSOV
- Hydraulic overhead panel lights

Ident.: DSC-29-10-DSC2910A-00002909.0002001 / 28 MAR 17

HYDRAULIC MONITORING AND CONTROL (HMC)

Each Hydraulic Monitoring and Control (HMC) monitors and controls its own hydraulic system.

L2 The HMC has two main parts:
- Hydraulic Monitoring and Control Application (HMCA): Performs main control and monitoring functions of the hydraulic system and generates most interface signals to other systems.
- Hydraulic Monitoring and Control Remote Functions (HMCRF): gathers and converts most of analog/discrete sensors signals to digital signals for a transfer to the HMCA.

L3 The HMCAs are hosted on CPIOM:
- HMCA Green 1 on CPIOM-H33
- HMCA Green 2 on CPIOM-H34
- HMCA Yellow 1 on CPIOM-H31
- HMCA Yellow 2 on CPIOM-H32.

The HMCRFs are hosted on CRDC:
- HMCRF Green 1 on CRDC-B11
- HMCRF Green 2 on CRDC-B12
- HMCRF Green 3 on CRDC-B13
- HMCRF Yellow 1 on CRDC-B03
- HMCRF Yellow 2 on CRDC-B04
- HMCRF Yellow 3 on CRDC-B08
- HMCRF Yellow 4 on CRDC-B02
- HMCRF Yellow 5 on CRDC-B12.

The HMCA monitors the:
- EDP status, pressure and the case drain temperature
- Electric pump status and pressure
- System pressure
- Reservoir pressure, level and temperature
- Filter status
- Cockpit pushbutton status

The HMCA controls the:
- EDP depressurization function
- EDP auto depressurization function at low fuel level
- Electric Pump status
- Uncontained Engine Rotor Failure UERF detection
- FSOV
- Hydraulic overhead panel lights

HYDRAULIC MONITORING AND CONTROL (HMC)

Each Hydraulic Monitoring and Control (HMC) monitors and controls its own hydraulic system.

L2 The HMC has two main parts:
- Hydraulic Monitoring and Control Application (HMCA): Performs main control and monitoring functions of the hydraulic system and generates most interface signals to other systems.
- Hydraulic Monitoring and Control Remote Functions (HMCRF): gathers and converts most of analog/discrete sensors signals to digital signals for a transfer to the HMCA.

L3 The HMCAs are hosted on CPIOM:
- HMCA Green 1 on CPIOM-H33
- HMCA Green 2 on CPIOM-H34
- HMCA Yellow 1 on CPIOM-H31
- HMCA Yellow 2 on CPIOM-H32.

The HMCRFs are hosted on CRDC:
- HMCRF Green 1 on CRDC-B11
- HMCRF Green 2 on CRDC-B12
- HMCRF Green 3 on CRDC-B13
- HMCRF Yellow 1 on CRDC-B03
- HMCRF Yellow 2 on CRDC-B04.
- HMCRF Yellow 3 on CRDC-B08

The HMCA monitors the:
- EDP status, pressure and the case drain temperature
- Electric pump status and pressure
- System pressure
- Reservoir pressure, level and temperature
- Filter status
- Cockpit pushbutton status

The HMCA controls the:
- EDP depressurization function
- EDP auto depressurization function at low fuel level
- Electric Pump status
- Uncontained Engine Rotor Failure UERF detection
- FSOV
- Hydraulic overhead panel lights

Applicable to: ALL

HYDRAULIC HEAT EXCHANGERS

Each hydraulic system has its own cooling system, that prevents the overheat and thermal degradation of hydraulic fluid.
Each hydraulic system has one hydraulic heat exchanger in each wing fuel tank.
L3 The temperature of the fluid is controlled by a temperature control valve inside the case-drain filter manifold.

When the fluid temperature is:
- Below 60 °C: The thermal valve bypasses the Hydraulic Heat Exchanger (HHX).
- Between 60 °C and 80 °C: The thermal valve progressively closes and the flow is partially routed through the HHX
- Above 80 °C: The thermal valve closes and the flow is fully routed through the HHX.

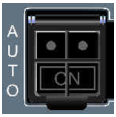
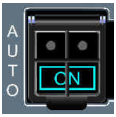
GREEN(YELLOW) ELEC PMP AUTO PB



The electric pump is not running.

L12



The electric pump is running, and has either been automatically-controlled or manually-selected.
The electric pump can be manually set to ON, but it is not operationally recommended except when required by ECAM procedure.

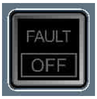
Note: *Associated with the following ECAM alert: HYD G(Y) RSVR PRESS LO (Refer to procedure).*
- *When the electric pump operates in automatic mode, any action on the ELEC PMP AUTO pb is disregarded*
- *When the electric pump operates in manual mode, the automatic mode is disregarded.*

CAUTION	When the pump is manually-selected, the hydraulic system is fully pressurized. Do not pressurize the hydraulic system without clearance from the ground crew.

Ident.: DSC-29-20-DSC2920B-00002922.0002001 / 06 NOV 19
Applicable to: ET-AWP, ET-AYA, ET-AYB

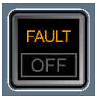
GREEN(YELLOW) ELEC PMP PB-SW

The electric pump is fully automatic and does not require any crew action, unless requested by the ECAM.



The HMC automatically controls the electric pump.

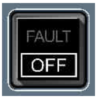
L12



The pump is failed, or the pump must be stopped because of a hydraulic system failure.

Associated with one of the following ECAM alerts:
- HYD G(Y) ELEC PMP FAULT (*Refer to procedure*).
- HYD G(Y) RSVR TEMP HI (*Refer to procedure*).
- HYD G(Y) RSVR OVHT (*Refer to procedure*).
- HYD G(Y) RSVR LEVEL LO (*Refer to procedure*).

The FAULT light goes off, when the flight crew sets the ELEC PMP pb-sw to OFF. However, in the case of an overheat, the FAULT light will remain on, until the fluid high temperature disappears.



The pump is OFF and inhibited. Neither the flight crew nor the HMC can start the pump.

EDP

The EDP is on, and the hydraulic pressure is normal.

L12

The EDP is automatically depressurized due to a fuel low level in a wing tank. The automatic depressurization can occur in the case of fuel low level in a wing fuel tank and if the temperature of one hydraulic RSVR is above 80 °C, one EDP per hydraulic system (GREEN and YELLOW) is automatically depressurized to minimize heat rejection into the hydraulic system. However before landing or in the case of high hydraulic consumers demand, the depressurized EDP is automatically running.

L12

The EDP is manually depressurized and ENG 1(2) PUMP pb-sw is OFF or is automatically depressurized due to high temperature.
When an abnormal temperature is detected in one EDP, the ECAM alert HYD ENG 1(2) G(Y) PMP FAULT is triggered and the EDP is automatically depressurized until the end of the flight. For more information about the temperature threshold, *Refer to DSC-29-30 Excessive Temperature in the Hydraulic System*.

Associated with one of the following ECAM alert:
- HYD G+Y SYS PRESS LO (*Refer to procedure*).
- HYD ENG 1(2) G(Y) PMP PRESS LO (*Refer to procedure*).
- HYD ENG 1(2) G(Y) PMP FAULT (*Refer to procedure*).
- HYD G(Y) RSVR OVHT (*Refer to procedure*).
- HYD G(Y) RSVR TEMP HI (*Refer to procedure*).
- HYD G(Y) RSVR LEVEL LO (*Refer to procedure*).

The EDP is set to OFF but remains abnormally pressurized.

L12

- The EDP is running, and a low hydraulic pressure is detected.
  Associated with the following ECAM alert: HYD ENG 1(2) G(Y) PMP PRESS LO (*Refer to procedure*).
- On ground, the associated engine is not running.

The pump is manually disconnected from the engine accessory gearbox, via the mechanical declutch mechanism.

L12

The EDP is running, and a high hydraulic pressure is detected.
Associated with the following ECAM alert: HYD ENG 1(2) G(Y) PMP FAULT (*Refer to procedure*).

EXCESSIVE TEMPERATURE IN THE HYDRAULIC SYSTEM

Ident.: DSC-29-30-00023693.0003001 / 03 JUL 20
Applicable to: ET-AWP, ET-AYA, ET-AYB

The hydraulic system monitors the temperature in the EDP and in the reservoir.

Note: *The case drain temperature in the EDP is monitored by two temperature transducer in each case drain filter manifold and the reservoir temperature is monitored by two temperature transducers in each reservoir.*

EDP

When the hydraulic system detects an abnormal temperature in the EDP, one of the following ECAM alert is triggered:

- HYD ENG 1(2) G(Y) PMP FAULT along with a DUE TO PMP TEMP HI subtitle, or
  L2 For more information, *Refer to procedure*.
- L1 HYD ENG 1(2) G(Y) PMP FAULT along with a DUE TO PMP OVHT subtitle.
  L2 For more information, *Refer to procedure*.

L1 When the abnormal temperature is detected, the TEMP HI or OVHT indication and the associated EDP temperature value is displayed on the HYD SD page in accordance with the ECAM alert.
When the ECAM alert along with a DUE TO PMP TEMP HI subtitle is triggered, the affected EDP is automatically depressurized until the end of the flight.
When the ECAM alert along with a DUE TO PMP OVHT subtitle is triggered, the associated FSOV automatically isolates the affected EDP until the end of the flight.

L2

Fuel condition	EDP TEMP		
	T > 120 °C	T > 135 °C	T > 145 °C
Nominal	HYD ENG 1(2) G(Y) PMP FAULT [DUE TO PMP TEMP HI]	-	HYD ENG 1(2) G(Y) PMP FAULT [DUE TO PMP OVHT]
Fuel low level	-	HYD ENG 1(2) G(Y) PMP FAULT [DUE TO PMP TEMP HI]	

1 L1 RSVR

When the hydraulic system detects an abnormal temperature in the reservoir, one of the following ECAM alert is triggered:

- HYD G(Y) RSVR TEMP HI, or
  L2 For more information, *Refer to procedure*.
- L1 HYD G(Y) RSVR OVHT.
  L2 For more information, *Refer to procedure*.

L1 When the abnormal temperature is detected, the TEMP HI or OVHT indication and the associated RSVR temperature value is displayed on the HYD SD page in accordance with the ECAM alert.
When the ECAM alert HYD G(Y) RSVR TEMP HI is triggered, both EDPs are manually depressurized in accordance with ECAM.
When the ECAM alert HYD G(Y) RSVR OVHT is triggered, the isolation of the affected EDP is performed by closing the FSOV via the red guarded OVHT ISOL pb and will stay in closed position until the end of the flight.

L2

Fuel condition	RSVR TEMP		
	T > 95 °C	T > 115 °C	T > 120 °C
Nominal	HYD G(Y) RSVR TEMP HI	-	HYD G(Y) RSVR OVHT
Fuel low level	-	HYD G(Y) RSVR TEMP HI	

EXCESSIVE TEMPERATURE IN THE HYDRAULIC SYSTEM

Ident.: DSC-29-30-00023693.0002001 / 07 MAY 18
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO

The hydraulic system monitors the temperature in the reservoir and in the EDP.

When the hydraulic system detects an abnormal temperature one of the following ECAM alert is triggered:

- HYD G(Y) SYS TEMP HI, or
L2 For more information, *Refer to procedure*.
L1 - HYD G(Y) SYS OVHT.
L2 For more information, *Refer to procedure*.

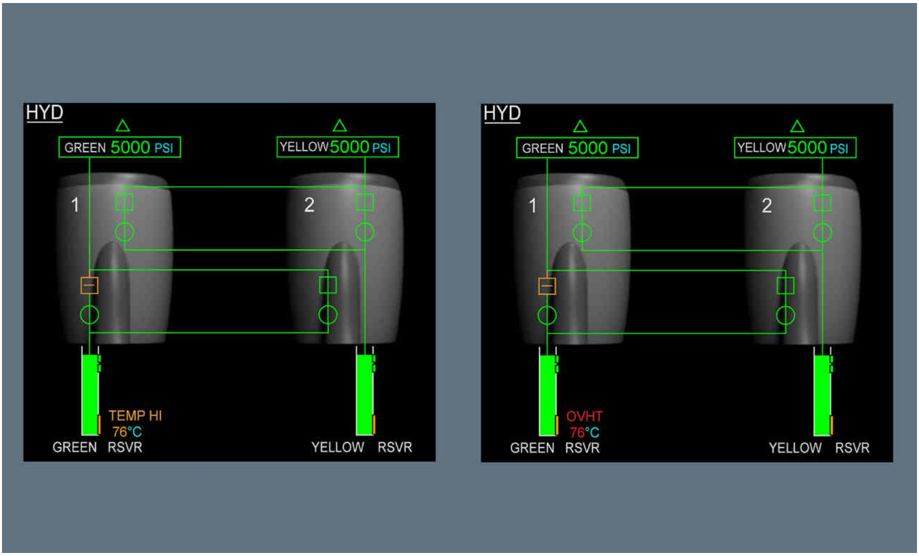
Depending on the temperature detected in the reservoir or in the EDP, the following table indicates the triggered ECAM alert.

RSVR TEMP	EDP TEMP		
	T < 120 °C	120 °C < T < 145 °C	T > 145 °C
T < 95 °C	-	HYD G(Y) SYS TEMP HI	HYD G(Y) SYS OVHT
95 °C < T < 120 °C	HYD G(Y) SYS TEMP HI	HYD G(Y) SYS TEMP HI	HYD G(Y) SYS OVHT
T > 120 °C	HYD G(Y) SYS OVHT		

L3 In the case of low fuel level, the performance of the hydraulic heat exchanger is low and the following table applies.

RSVR TEMP	EDP TEMP		
	T < 135 °C	135 °C < T < 145 °C	T > 145 °C
T < 115 °C	-	HYD G(Y) SYS TEMP HI	HYD G(Y) SYS OVHT
115 °C < T < 120 °C	HYD G(Y) SYS TEMP HI	HYD G(Y) SYS TEMP HI	HYD G(Y) SYS OVHT
T > 120 °C	HYD G(Y) SYS OVHT		

L1 When the abnormal temperature is detected, the TEMP HI or OVHT indication and the associated RSVR temperature are displayed on the HYD SD page in accordance with the ECAM alert.
If the abnormal temperature is detected only in the EDP, the RSVR temperature displayed on the HYD SD page may be below 95 °C and the affected EDP is automatically depressurized until the end of the flight.



HYD
GREEN 5000 PSI
YELLOW 5000 PSI

L1 After an automatic depressurization due to an abnormal temperature:

- The recovery of the affected EDP is not possible during the flight, and
- The following ECAM alert is displayed: HYD G(Y) SYS MONITORING FAULT (*Refer to procedure*).

DISCREPANCY BETWEEN WHEEL SD page AND ECAM ALERTS IN THE CASE OF HYDRAULIC FAILURE - NORM INDICATION

Ident.: DSC-29-40-00022167.0001001 / 12 NOV 14
Applicable to: ALL

DESCRIPTION

When HYD G(Y) SYS PRESS LO alert is triggered after landing gear extension, on the WHEEL SD page, NORM indication may be displayed instead of NORM.
However, the HYD G(Y) SYS PRESS LO alert is correct on the WD and PART NORM BRK correctly displayed in the INOP SYS section of the SD STATUS page.

PROCEDURE

If the HYD G(Y) SYS PRESS LO alert is triggered after landing gear extension.
On the WHEEL SD page:Disregard NORM indication.

OVERVIEW

Ident.: DSC-30-20-10-00002949.0001001 / 30 APR 14
Applicable to: ALL

The ice protection system protects the critical areas of the aircraft against ice in order to enable unrestricted operation of the aircraft in icing conditions.

For that purpose, the ice protection system uses:
- Hot bleed air for:
  - Engine anti-ice
  - Wing anti-ice.
- Electrical power for:
  - Window heating
  - Water/Waste drain masts heating
  - Probe heating.

An ice detection system detects when the aircraft is flying in icing conditions and provides this information to the flight crew.

ICE DETECTION

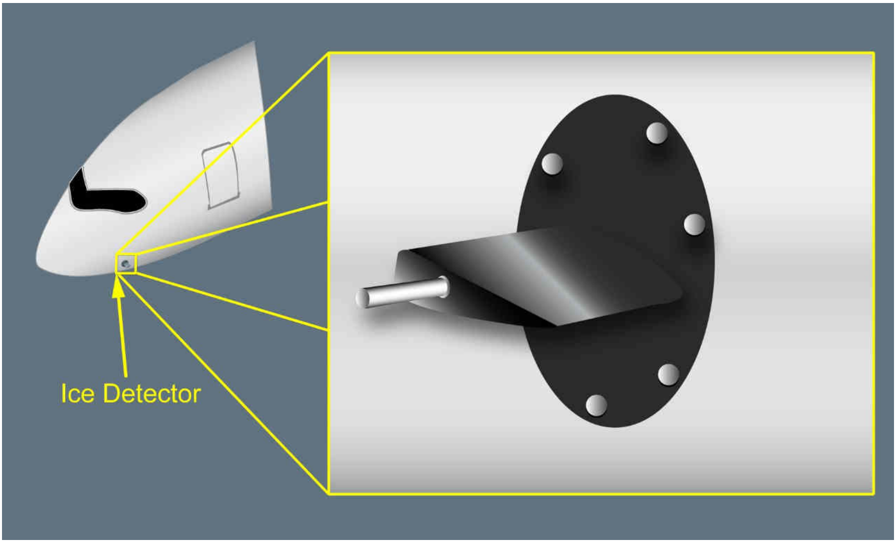
Applicable to: ALL

Ident.: DSC-30-20-10-10-00002951.0001001 / 30 APR 14

ICE DETECTION SYSTEM

The ice detection system has two ice detectors that measure ice accretion. If there is icing, or severe icing conditions, the ice detectors provide this information to the flight crew.
There is one ice detector on each side of the fuselage, on the lower part of the nose fuselage.

Ice detectors



L3 Each ice detector has a probe that measures icing.

L1 - If at least one ice detector detects icing conditions, and if engine anti-ice is off: The ECAM triggers the A-ICE ICE DETECTED alert.

L3 If 0.5 mm of ice builds up on any probe, the ice detection system informs the anti-ice control system of icing conditions.
An internal heating device deices the probes, to permit subsequent ice detection.

L1 - If at least one ice detector subsequently detects severe icing conditions, and if wing anti-ice is off: The ECAM triggers the A-ICE SEVERE ICE DETECTED alert.

L3 If 0.5 mm of ice builds up 7 times on the same probe, the ice detection system informs the anti-ice control system of severe icing conditions. This number of ice detections corresponds to approximately 5 mm of ice accretion on the airframe. The ice detection counter resets to zero, when wing anti-ice is on.

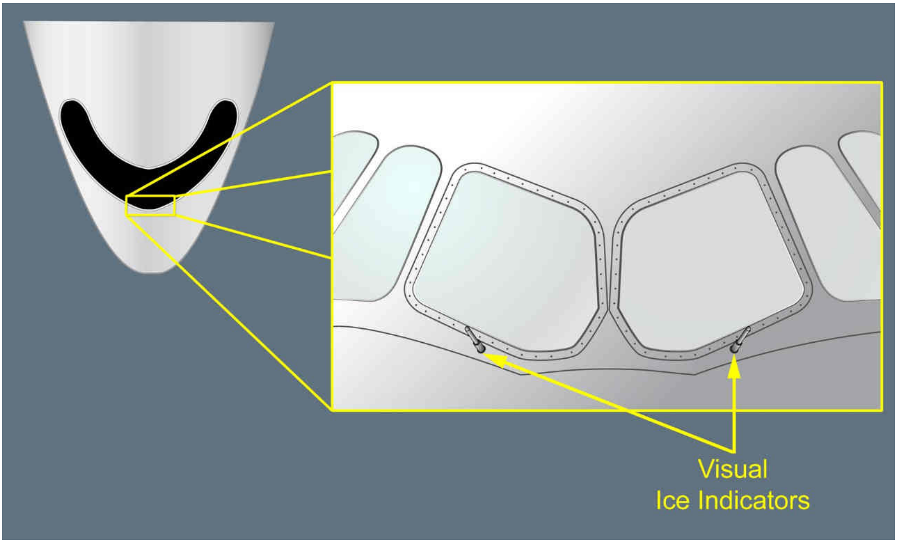
L1 - If icing is not detected for approximately 2 min, and if wing anti-ice and/or engine anti-ice are on: The ECAM displays the ICE NOT DETECTED memo.

Ident.: DSC-30-20-10-10-00002953.0001001 / 30 APR 14

VISUAL ICE INDICATORS

There are two visual ice indicators outside the aircraft, on the lower part of the two windshield frames. They provide the flight crew with evidence of ice accretion.
The visual ice indicators can be illuminated.

Visual Ice Detectors



ENGINE ANTI-ICE

Ident.: DSC-30-20-10-00002952.0001001 / 30 APR 14
Applicable to: ALL

Each engine has its own anti-ice system, with an independent hot bleed air source.

L3 This bleed air comes from the 3rd stage of the High Pressure Compressor to anti-ice the engine air inlet.

L1 Two anti-ice valves on each engine enable the flow of hot air.

L2
- The pressure regulating shutoff valve is closed when the engine anti-ice is off
- The pressure regulating valve regulates the air pressure to the engine air inlet.
  In the case the pressure regulating valve fails in open position, the pressure regulating shutoff valve can regulate the air pressure as a backup regulation means.

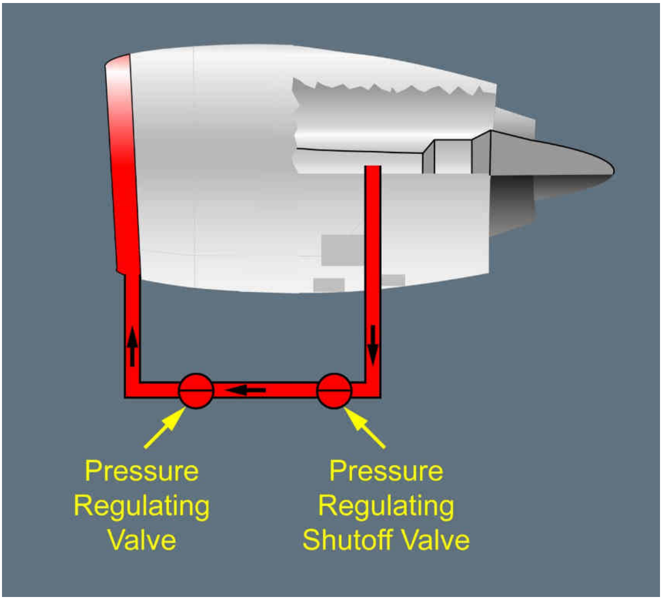
For each engine, two Anti-Ice Control Functions (AICFs) control and monitor the anti-ice valves of the associated engine.

L3 AICF 1 in CPIOM J21 and AICF 3 in CPIOM J23 control and monitor the anti-ice valves of the engine 1.

AICF 2 in CPIOM J22 and AICF 4 in CPIOM J24 control and monitor the anti-ice valves of the engine 2.

Each valve is electrically-controlled and pneumatically-actuated. The valve opens, if it loses its power supply.

Engine anti-ice



L1 When the flight crew sets the applicable ENG ANTI ICE pb to ON, the engine anti-ice valves of the selected engine open.

WING ANTI-ICE

Ident.: DSC-30-20-10-00002954.0001001 / 04 DEC 14
Applicable to: ALL

Hot air from the pneumatic system can be used to prevent ice accretion on slats 3, 4 and 5.
In each wing, a wing anti-ice valve enables the flow of hot air.

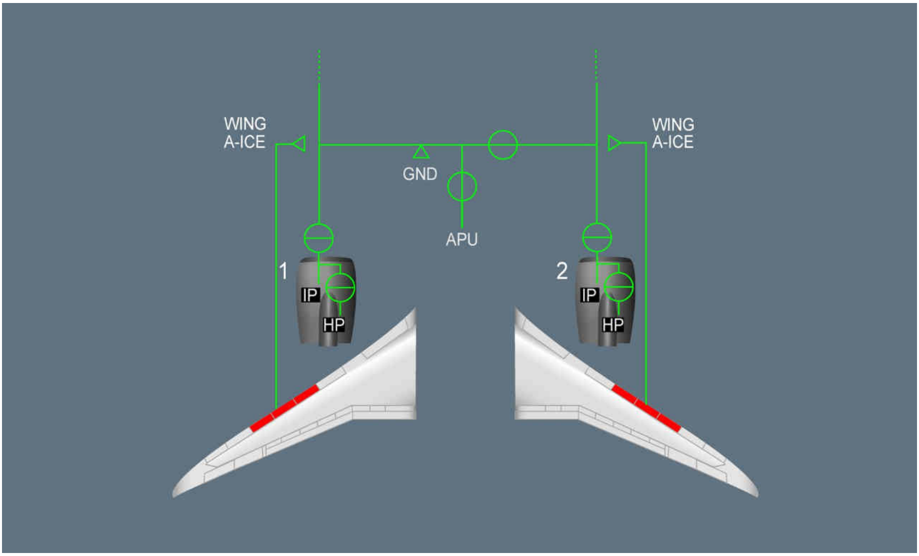
L2 The wing anti-ice system has:
- Two control channels
- Two monitoring channels.

Only one monitoring channel and one control channel is active at a time. The other channel becomes active when the first one fails.

L3 Each control channel has:
- One Wing Ice Protection System (WIPS) application in CPIOM H43 (resp. H44)
- One CRDC.

Each monitoring channel has:
- One Bleed and Overheat Monitoring Unit (BOMU)
- One CRDC.

Wing Anti-Ice



L1 When the flight crew sets the WING ANTI ICE pb to ON, both wing anti-ice valves open.

L2 The wing anti-ice valves automatically close if the SAT is above 30 °C (86 °F).

L1 On ground, when the WING ANTI ICE pb is set to ON, the wing anti-ice valves will open for approximately 20 s (provided that bleed air is available from the engines, the APU or HP ground sources) and then will close. During takeoff, the wing anti-ice valves will then automatically open when the landing gear is no more compressed.

L3 Each valve is electrically-controlled and pneumatically-actuated. The valve closes, if it loses its power supply.

WATER/WASTE ANTI-ICE

Ident.: DSC-30-20-10-00002955.0001001 / 30 APR 14
Applicable to: ALL

The water lines are automatically heated to prevent ice formation, which could lead to damage and/or obstruction of the water lines.

L3 Water lines heating is monitored and controlled by three Ice Protection Control Units (IPCU).

The following areas are heated:
- The drain masts
- The sections of the water/waste lines coming from the galleys and lavatory washbasins, which are located below the cargo compartment floor
- The drain tubes of the waste tanks
- The water servicing panel
- The potable water lines, located close to the potable water tanks, close to the forward drain panel, and inside the wing center section.

Sensors measure the temperature in these areas. For each area, the IPCUs compare the temperature to a reference temperature. When the actual temperature is below the reference temperature, the IPCUs activate the heating in the affected area.

COCKPIT WINDOW HEATING

Ident.: DSC-30-20-10-00002956.0001001 / 30 APR 14
Applicable to: ALL

The cockpit windows (windshield and side windows) are electrically-heated.

L2 The windshields are heated to prevent icing and to defog.
The side windows are heated to defog only.

L1 The heating system is fully automatic, and operates as soon as any engine is started.
However, before engine start, the crew can manually activate the system, via the PROBE & WINDOW HEAT pb-sw.

L2 On each side, a windows heating system monitors and controls the heating of the associated windshield and windows.

L3 Each windows heating system:
- Regulate the cockpit window temperature on its associated side,
- Operate the windshield and side windows heating at normal power, on ground and in flight, on its associated side.

PROBE HEATING

Ident.: DSC-30-20-10-00002957.0002001 / 07 JUN 19
Applicable to: ALL

The MFPs, the static probes, and the fourth AOA probe are automatically heated to prevent ice formation. The pitot probe and the static probes of the ISIS are also automatically heated.
The probe heating system is fully automatic, and operates as soon as any engine is started.
However, before engine start, the flight crew can manually activate the system, via the PROBE & WINDOW HEAT pb-sw.

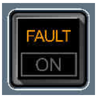
Ident.: DSC-30-20-20-10-00002963.0002001 / 07 JUL 16

ENG 1(2) ANTI ICE PB

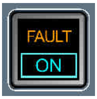
	The anti-ice of the applicable engine is off.
	The anti-ice of the applicable engine is on. The ECAM displays the ENG 1(2)(1+2) A-ICE memo.

L12



The shutoff valve of the engine anti-ice system is abnormally open on the applicable engine.
Associated with the following ECAM alert: A-ICE ENG 1(2) VLV OPEN (*Refer to procedure*)

L12

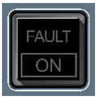


One of the following applies:

- The shutoff valve or the pressure regulating valve of the engine anti-ice system is abnormally closed on the applicable engine
  Associated with the following ECAM alert: A-ICE ENG 1(2) VLV CLOSED (*Refer to procedure*)
- The engine anti-ice system is failed on the applicable engine.

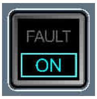
Ident.: DSC-30-20-20-10-00002964.0001001 / 04 DEC 14

WING ANTI ICE PB



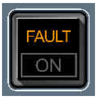
Wing anti-ice is off.

L12



Wing anti-ice is on.
The ECAM displays the WING A-ICE memo.
On ground, the wing anti-ice valves open for approximately 20 s. The valves will then close. If the flight crew does not switch off the wing anti-ice, the ON light will remain on, even though the wing anti-ice valves are closed. The wing anti-ice valves will then reopen during takeoff when the landing gear is no more compressed.

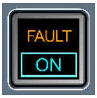
L12



One of the following applies:

- The left or right wing anti-ice valve is abnormally open
  Associated with the following ECAM alert: A-ICE L(R) WING VLV OPEN (*Refer to procedure*)
- The control and the monitoring channels of the wing anti-ice control system are not synchronized
  Associated with the following ECAM alert: A-ICE WING SYS FAULT (*Refer to procedure*)
- A leak is detected in the left or right wing anti-ice bleed duct.
  Associated with the following ECAM alert: AIR L(R) WING A-ICE LEAK (*Refer to procedure*)

L12



One of the following applies:

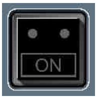
- The left or right wing anti-ice valve is abnormally closed
  Associated with the following ECAM alert: A-ICE L(R) WING VLV CLOSED (*Refer to procedure*)
- The wing anti-ice valves are open, but an abnormal pressure is detected

  Associated with one of the following the following ECAM alerts:
  - A-ICE L(R) WING VLV PRESS LO (*Refer to procedure*)
  - A-ICE L(R) WING VLV PRESS HI (*Refer to procedure*)
- The wing anti-ice control system is faulty.
  Associated with the following ECAM alert: A-ICE WING SYS FAULT (*Refer to procedure*)

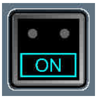
The FAULT light goes off, when the affected wing anti-ice system is recovered, after applying the procedure. If the system cannot be recovered, the FAULT light will remain on for the remainder of the flight.

Ident.: DSC-30-20-20-10-00002960.0001001 / 30 APR 14

PROBE & WINDOW HEAT PB-SW



Probe and window heating is automatic, and will operate as soon as any engine is started.



Probe and window heating is selected on.

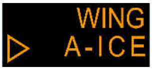
WING A-ICE INDICATION

	When there is no display, the wing anti-ice is off.
	Wing anti-ice is on and is operating.

Wing anti-ice is commanded on but the associated valve remains normally closed.

L12



One of the following applies:
- Wing anti-ice is commanded off but remains on
  Associated with the following ECAM alert: A-ICE L(R) WING VLV OPEN (*Refer to procedure*)
- Wing anti-ice is commanded on but the associated valve remains abnormally closed
  Associated with the following ECAM alert: A-ICE L(R) WING VLV CLOSED (*Refer to procedure*)
- An abnormal pressure is detected.

  Associated with one of the following ECAM alerts:
  - A-ICE L(R) WING VLV PRESS HI (*Refer to procedure*)
  - A-ICE L(R) WING VLV PRESS LO (*Refer to procedure*)

OVERVIEW

Ident.: DSC-30-30-10-00011293.0001001 / 26 JUL 17
Applicable to: ALL

The rain removal system has:
- Two wipers
- A rain repellent system ◁ .

WIPERS

Ident.: DSC-30-30-10-00002988.0001001 / 30 APR 14
Applicable to: ALL

The Captain and First Officer windshields each has a five-speed electric wiper, including three intermittent speed settings.
Each windshield wiper is controlled by its assigned WIPER selector.

L2 The heating system of the cockpit windows does not cover the surface where the wipers are stored (central frame between the windshields). Therefore, the use of the window heating system will not unfreeze the wipers if they are blocked by ice. Manual deicing is required in this case.

L3 The vertical storage of the wipers (when they are not in use) prevents vibration and noise that could be generated by the wiper blades.

RAIN REPELLENT ◁

Ident.: DSC-30-30-10-00002989.0001001 / 26 JUL 17
Applicable to: ALL

The rain repellent improves visibility in heavy rain conditions. This is done by spraying rain repellent fluid on the surface of the windshield.

L3 When sprayed on the windshield, rain repellent fluid increases the surface tension of the water. This removes the film of water from the windshield, and improves visibility. Only water droplets remain. However, these droplets easily dissipate with airspeed.

L1 A RAIN RPLNT pb, on the left and on the right sides of the overhead panel, controls the application of repellent fluid on the respective Captain or First Officer's windshield.

L2 The rain repellent system is operative, when the engines are running.

WIPER SELECTOR

Each windshield wiper is controlled by its own WIPER selector, that has a SLOW and FAST speed setting, and three intermittent speed settings.
The wipers should not be used when the speed is more than 230 kt.

L2 If a wiper is blocked when commanded on, the wiper actuator command is stopped, in order to preserve the wiper motor. The normal use of the wiper is recovered by switching the WIPER selector off then on again when the wiper is unblocked.

Ident.: DSC-30-30-20-10-00002994.0001001 / 26 JUL 17

RAIN RPLNT PB ◁

A RAIN RPLNT pb, on the left and on the right sides of the overhead panel, controls the application of repellent fluid on the respective Captain or First Officer's windshield.
Pressing the RAIN RPLNT pb applies some repellent fluid on the windshield. More fluid can be added, by releasing the pushbutton, and pressing it again.

OVERVIEW

Ident.: DSC-31-CDS-10-00000078.0001001 / 10 MAY 19
Applicable to: ALL

The Control and Display System (CDS) provides the flight crew with the information necessary to safely and accurately operate the aircraft.
The CDS has 6 identical and interchangeable Display Units (DUs).
L2 For more information, *Refer to DSC-31-CDS-30-10 Display Units*

L1 The CDS enables the flight crew to perform all of the following:
- Fly and navigate the aircraft, via all of the following:
  - The Electronic Flight Instrument System (EFIS)
  - The Head Up Display (HUD) ◁
  - The Multifunction Display (MFD)
  - The Integrated Standby Instrument System (ISIS)
  - The Radio Management Panel (RMP).
- Communicate, via both of the following:
  - The Radio Management Panel, for voice and datalink communication.
    L2 For more information, *Refer to DSC-23-10-10 Introduction*
  - L1 The MFD and the Mailbox, for datalink communication.
- Manage the aircraft systems, via:
  - The Electronic Centralized Aircraft Monitoring (ECAM).
- Manage the mission, via both of the following:
  - The MFD
  - The Onboard Information System (OIS).

ISIS
MFD
OIS Keyboard
KCCU
KCCU
ECP

EFIS

The EFIS displays flight parameters and navigation data on both of the following displays:
- The Primary Flight Display (PFD), for short-term flight information
- The Navigation Display (ND), for medium and long-term flight information.

L2 For more information, *Refer to DSC-31-CDS-40-10 Overview*.

L1 HUD

The HUD displays flight parameters and guidance information in the flight crew's field of vision.

MFD

The MFD provides an interface with all of the following systems:
- The FMS, *Refer to DSC-22-FMS-10-10 Overview*
- The ATC Datalink System, *Refer to DSC-46-ATC-20-20 MFD Overview*
- The SURV, *Refer to DSC-34-SURV-10 Overview*
- The ECAM NORM C/L, *Refer to DSC-31-CDS-60-10-30 MFD Overview*
- The FCU Backup function for the AFS, *Refer to DSC-31-CDS-40-60 MFD - FCU BKUP Pages*.

L2 For more information, *Refer to DSC-31-CDS-70-10 MFD*.

ISIS

The ISIS provides a backup of flight parameters and navigation data in the case of loss of EFIS.
For more information, *Refer to DSC-34-NAV-30-10 Overview*.

ECAM

The ECAM enables the flight crew to monitor and manage aircraft systems during normal and abnormal operations.
For more information, *Refer to DSC-31-CDS-60-10-00 General*.

OIS

The OIS provides the flight crew with operating manuals, performance computation, and mission management information.
For more information, *Refer to DSC-31-CDS-80 OIS*.

MAILBOX

The mailbox enables the flight crew to establish a datalink communication with the active ATC Center.
For more information, *Refer to DSC-31-CDS-90-10 Mailbox*.

VIDEO

The CDS can display all of the following video sources:

- The External and Taxiing Aid Camera System (ETACS) ◁✳
  For more information, *Refer to DSC-31-CDS-110-10 Overview*
- The Airport Navigation Function (ANF)
  For more information, *Refer to DSC-34-NAV-80-10 General*
- The Cockpit Door Surveillance System (CDSS) ◁✳
  For more information, *Refer to DSC-31-CDS-110-10 Overview*
- The Cabin Video Monitoring System (CVMS) ◁✳
  For more information, *Refer to DSC-31-CDS-110-10 Overview*
- The Lower Deck Surveillance Function ◁✳ .
  For more information, *Refer to DSC-31-CDS-110-10 Overview*.

CONTROLS

In order to interact with the various displays and functions, the flight crew uses all of the following:

- An EFIS Control Panel (EFIS CP), *Refer to DSC-31-CDS-110-20 EFIS CP*
- An HUD Control Panel ◁✳
- An ECAM Control Panel (ECP), *Refer to DSC-31-CDS-60-20 ECP*
- A Keyboard and Cursor Control Unit (KCCU), *Refer to DSC-31-CDS-100-10 General*

- An OIS Keyboard and pointing device, *Refer to DSC-46-OIS-20-100 Overview*
- Both of the following DUs controls:
    - Brightness, Contrast, Reset, *Refer to DU Controls*
    - DU Master Brightness knob, *Refer to DU MASTER BRT knob*.

ARCHITECTURE

Applicable to: ALL

Ident.: DSC-31-CDS-20-10-00000083.0001001 / 04 MAY 16

Each DU is able to process all the available functions and displays:
- EFIS
- ECAM
- MFD
- OIS
- Mailbox
- Videos

L3 Each DU can receive and display:
- Aircraft parameters, via the avionics network
- Essential parameters, via a backup connection instead of the avionics network, if the avionics network is lost
- Video images, from the 2 Concentrators and Multiplexer for Videos (CMV), via fiber optic connection
- The CDS internal network, to enable interactivity between the DUs and the various controls (KCCUs, OIS Keyboards etc...).

DISPLAY UNITS

Ident.: DSC-31-CDS-30-10-00000086.0001001 / 10 MAY 19
Applicable to: ALL

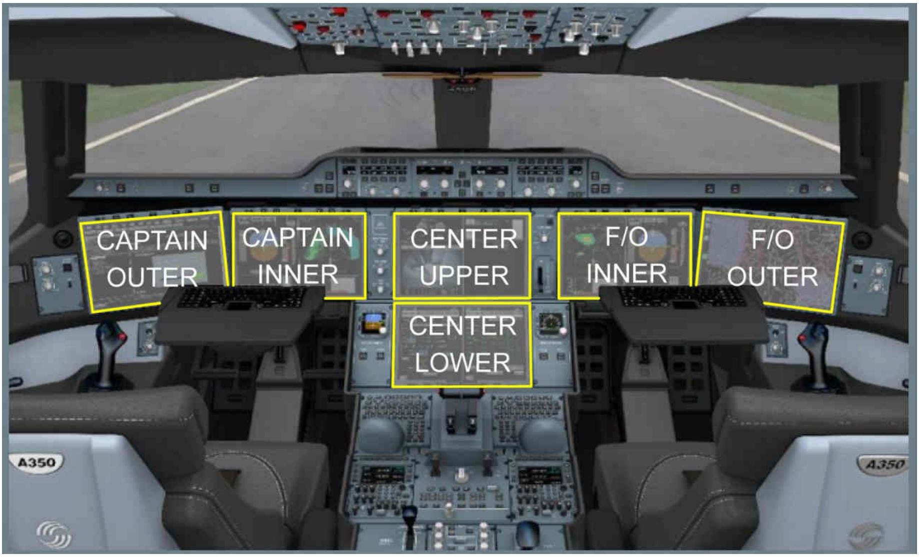
CAUTION	The cleaning of the display units must be performed by the maintenance personnel. An incorrect application of the cleaning procedure may cause permanent damage to the screen.

The CDS has 6 identical and interchangeable Display Units (DUs).

L2 Each DU is based on Liquid Crystal Display (LCD) technology and has a large horizontal display area.

L1 The 6 DUs are referred to as (from left to right):
- Captain outer DU
- Captain inner DU
- Center upper DU
- Center lower DU
- First Officer inner DU
- First Officer outer DU.

Display Unit Arrangement



Each DU is able to process all of the following functions:
- EFIS
- ECAM
- MFD
- OIS
- Mailbox
- Videos.

L3 The DU can directly display the function, or process the function for another DU.

L1 In normal operations, each DU is assigned to display one of the above functions. However, for operational needs, the flight crew can manually reconfigure the DUs. *Refer to DSC-31-CDS-30-30 Normal Operations*.

In abnormal operations, in the case of a DU failure, automatic or manual DU reconfigurations enable the flight crew to display any relevant information on the remaining DUs. *Refer to DSC-31-CDS-30-40 Overview*.

DISPLAY UNIT MONITORING

Ident.: DSC-31-CDS-30-10-00000749.0001001 / 08 JUL 19
Applicable to: ALL

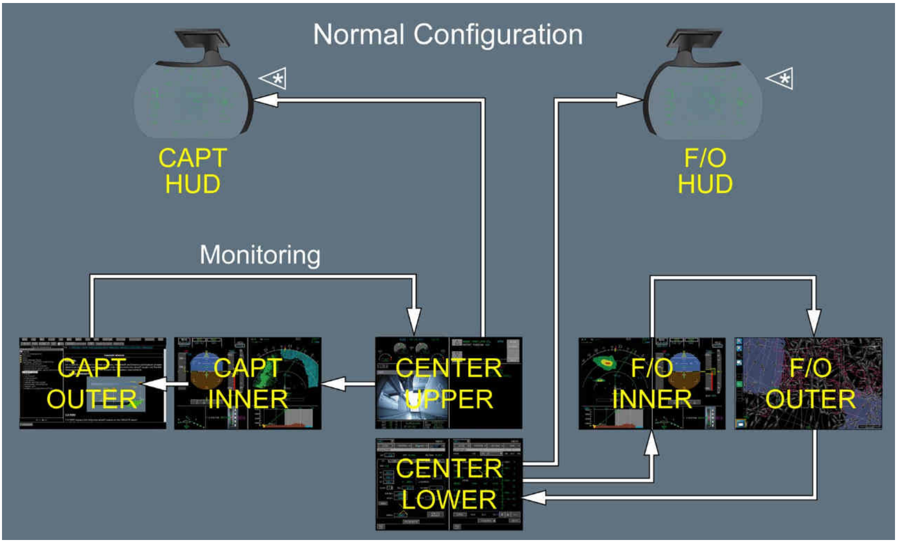
DU MONITORING

Each DU has a display unit monitoring function, which detects erroneous display of the following indications:
- On the PFD
  - The pitch,
  - The roll,
  - The altitude,
  - The airspeed,
  - The heading,
  - The FD bars,
  - The FPV,
  - The FPD.
- On the ND
  - The runway condition,
  - The runway length.

- On the ED
  - The thrust,
  - The N1,
  - The EGT,
- The Fuel On Board (FOB) on the permanent data
- On the SD pages
  - The N2, N3 and the fuel flow, on the ENG SD page,
  - The fuel flow, on the CRUISE SD page,
  - The fuel temperatures and the fuel quantities on the FUEL SD page.

L2 A DU monitors another DU, which in turn monitors another DU. This makes a monitoring "loop". There are two independent feedback-monitoring loops, and each loop has three DUs.

Normal Configuration



L3 Aircraft systems send data including critical parameters to the CDS. Each DU performs a display process with an image signature sent to the adjacent DU. This adjacent DU performs a reversion of the display process in order to compare critical parameters with those sent by the aircraft systems.

L1 If a DU detects a discrepancy between the data that it receives from a given system and the data displayed on another DU, the ECAM will trigger the following alert: CDS DISPLAY DISAGREE.

DU MONITORING IN CASE OF DU FAILURE

If a DU fails, the DU monitoring loops are automatically reconfigured.

For example:
- If the CAPT OUTER DU fails, the CAPT INNER DU monitors the CENTER UPPER DU.
- If the F/O INNER DU fails, the CENTER LOWER DU monitors the F/O OUTER DU.

DISPLAY UNIT - USER INTERFACE RULES

Ident.: DSC-31-CDS-30-10-00000748.0001001 / 03 JUL 14
Applicable to: ALL

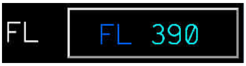
ENTRY FIELD

The flight crew uses the entry field to select and change data.

The entry field may:
- Be blank for free text: Data entry is optional
- Contains - -: Data entry is optional
- Contains ▯▯: Data entry is mandatory.

When applicable, the entry field also contains the unit of measurement.

Entry Field with Unit



FL

FL 390

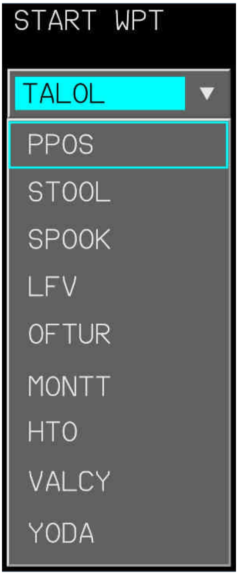
The flight crew can edit an entry field, by moving the cursor over the field. When the blue box appears, it is possible to modify the data, without first pressing the Validation pb.
When the data is entered, the flight crew presses the Validation pb, and the cursor jumps to the field that is most likely to be used next.

Note: *While an entry field is under edition, the flight crew can press the ENT key or the Validation pb to validate an entry. The flight crew can also press the ESC key to cancel the entry and recover the cursor.*

OPTION-LIST

The flight crew can select one of the listed items, by using the following controls of the Keyboard and Cursor Control Unit (KCCU):
- The scroll wheel, or
- The trackball, or
- The four direction arrow keys.

Option-List



START WPT

TALOL ▼

PPOS
STOOL
SPOOK
LFV
OFTUR
MONTT
HTO
VALCY
YODA

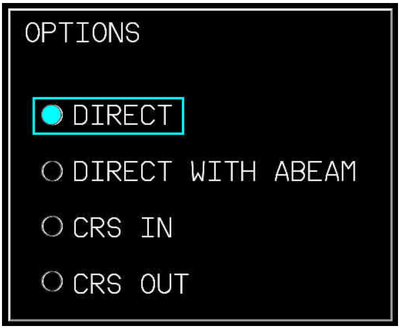
When the item is selected, the flight crew presses the Validation pb, or the ENT key, and the cursor moves to the field that is most likely to be used next.

Note: *For some option-lists, the flight crew can type in data, other than those listed. When the data is typed, the list disappears.*

BULLETED ITEM

The flight crew can select only one of the options in a bulleted list, by clicking on the option.

Selection Bullet



OPTIONS

● DIRECT

○ DIRECT WITH ABEAM

○ CRS IN

○ CRS OUT

TICK-BOX

The flight crew can select/deselect one or more of the items listed in a tick-box, by clicking on the applicable item(s).
When selected, a tick appears next to the applicable item.

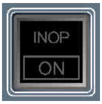
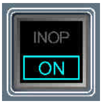
CAPT(F/O) OIS ON CENTER pb

Ident.: DSC-31-CDS-30-20-00011272.0001001 / 17 APR 14
Applicable to: ALL

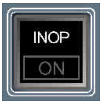


The CAPT(F/O) OIS is displayed on the CAPT(F/O) outer DU.



The CAPT(F/O) OIS is displayed on the center lower DU.

L12



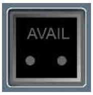
The CAPT(F/O) OIS cannot be displayed on the center lower DU.

The OIS ON CENTER function is not available because:
- The ECAM is displayed on the center lower DU, or
- The center lower DU is failed, or
- The outer and inner DUs are failed on both CAPT and F/O side.

L2 For more information about display reconfiguration, *Refer to DSC-31-CDS-30-30 Normal Operations*

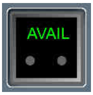
DISPLAY CYCLE pb

Ident.: DSC-31-CDS-30-20-00011274.0001001 / 17 APR 14
Applicable to: ALL



The flight crew cannot change the display configuration of the DU, except via the CAPT(F/O) OIS ON CENTER pb.

L12



Due to a change in the standard display configuration, the flight crew can change the display of one of the onside DU.
If two DUs or more are failed, several displays can be possible on a single DU. In this case, the flight crew presses the DISPLAY CYCLE pb several times to cycle the available displays.
For more information, *Refer to DSC-31-CDS-30-30 Normal Operations*.

DISPLAY UNIT CONTROLS

Applicable to: ALL

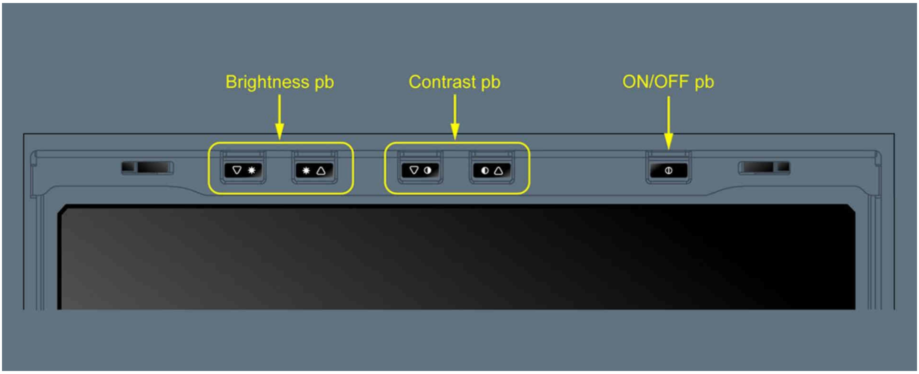
Display Unit Controls



Ident.: DSC-31-CDS-30-20-GDUCO-00001048.0001001 / 17 APR 14

BRIGHTNESS PB

When pressed, increases the brightness of the associated DU.

When pressed, decreases the brightness of the associated DU.

Note: *The brightness is also automatically tuned (in a limited range) according to the ambient light in the cockpit, via the two light sensors that are located at the bottom of each DU.*

Ident.: DSC-31-CDS-30-20-GDUCO-00001049.0001001 / 28 APR 17

CONTRAST PB

The contrast pb enables the flight crew to modify the contrast of:

- The weather radar background on the ND
- The terrain background on the ND

L2 In the case of a terrain alert, the background lighting is set to 75 % of the overall lighting. After the alert, the lighting returns to its default value.

L1
- The general contrast of the OIS
- The general contrast of the System Page, or System Display page (SD).

L2 *Note:* *When pressed, the contrast pb has no effect on the display of MFD session.*

L1

When pressed, increases the contrast of the associated DU.

When pressed, decreases the contrast of the associated DU.

Ident.: DSC-31-CDS-30-20-GDUCO-00001051.0001001 / 17 APR 14

ON/OFF PB

When pressed, turns on or off the DU.

BRT
DOME LT
OFF
BRT
STORM
DU MASTER BRT
INHIBIT
ON
DU Master Brightness knob

The DU MASTER BRT knob is used in order to increase or decrease the brightness of the 6 DUs simultaneously.

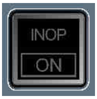
The external ring of the DU MASTER BRT knob enables the flight crew to switch ON/OFF the brightness control of all the display units.

The internal ring of the DU MASTER BRT knob enables the flight crew to adjust the brightness of all the display units with the respective difference that is set on each display unit.

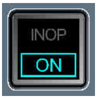
L2 One increment of +/-1 of the internal ring is similar to a press on a DU Brightness pb.
The difference in brightness among the display units is kept during brightness setting.

OIS VIEW OFFSIDE pb

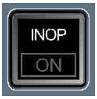
Ident.: DSC-31-CDS-30-20-00011275.0001001 / 17 APR 14
Applicable to: ALL



The CAPT(F/O) OIS displays the CAPT(F/O) OIS on the onside DU.



The onside outer DU displays the offside OIS.



The OIS VIEW OFFSIDE pb is not available because:
- The other flight crewmember sets the OIS VIEW OFFSIDE to ON, or
- The other flight crewmember selects the CAPT(F/O) OIS ON CENTER to ON, or
- The function is not available due to an automatic display reconfiguration on the outer DU.

L2 For more information about display reconfiguration, *Refer to DSC-31-CDS-30-30 Normal Operations*.

Intentionally left blank

NORMAL OPERATIONS

Ident.: DSC-31-CDS-30-30-00000092.0001001 / 07 MAY 18
Applicable to: ALL

In normal operations:

- CAPT outer DU displays the CAPT OIS
- CAPT inner DU displays the CAPT EFIS
- Center upper DU displays the ECAM and the Mailbox
- Center lower DU displays the CAPT and F/O MFDs
- F/O inner DU displays the F/O EFIS
- F/O outer DU displays the F/O OIS

OVERVIEW

Ident.: DSC-31-CDS-30-40-00000087.0001001 / 17 APR 14
Applicable to: ALL

When one or more DUs fail, DUs reconfigurations enable the flight crew to display all the relevant information on the remaining DUs.

The CDS has two types of reconfigurations:
- Automatic reconfiguration: The CDS automatically reconfigures the DUs in order to display by order of priority:
  - The EFIS and the ECAM
  - The MFD
  - The OIS

  Note: *The priorities of the automatic reconfigurations are always applicable regardless of which DU is able to display the EFIS, ECAM, MFD or OIS.*

  Refer to Automatic Reconfiguration.
- Manual reconfiguration: Following an automatic reconfiguration, the flight crew can recover the missing information via a manual reconfiguration.
  Refer to Manual Reconfiguration.

AUTOMATIC RECONFIGURATION

Ident.: DSC-31-CDS-30-40-00005111.0001001 / 17 APR 14
Applicable to: ALL

Two functions and displays are considered as more important for continuing the flight: The EFIS and the ECAM.
- The EFIS is displayed on the CAPT inner DU and the F/O inner DU
- The ECAM is displayed on the center upper DU

In the case of failure of a DU that displays the EFIS or the ECAM, the CDS automatically reconfigures the remaining DUs.

IF CAPT(F/O) INNER DU FAILS

If the CAPT(F/O) inner DU fails, the CDS automatically displays the EFIS on the CAPT(F/O) outer DU.

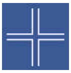
Ident.: DSC-31-CDS-40-20-20-10-00002642.0001001 / 22 APR 14

SIDESTICK ORDER

L3 The FCDC provides the sidestick order.

L1



Indicates the sum of the sidestick orders of the Captain and the First Officer. Appears on ground, after the start of at least one engine.

Note: *The flight crew must not use the sidestick order indication for the flight controls check, because this indication does not show the actual position of the flight control surfaces.*

Ident.: DSC-31-CDS-40-20-20-10-00002643.0001001 / 03 DEC 15

MAXIMUM SIDESTICK DEFLECTION

On ground, the maximum sidestick deflection zone appears on the PFD after the first engine start.

L2 The maximum sidestick deflection is 18 ° pitch up or down, and 20 ° in roll left or right.

Ident.: DSC-31-CDS-40-20-20-10-00002644.0001001 / 22 APR 14

FD YAW BAR

L3 The PRIMs provide the FD yaw bar orders.

L1

Indicates the required rudder input in order to maintain the aircraft on the runway centerline.

Appears when:
- The FD is engaged
- A Localizer (LOC) signal is available
- One of the following modes is active: RWY, FLARE, or ROLL OUT.

For more information about the FD yaw bar, *Refer to DSC-22-FG-30-20 FD Display*.

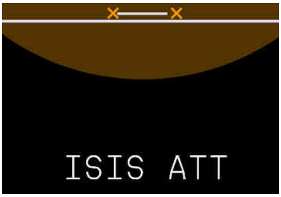
No attitude data is available. The attitude and guidance indications no longer appear.
Temporarily flashes, then remains steady.

L12



Appears when the attitude data is based on the ISIS.
The automatic monitoring rejected the inertial data of the three IRs.
For more information about the ADIRS monitoring, *Refer to DSC-34-NAV-20-10-50 ADIRS Monitoring*.

Ident.: DSC-31-CDS-40-20-30-10-00002689.0001001 / 22 APR 14

AIRCRAFT REFERENCE

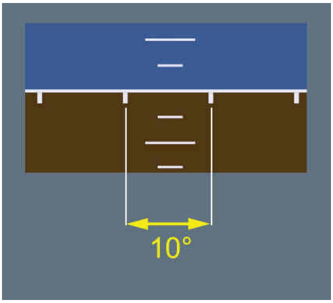
Indicates the fixed reference position of the aircraft.

Ident.: DSC-31-CDS-40-20-30-10-00003746.0001001 / 01 JUL 14

HORIZON LINE

L3 The ADIRS provide pitch and roll data that is necessary for the display of the horizon line.

L12



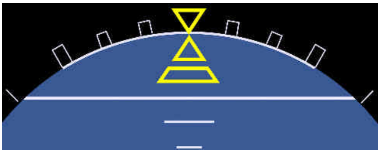
The horizon line has heading markers every 10 °.
The heading markers are not displayed when the ISIS inertial data is displayed.
For more information about the display of the ISIS inertial data on the PFD, *Refer to DSC-34-NAV-20-30 Display of ISIS Inertial Data*.

Ident.: DSC-31-CDS-40-20-30-10-00002690.0001001 / 01 JUL 14

BANK ANGLE

L2 The IRs provide the bank angle information.
In the case of a failure or a rejection of all IRs, the ISIS provides the bank angle information. For more information, *Refer to DSC-34-NAV-20-30 Display of ISIS Inertial Data*.

L1



The scale has markers at 0 °, 10 °, 20 °, 30 ° and 45 ° of bank.

Ident.: DSC-31-CDS-40-20-30-10-00002691.0001001 / 03 DEC 15

BANK ANGLE PROTECTION

L3 The FCDC provides the bank angle protection.

L1

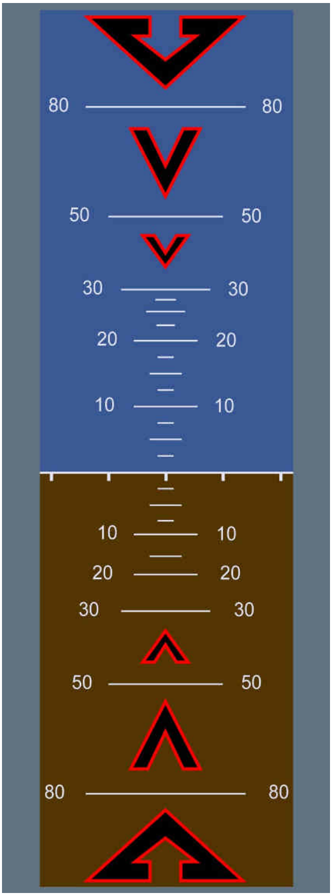
	Indicates the bank angle protection in normal law. Appears at 67 ° of bank. For more information about the bank angle protection in normal law, *Refer to DSC-27-10-30 Flight Law*.
	The bank angle protection is lost. The flight controls are in alternate or direct law.

Ident.: DSC-31-CDS-40-20-30-10-00002692.0001001 / 01 JUL 14

PITCH

L2 The IRs provide the pitch attitude and the FPA information.
In the case of a failure or a rejection of all IRs, the ISIS provides the pitch attitude information. For more information, *Refer to DSC-34-NAV-20-30 Display of ISIS Inertial Data*.

L1 The scale, associated with the aircraft reference and the Flight Path Vector (FPV), indicates the pitch attitude and the Flight Path Angle (FPA) of the aircraft.



The pitch scale has markers:

- Every 2.5 °, between 10 ° pitch down and 30 ° pitch up
- Every 5 °, between 10 ° pitch down and 20 ° pitch down
- At 30 °, 50 °, and 80 ° pitch up or down.

Numeric values are also displayed at 10 °, 20 °, 30 °, 50 °, and 80 ° pitch up or down.

The V-shaped symbols indicate that the pitch attitude of the aircraft is excessive. These symbols also indicate the direction of the pitch correction required.

Ident.: DSC-31-CDS-40-20-30-10-00002693.0001001 / 22 APR 14

PITCH ATTITUDE PROTECTION

L3 The FCDC provides the pitch attitude protection.

L1

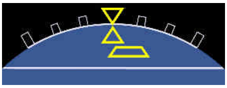
=	Indicates the limit of the pitch attitude protection in normal law. For more information about the pitch attitude protection in normal law, *Refer to DSC-27-10-30 Rotation Law*.
×	Indicates that the pitch attitude protection is lost. The flight controls are in alternate or direct law.

Ident.: DSC-31-CDS-40-20-30-10-00002694.0001001 / 07 NOV 16

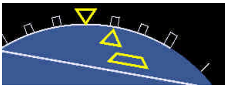
SIDESLIP INDEX

L3 The ADIRS provide the sideslip angle of the aircraft and the lateral acceleration.

L1

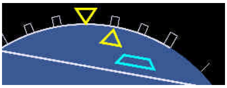


On ground, indicates the lateral acceleration of the aircraft.



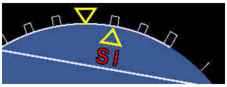
In flight, indicates the sideslip of the aircraft.

L13



The PRIMs provide the beta target information.
Appears if one engine fails during takeoff or go-around. The sideslip index becomes the beta target.
For more information about the beta target, *Refer to DSC-27-10-30 Flight Law*.

L12



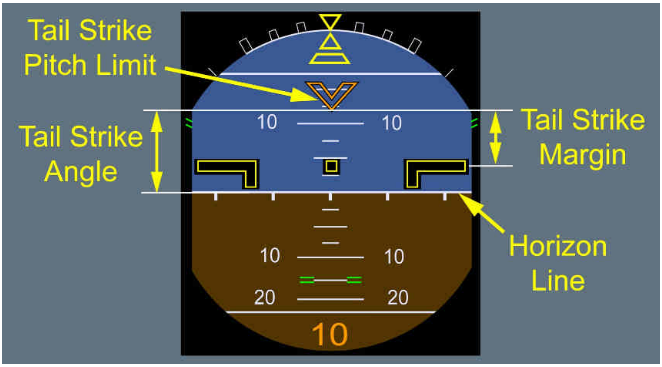
The sideslip and the lateral acceleration indications are not valid.
Temporarily flashes, then remains steady.

Ident.: DSC-31-CDS-40-20-30-10-00002695.0002001 / 08 APR 19

TAIL STRIKE PITCH LIMIT

L3 The PRIMs provide the tail strike pitch limit.

Tail Strike Pitch Limit



L1 Indicates the maximum pitch attitude, in order to avoid a tail strike during landing.

L2 The indication appears when the aircraft is below 400 ft RA height, at a fixed value corresponding to the pitch limit with the main landing gear compressed.

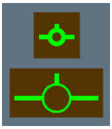
The indication no longer appears:
- When the ground speed is less than 50 kt, or
- 4 s after a go-around is initiated.

Ident.: DSC-31-CDS-40-20-30-10-00000809.0002001 / 09 MAR 18

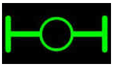
FLIGHT PATH VECTOR (FPV) OR VELOCITY VECTOR (VV)

L3 The ADIRS provide the flight path angle required to display the FPV or the VV.

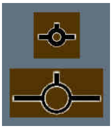
L1 The FPV(VV) indicates the lateral (i.e. track), and vertical (i.e. flight path angle) aircraft trajectory with respect to the ground, taking into account the wind effect.
With the TRK-FPA flying reference, the symbol is called FPV.
With the HDG-V/S flying reference, the symbol is called VV.



The FPV appears when the flight crew selects TRK-FPA via the HDG-V/S / TRK-FPA pb on the AFS CP.
If the FDs are not engaged, the size of the symbol increases.

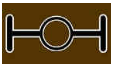


Appears when the FPV uses inertial data from ISIS.
The FPV is horizontally locked (no drift).



The VV appears when the flight crew:
- Selects HDG-V/S via the HDG-V/S / TRK-FPA pb on the AFS CP
- Presses the VV pb on the EFIS CP.

If the FDs are not engaged, the size of the symbol increases.



Appears when the VV uses inertial data from ISIS.
The VV is horizontally locked (no drift).

Airspeed

AIRSPEED

Ident.: DSC-31-CDS-40-20-40-00000778.0001001 / 22 APR 14
Applicable to: ALL

The following general airspeed indications appear during all flight phases:
- The speed reference line
- The airspeed target
- The speed trend arrow
- The Mach number (over the crossover altitude)
- Green dot speed (in clean configuration only).

For more information, *Refer to DSC-31-CDS-40-20-40 General Airspeed Indications*.

The following airspeed indications appear during specific flight phases:
- During takeoff:
  - V1
  - VR
  - V2
  - The short term managed speed
  - VFE next
  - F speed
  - S speed
  - The automatic retraction speed.

  For more information, *Refer to DSC-31-CDS-40-20-40 Airspeed Indications During Takeoff*.
- During descent:
  - VFE next
  - F speed
  - S speed
  - The short term managed speed
  - Lower and upper speed range limits.

  For more information, *Refer to DSC-31-CDS-40-20-40 Airspeed Indications During Descent*.
- After touchdown:
  - The DECEL indication.

  For more information, *Refer to DSC-31-CDS-40-20-40 Airspeed Indications After Touchdown*.

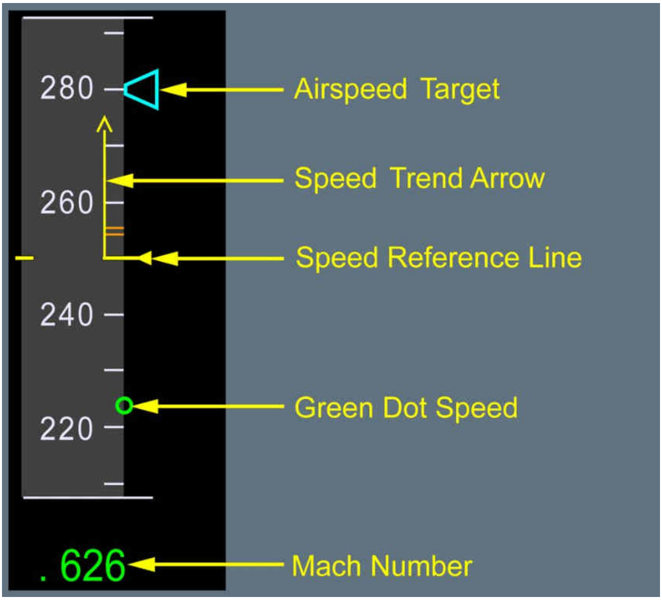
During flight, the airspeed scale also displays the following protection speeds:
- VMAX and the high speed protection indication
- VLS
- $V\alpha_{prot}$ (in normal law)
- $V\alpha_{max}$ (in normal law)
- $V\alpha_{sw}$ (in alternate and direct law).
  For more information, *Refer to DSC-31-CDS-40-20-40 Airspeed Protections*.

GENERAL AIRSPEED INDICATIONS

Applicable to: ALL

1 Ident.: DSC-31-CDS-40-20-40-10-00000779.0002001 / 03 JUL 20

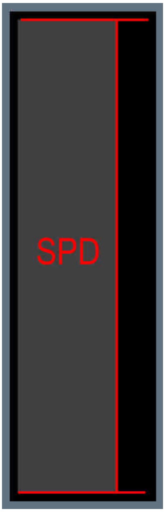
General Airspeed Indications



280
260
240
220
.626
Airspeed Target
Speed Trend Arrow
Speed Reference Line
Green Dot Speed
Mach Number

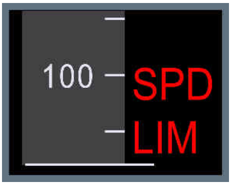
The airspeed scale starts at 30 kt with markers every 10 kt. In addition, numeric values are displayed every 20 kt and start at 40 kt.

L12



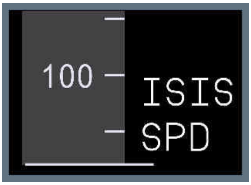
Appears instead of the airspeed scale if no speed information is available.
Temporarily flashes, then remains steady.

L12



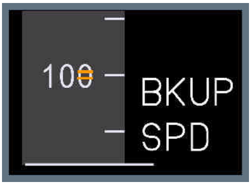
Appears when the minimum reference speed (VLS) or the maximum reference speed (VMAX) is lost.
Temporarily flashes, then remains steady.

L12



Appears when the ISIS speed indication is displayed on the PFD.
For more information about the display of the ISIS speed on the PFD, *Refer to DSC-34-NAV-20-30 Display of ISIS Speed and Altitude Indications*.

L12



Appears when the backup speed indication (from FADECs and AOA probes) is displayed on the PFD.
The accuracy of the speed is degraded, and the speed appears with a precision of ±10 kt.
For more information about the backup speed indications, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.

Ident.: DSC-31-CDS-40-20-40-10-00019284.0001001 / 22 APR 14

SPEED REFERENCE LINE

L3 The ADRs provide the current airspeed value.

L1

Indicates the current airspeed of the aircraft in knots.

Ident.: DSC-31-CDS-40-20-40-10-00019285.0001001 / 22 APR 14

SPEED TREND ARROW

L3 The PRIMs provide the speed trend information.

L12

Indicates the airspeed that the aircraft will reach in 10 s, if the current acceleration(deceleration) remains constant.
Appears when the speed trend exceeds 2 kt.
Disappears when the speed trend is less than 1 kt.

Ident.: DSC-31-CDS-40-20-40-10-00019286.0001001 / 22 APR 14

AIRSPEED TARGET

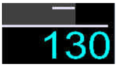
L3 The PRIMs provide the airspeed target information. If all three PRIMs are lost, the FCU backup provides the airspeed target information.

L1 Indicates the airspeed target on the airspeed scale.

L12

The airspeed target is selected.
The airspeed target is manually selected on the AFS CP, or manually entered in the FMS.
The selected airspeed target is within the airspeed scale.

L12

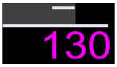


The airspeed target is selected.
The airspeed target is manually selected on the AFS CP, or manually entered in the FMS.
The selected airspeed target is outside the airspeed scale.

L12

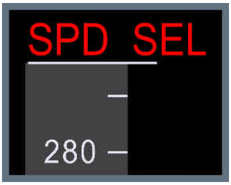
The airspeed target is managed.
The airspeed target is computed by the FMS.
The airspeed target is within the airspeed scale.

L12



The airspeed target is managed.
The airspeed target is computed by the FMS.
The airspeed target is outside the airspeed scale.

L12



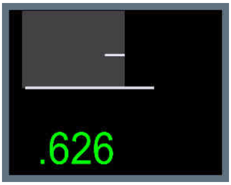
The airspeed selected on the AFS CP is not available.
Temporarily flashes, then remains steady.

Ident.: DSC-31-CDS-40-20-40-10-00019287.0001001 / 01 JUL 14

MACH NUMBER

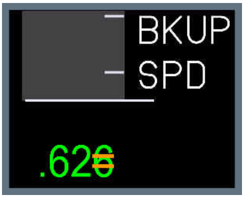
L3 The ADRs provide the Mach number information.

L1



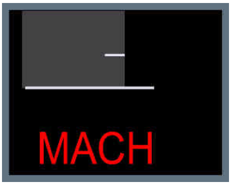
Appears below the airspeed scale, when the Mach number exceeds M 0.5.
Disappears when the Mach number is less than M 0.45.

L12



Appears when the backup speed indication (from FADECs and AOA probes) is displayed on the PFD.
The accuracy of the Mach number is degraded, and the Mach number appears with a precision of ±M 0.03.
For more information about the backup speed indications, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.

L12



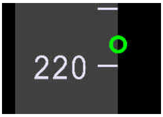
The Mach number is not available.
Temporarily flashes, then remains steady.

Ident.: DSC-31-CDS-40-20-40-10-00019654.0001001 / 22 APR 14

GREEN DOT SPEED

L3 The PRIMs provide the green dot speed.

L1



Appears in clean configuration only.
For more information about the green dot speed, *Refer to DSC-22-27-10-20 GREEN DOT*.

AIRSPEED INDICATIONS DURING TAKEOFF

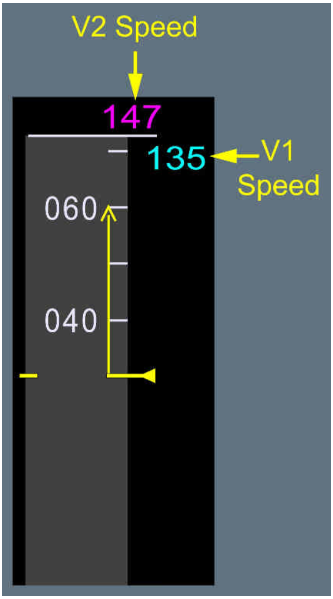
Applicable to: ALL

Ident.: DSC-31-CDS-40-20-40-20-00000780.0001001 / 22 APR 14

BEFORE LIFTOFF

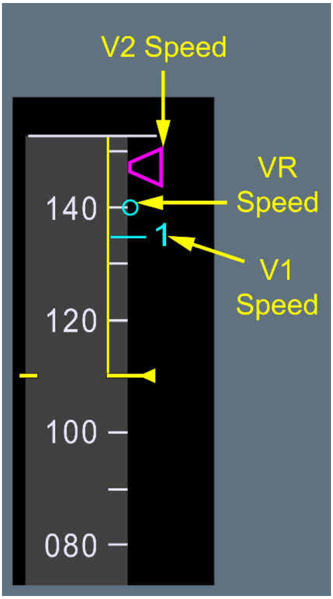
L3 The FMS provides the values of V1, VR, and V2 that the flight crew entered.

L1



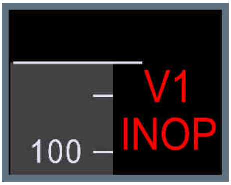
Until the aircraft reaches a sufficient speed, V1 and V2 are outside the airspeed scale. Only the values are displayed at the top of the airspeed scale.
For more information about V1, *Refer to DSC-22-27-10-20 V1*.
For more information about V2, *Refer to DSC-22-27-10-20 V2*.

L12



When V1, VR, and V2 are within range of the airspeed scale, they are displayed as markers and located in accordance with the values that the flight crew entered in the T.O panel of the FMS ACTIVE/PERF page.
For more information about VR, *Refer to DSC-22-27-10-20 VR*.
V1 and VR no longer appear after liftoff.

L12



V1 is not valid.
Temporarily flashes, then remains steady.

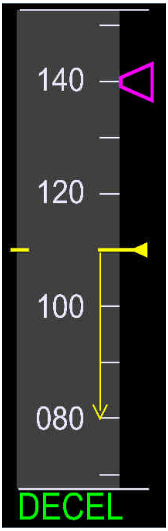
L13

The PRIMs provide the speed range limits.
Indicates the range of aircraft speeds that permits to maintain an appropriate vertical trajectory.
Appears during a managed descent only.
For more information about the speed range limits, *Refer to DSC-22-FG-60-20 FMS Speed/Mach Target*.

	When the aircraft is below 20 000 ft, indicates the speed limit of the next flap configuration, also referred to as VFE next. For more information about VFE next, *Refer to DSC-22-27-10-20 VFE NEXT*.
	Appears when the FLAPS lever is set to 1, also referred to as S speed. For more information about the S speed, *Refer to DSC-22-27-10-20 S*.
	Appears when the FLAPS lever is set to 2 or 3, also referred to as F speed. For more information about the F speed, *Refer to DSC-22-27-10-20 F*.
	Indicates the short-term managed speed, when the speed is either managed or selected. For more information about the short-term managed speed, *Refer to DSC-22-FG-60-20 Short-Term Managed Speed*.

AIRSPEED INDICATIONS AFTER TOUCHDOWN

Ident.: DSC-31-CDS-40-20-40-00000782.0001001 / 22 APR 14
Applicable to: ALL



After touchdown, the only indications that appear on the airspeed scale are:
- The current airspeed
- The speed trend arrow
- The selected or managed speed before touchdown.

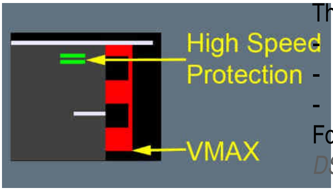
DECEL	The autobrake is active, and the aircraft decelerates. Appears below the speed scale, when the aircraft deceleration rate reaches at least 80 % of the selected deceleration. No longer appears when the aircraft deceleration rate is less than 70 % of the selected deceleration. *Note:* *On a slippery runway, the A-SKID may be activated before the aircraft reaches the selected deceleration. Therefore, the DECEL indication may not appear, even if the autobrake is active.*

AIRSPEED PROTECTIONS

Ident.: DSC-31-CDS-40-20-40-00000783.0001001 / 04 MAY 16
Applicable to: ALL

L3 The PRIMs provide the speed protection information. If all three PRIMs are lost, the ADRs provide the VMO/MMO information.

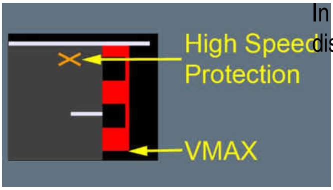
L1 MAXIMUM SPEED



The VMAX is the lowest of the following speeds:
- VMO/MMO
- VLE
- VFE.

For more information about the VMAX definition, *Refer to DSC-22-27-10-20 VMAX*.

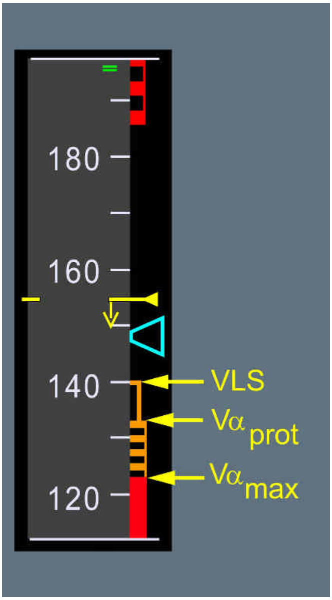
In normal law, the symbol = indicates that the high speed protection is available.
For more information about the high speed protection, *Refer to DSC-22-27-20 High Speed Protection*.



In alternate or direct law, the VMAX indication remains displayed, but the high speed protection is not available.

MINIMUM SPEEDS

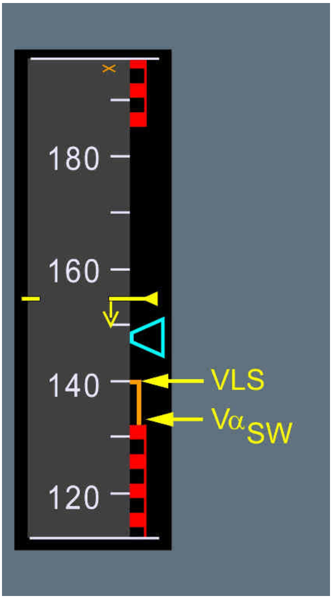
MINIMUM SPEEDS IN NORMAL LAW



The protection speeds in normal law are:

- The minimum selectable speed, also referred to as VLS
  For more information about VLS, *Refer to DSC-22-27-10-20 VLS*.
- The alpha protection speed, also referred to as $V\alpha_{prot}$
  For more information about $V\alpha_{prot}$, *Refer to DSC-22-27-10-20 V alpha prot*.
- The alpha max speed, also referred to as $V\alpha_{max}$.
  For more information about $V\alpha_{max}$, *Refer to DSC-22-27-10-20 V alpha Max*.

MINIMUM SPEEDS IN ALTERNATE OR DIRECT LAW



The protection speeds in alternate or direct law are:

- VLS
- The stall warning speed, also referred to as $V\alpha_{sw}$. For more information about $V\alpha_{sw}$, *Refer to DSC-22-27-10-20 V alpha sw*.

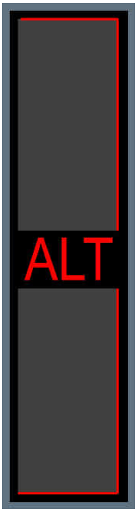
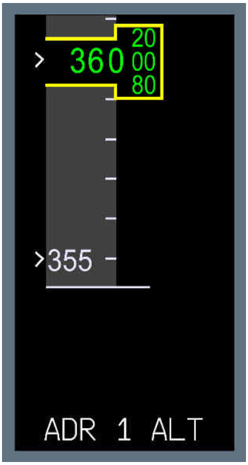
Barometric Reference

L12



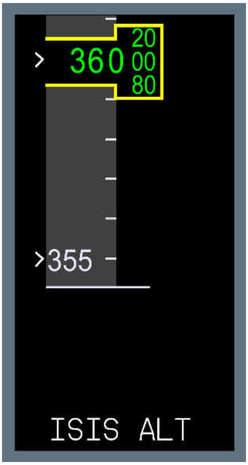
Appears instead of the altitude scale, if the altitude data, with the reference selected on the AFS CP, is not available.
Temporarily flashes, then remains steady.

L12



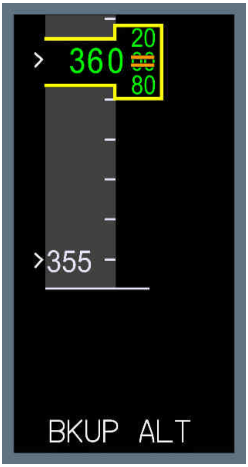
Appears on both PFDs when the altitude is based on only one ADR. The automatic monitoring rejected the other ADRs for altitude data. The required equipment for RVSM is not operative.
For more information about RVSM, *Refer to PRO-SPO-RVSM Required Equipment and Functions*.
For more information about the ADIRS monitoring, *Refer to DSC-34-NAV-20-10-50 ADIRS Monitoring*.

L12



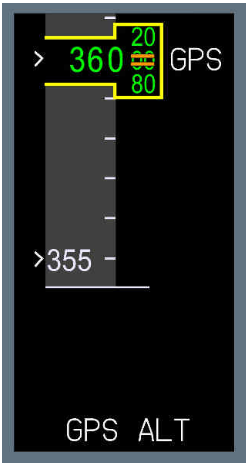
Appears when the ISIS altitude indication is displayed on the PFD. The required equipment for RVSM is not operative.
For more information about RVSM, *Refer to PRO-SPO-RVSM Required Equipment and Functions*.
For more information about the display of the ISIS altitude indication on the PFD, *Refer to DSC-34-NAV-20-30 Display of ISIS Speed and Altitude Indications*.

L12



Appears when the backup altitude indication (from FADECs) is displayed on the PFD. The required equipment for RVSM is not operative.
For more information about RVSM, *Refer to PRO-SPO-RVSM Required Equipment and Functions*.
For more information about the backup altitude indications, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.

L123



Appears when the ADRs, the ISIS, and the backup altitude (from FADECs) no longer provide the altitude. The backup GPS altitude is displayed on the PFD.
The backup GPS altitude remains available via the PRIMs.
The required equipment for RVSM is not operative.
For more information about RVSM, *Refer to PRO-SPO-RVSM Required Equipment and Functions*.

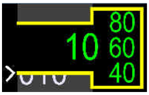
Ident.: DSC-31-CDS-40-20-50-10-00000787.0001001 / 04 DEC 14

CURRENT ALTITUDE

L3 The ADRs provide the current altitude information.
If the automatic monitoring of air data rejects the altitude of the three ADRs, the ISIS provides the current altitude information. For more information about the ADIRS monitoring, *Refer to DSC-34-NAV-20-10-50 ADIRS Monitoring*.

L1 The altitude scale has markers every 100 ft.

L12

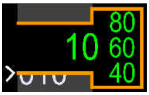


Indicates the current altitude in feet.

Pulses, when the difference between the current altitude and the selected altitude:
- Decreases
- Is between 200 ft and 750 ft.

For more information about altitude alerts, *Refer to DSC-31-CDS-40-20-60 Altitude Alerts*.

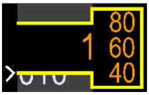
L12



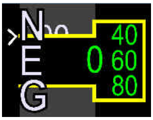
Indicates the current altitude in feet.

Flashes, when the difference between the current altitude and the selected altitude:
- Increases
- Is above 200 ft.

For more information about altitude alerts, *Refer to DSC-31-CDS-40-20-60 Altitude Alerts*.

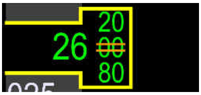


The current altitude is equal to, or below the minimum entered in the FMS PERF page.



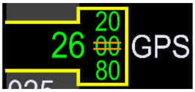
The current altitude is negative.

L12



The ADRs and the ISIS no longer provide the altitude. The backup altitude (from FADECs) is displayed.
The accuracy of the altitude is degraded, and the altitude appears with a precision of ±500 ft.
For more information about the display of the backup altitude, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.

L13



The ADRs, the ISIS, and the backup altitude (from FADECs) no longer provide the altitude.
The backup GPS altitude remains available via the PRIMs.
The displayed GPS altitude is different from the barometric altitude.

Ident.: DSC-31-CDS-40-20-50-10-00000788.0001001 / 18 JUN 15

ALTITUDE TARGET

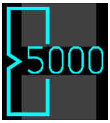
L3 The PRIMs provide the altitude target. If all three PRIMs are lost, the FCU backup provides the altitude target.

L1 The altitude target indicates:
- An altitude, when the selected barometric reference is QNH, or
- A FL, when the selected barometric reference is STD.

L2 Appears on top of the altitude scale if the selected altitude is above the current altitude.
Appears below the altitude scale if the selected altitude is below the current altitude.

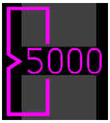
L1

Indicates the AFS CP selected altitude when the vertical guidance is either selected or managed.
The altitude target is outside the altitude scale.



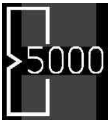
Indicates the AFS CP selected altitude when the vertical guidance is either selected or managed.
The altitude target is within the altitude scale.

Indicates an altitude constraint when the vertical guidance is managed.
The altitude constraint is outside the altitude scale.



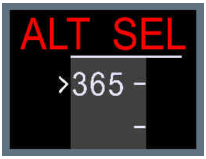
Indicates an altitude constraint when the vertical guidance is managed.
The altitude constraint is within the altitude scale.

Indicates the AFS CP selected altitude when a vertical approach mode is engaged (G/S, G/S*, F-G/S, F-G/S*, APP-DES, LAND, FLARE, or ROLL OUT).
The aircraft disregards this altitude target when a vertical approach mode is engaged.
The altitude target is outside the altitude scale.



Indicates the AFS CP selected altitude when a vertical approach mode is engaged (G/S, G/S*, F-G/S, F-G/S*, APP-DES, LAND, FLARE, or ROLL OUT).
The aircraft disregards this altitude target when a vertical approach mode is engaged.
The altitude target is within the altitude scale.

L12



Appears if the following information cannot be displayed:
- The altitude that the flight crew selected on the AFS CP
- The altitude that the flight crew selected on the FCU backup pages of the MFD
- The altitude constraints from the FMS.

Temporarily flashes, then remains steady.

Ident.: DSC-31-CDS-40-20-50-10-00000789.0001001 / 06 NOV 14

VERTICAL DEVIATION

L3 The FMS provides the vertical deviation.

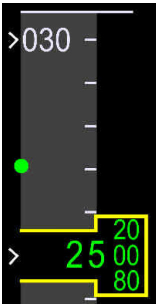
L1 The vertical deviation is the difference between the current altitude of the aircraft and the theoretical vertical profile of the FMS.

L2 The vertical deviation symbol appears when:

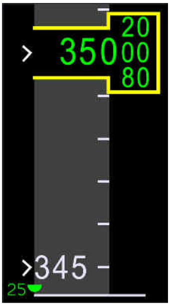
- The aircraft reaches the Top of Descent (T/D), or
- The FMS flight phase is descent, or approach.

The vertical deviation (VERT DEV) also appears on the DES and APPR panels of the FMS PERF page.
If the backup altitude is manually or automatically selected, the vertical deviation is not displayed.
For more information about the display of the backup altitude, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.

L1



When the vertical deviation is less than 540 ft, the vertical deviation symbol is a green disk, located at the theoretical FMS altitude.



When the vertical deviation exceeds 540 ft, the vertical deviation symbol is a green half disk, located at the altitude scale limits. In this case, it is associated with the numerical value displayed on two digits, in hundreds of feet.

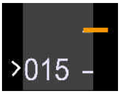
L2 *Note:* *When the aircraft is in a holding pattern, the vertical deviation is the difference between the altitude of the aircraft and the altitude of the holding exit. For more information, Refer to DSC-22-FMS-10-40-20 Controls and Indicators.*

Ident.: DSC-31-CDS-40-20-50-10-00000790.0001001 / 06 NOV 14

MINIMUM

L3 The FMS provides the minimum entered in the BARO(RADIO) entry field of the APPR panel of the FMS PERF page.

L12



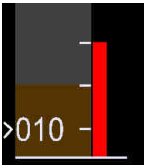
The amber dash along the altitude scale indicates the minimum entered in the FMS PERF page. For more information, *Refer to DSC-22-FMS-20-20-20 BARO/RADIO Entry Fields*.
Appears when the difference between the current aircraft altitude and the minimum entered in the BARO field of the APPR panel of the FMS PERF page is less than 570 ft.
Not displayed if the backup altitude is manually or automatically selected.
For more information about the display of the backup altitude, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.

Ident.: DSC-31-CDS-40-20-50-10-00000791.0001001 / 06 NOV 14

LANDING ELEVATION

L3 The FMS provides the landing elevation information.

L12



The brown area indicates the landing elevation of the destination airport of the flight plan.

Appears when:
- The barometric reference is QNH
- The aircraft is:
  - In final approach, or
  - On ground, with a ground speed above 80 kt.
- The difference between the landing elevation and the current aircraft altitude is less than 570 ft.

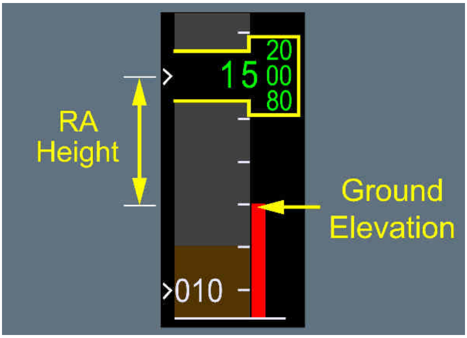
If the backup altitude is manually or automatically selected, the landing elevation is not displayed. For more information about the display of the backup altitude, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.

Ident.: DSC-31-CDS-40-20-50-10-00000792.0001001 / 22 APR 14

GROUND REFERENCE

L3 The radio altimeters provide the ground reference information.

L1



The vertical red line indicates the ground elevation. Appears when the aircraft is below 570 ft RA.

Ident.: DSC-31-CDS-40-20-50-10-00000793.0001001 / 04 MAY 16

BAROMETRIC REFERENCE

L3 The ADRs provide the selected barometric reference.

L1

QNH 1017

The flight crew sets the barometric reference to QNH and selected the barometric unit in hPa.

QNH 30.03

The flight crew sets the barometric reference to QNH and selected the barometric unit in inches of mercury.

STD

The flight crew sets the barometric reference to STD.

L2 Flashes when the flight crew selected:

- QNH on the EFIS CP, and the aircraft is in climb above the transition altitude, or
- STD on the EFIS CP, and the aircraft is in approach below the transition flight level.

Note: *If the transition altitude(level) is not available from the FMS, the default transition altitude(level) is automatically set to 2 500 ft RA height.*

L1 For more information about the barometric reference controls of the EFIS CP, *Refer to DSC-31-CDS-40-60 Barometric Reference*.

L2 If the automatic monitoring of air data rejects the altitude of the three ADRs, the barometric reference is no longer displayed on the PFD.
The flight crew can still set the barometric reference via the set/sel knob of the ISIS.

If the backup altitude is manually or automatically selected, only the STD barometric reference is available.

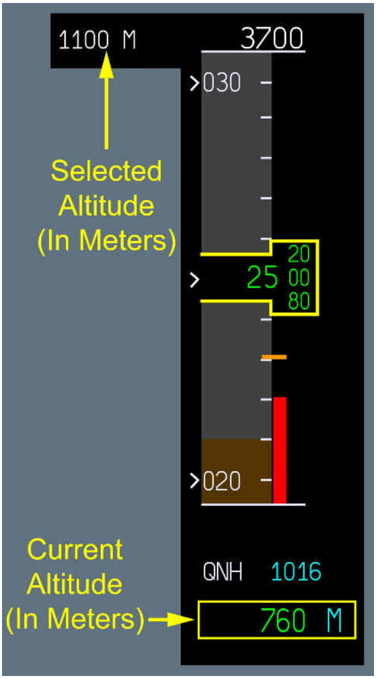
For more information about the display of the backup altitude, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.

Ident.: DSC-31-CDS-40-20-50-10-00000794.0001001 / 04 DEC 14

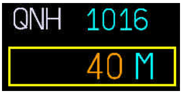
ALTITUDES IN METERS

L3 The PRIMs provide the altitudes in meters.

L1 The selected altitude and the current aircraft altitude indications appear in meters, when the flight crew presses the METER pb on the AFS CP.



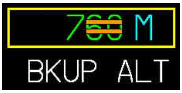
1100 M
3700
030
Selected Altitude (In Meters)
20
25 00
80
020
QNH 1016
Current Altitude (In Meters)
760 M



QNH 1016
40 M

The flight crew pressed the METER pb on the AFS CP.
Appears in amber(green) when the current altitude is below(above) the minimum entered in the FMS PERF page.

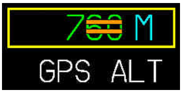
L12



760 M
BKUP ALT

The ADRs and the ISIS no longer provide the altitude. The backup altitude (from FADECs) is displayed.
The accuracy of the altitude is degraded, and the altitude appears with a precision of ±500 ft.
For more information about the display of the backup altitude, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.

L13



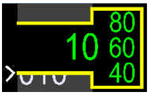
The ADRs, the ISIS, and the backup altitude (from FADECs) no longer provide the altitude.
The backup GPS altitude remains available via the PRIMs.
The displayed GPS altitude is different from the barometric altitude.

Intentionally left blank

Altitude Alerts

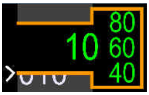
ALTITUDE ALERTS

Ident.: DSC-31-CDS-40-20-60-00000795.0001001 / 22 APR 14
Applicable to: ALL



When the aircraft approaches the selected altitude or flight level:
- The altitude frame pulses in yellow on the PFD
- The FWS generates a C chord sound for 1.5 s if the AP is not engaged.

L12



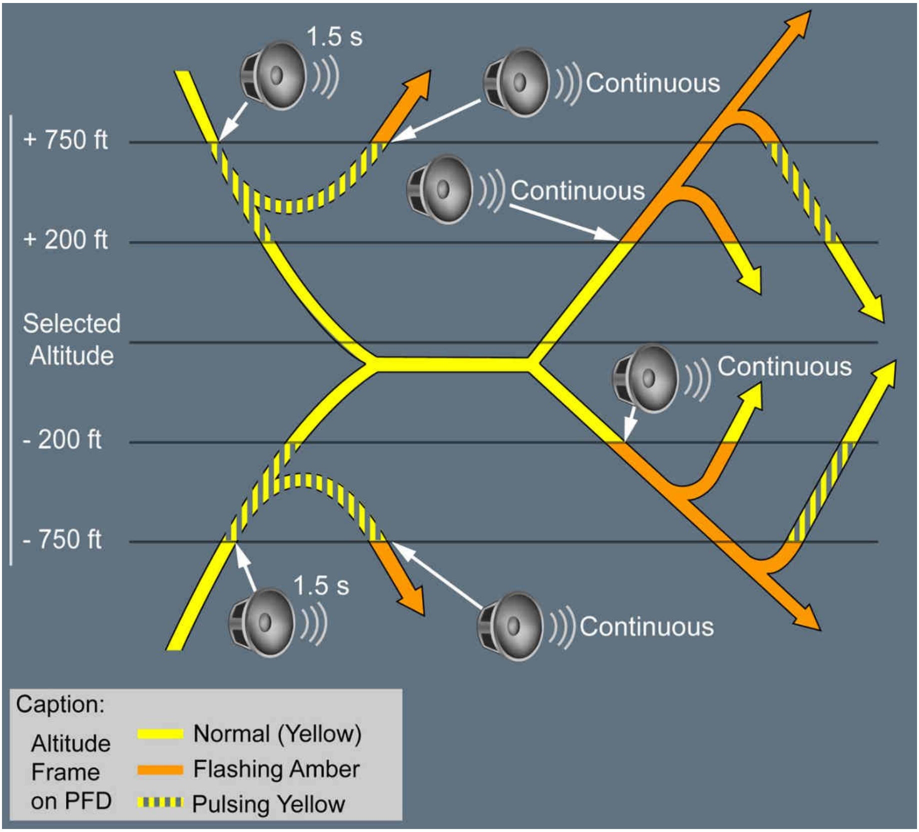
When the aircraft significantly deviates from the selected altitude or flight level:
- The altitude frame flashes in amber on the PFD
- The FWS generates a permanent C chord sound.

The C chord sound is no longer emitted when:
- The flight crew selects a new altitude target, or
- The flight crew presses the MASTER WARN pb, or
- The aircraft returns to the selected altitude.

C Chord Sound

L3 Altitude alerts are triggered when the altitude that the ADRs provide is different from the altitude selected on the AFS CP.

Altitude Alerts



1.5 s
Continuous
+ 750 ft
Continuous
+ 200 ft
Selected Altitude
Continuous
- 200 ft
- 750 ft
1.5 s
Continuous
Caption:
Altitude Frame on PFD
Normal (Yellow)
Flashing Amber
Pulsing Yellow

L2 Altitude alerts are inhibited:

- In approach, when the aircraft captures the glideslope, or
- When the landing gear lever is set to DOWN, and the slats are extended, or
- When the landing gear is locked down, or
- When the AP/FD TCAS mode engages upon a Resolution Advisory order.

L3 If an altitude alert is triggered just after the aircraft is clear of conflict, and the AP is engaged, the C chord sound is inhibited.

If an altitude alert is triggered just after the aircraft is clear of conflict, and the AP is not engaged, a C chord sound is generated during 1.5 s.

RA Height

RA HEIGHT

Ident.: DSC-31-CDS-40-20-70-00000796.0001001 / 22 APR 14
Applicable to: ALL

The RA height appears on the PFD when the aircraft height is less than 2 500 ft.

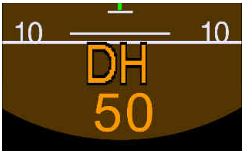
L3 The RA height value changes:
- Every 10 ft above 50 ft
- Every 5 ft between 5 ft and 50 ft
- Every foot below 5 ft.

L1

The aircraft is above:
- The minimum entered in the FMS PERF page +100 ft, or
- 400 ft, if the flight crew did not enter a minimum in the FMS PERF page.

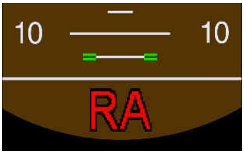
The aircraft is below:
- The minimum entered in the FMS PERF page +100 ft, or
- 400 ft, if the flight crew did not enter a minimum in the FMS PERF page.

L12



Appears above the RA indication, when the aircraft is below the minimum entered in the RADIO field of the FMS PERF page.
Temporarily flashes, then remains steady.
Does not appear when the backup altitude (from FADECs) is manually or automatically selected. For more information, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.

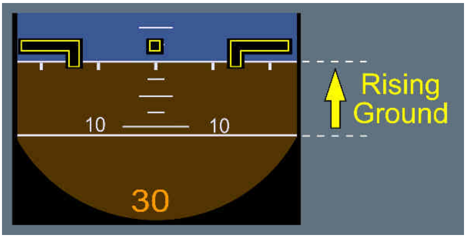
L12



Appears if:
- The three radio altimeters (i.e. RA A, RA B, and RA C) are failed
- The aircraft is below the transition altitude.

Note: *The ground reference indication no longer appears on the altitude scale.*

Temporarily flashes, then remains steady.



When the aircraft approaches the ground, the white line indicates the ground.
This line translates toward the horizon until the aircraft touches down.

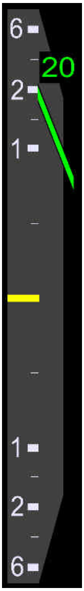
Vertical Speed

VERTICAL SPEED

Ident.: DSC-31-CDS-40-20-80-00000797.0002001 / 18 AUG 17
Applicable to: ALL

L3 The vertical speed information is based on barometric data from the ADRs, and on inertial data from the IRs.

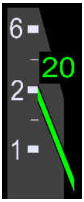
L12



The vertical speed scale has a range between ± 6 000 ft/min.

The scale has markers:
- Every 500 ft/min, between -2 000 ft/min and 2 000 ft/min
- Every 2 000 ft/min:
  - Between -6 000 ft/min and -2 000 ft/min
  - Between 2 000 ft/min and 6 000 ft/min.

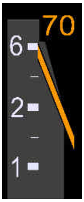
L12



The vertical speed of the aircraft is within the scale.

Note: *The digital indication only appears when the vertical speed:*
- *Exceeds 200 ft/min, or*
- *Is less than -200 ft/min.*

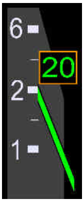
L1



The vertical speed of the aircraft appears in amber if the vertical speed:

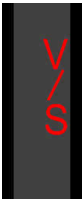
- Exceeds 6 000 ft/min(below -6 000 ft/min), or
- Is less than -2 000 ft/min, and the aircraft RA height is between 1 000 ft and 2 500 ft, or
- Is less than -1 200 ft/min, and the aircraft RA height is below 1 000 ft.

L12



- The vertical speed is based on ADRs data only, and no longer combined with IRs data, or
  There is a time lag between the vertical speed that appears on the PFD, and the actual vertical speed of the aircraft.
- The vertical speed is based on baro inertial data from the backup sources.

L12



The vertical speed information is not available.
Temporarily flashes, then remains steady.

For more information about TCAS indications on the vertical scale, *Refer to DSC-34-SURV-40-20 Vertical Speed Scale*.

Heading/Track

HEADING/TRACK

HEADING/TRACK SCALE

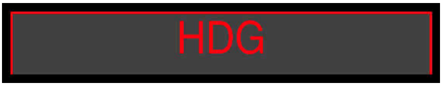
L3 The ADIRS provide the heading information.

L1 Appears on the horizon line, in the MAG or TRUE reference.
Headings are marked every 5 ° with a numeric value every 10 °.

L2 The heading/track scale is in the TRUE reference:
- When the flight crew presses the TRUE/MAG pb, on the AFS CP
- At high latitudes, when the ADIRS automatically change the MAG North reference to the TRUE North reference.

For more information about the polar navigation, *Refer to DSC-22-FMS-10-30-30 Introduction*.

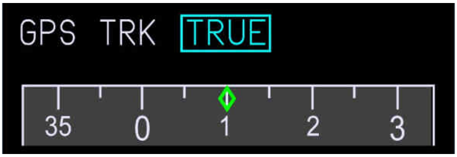
L12



Appears instead of the heading scale if the heading information is not available. Temporarily flashes, then remains steady.

L1 GPS TRK MESSAGE

L12



Appears when the GPS track replaces the heading symbol.
The track symbol is always centered on the scale.
ISIS provide inertial data for the current GPS true track.

Ident.: DSC-31-CDS-40-20-90-10-00000802.0001001 / 22 APR 14

CURRENT HEADING

L3 The ADRs provide the heading value.

L1

Indicates the current heading of the aircraft, on the heading scale.
The heading value refers to true or magnetic North, depending on the MAG/TRUE pb selection.

Ident.: DSC-31-CDS-40-20-90-10-00000803.0001001 / 22 APR 14

CURRENT TRACK

L3 The IRS provides the current track information.

L1

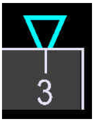
Indicates the current track of the aircraft, on the heading scale.

Ident.: DSC-31-CDS-40-20-90-10-00000804.0001001 / 22 APR 14

SELECTED HEADING(TRACK)

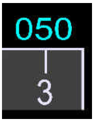
L3 If all three PRIMs are lost, the FCU backup provides the selected heading(track) information. In all other cases, the PRIMs provide the selected heading(track) information.

L12



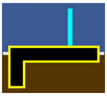
Indicates the heading(track) that the flight crew selected on the AFS CP.
Appears when the HDG/TRACK mode is engaged.

L1



The selected heading(track) is outside the display area. The numeric value appears instead of the symbol on the right(left) side of the heading/track scale.

L12



The heading(track) bar appears on the horizon line of the PFD, when the FDs are off.
The heading scale of the PFD has markers every 10 °.

Ident.: DSC-31-CDS-40-20-90-10-00000805.0001001 / 22 APR 14

TRUE INDICATION

L12

The heading refers to true North.
When the slats extend, temporarily flashes, then remains steady.
When the aircraft approaches high latitudes, the SELECT TRUE NORTH REF message appears on the ND, and requests the flight crew to select the TRUE North reference.

L3 This message appears:
- Above 82 ° North, or
- Above 73 ° North, with a longitude between 120 ° West, and 90 ° West, or
- Below 60 ° South.

L1 To change the North reference, the flight crew can press the TRUE/MAG pb on the AFS CP. When the aircraft reaches high latitudes, the ADIRS automatically changes the MAG North reference to the TRUE North reference.

L3 The aircraft is at high latitudes:
- Above 82.5 ° North, or
- Above 73.5 ° North, with a longitude between 117.5 ° West, and 92.5 ° West, or
- Below 60.5 ° South.

L2 For more information about polar navigation, *Refer to DSC-22-FMS-10-30-30 Introduction*.

Intentionally left blank

Guidance

FD GUIDANCE

Ident.: DSC-31-CDS-40-20-100-00000808.0002001 / 05 NOV 15
Applicable to: ALL

L3 The PRIMs provide the FD guidance information.

L1 When the FDs are engaged, the display conditions of the guidance orders are:
- For lateral guidance orders:
  The yaw bar is displayed during takeoff or landing roll. Otherwise, the roll bar is displayed when a lateral mode is engaged.

L2 The yaw bar only appears in RWY and ROLL OUT.

L1
- For vertical guidance orders:
  The pitch bar is displayed after liftoff when the tail strike pitch limit disappears, and when a vertical mode is engaged.

L2 With the AP on, the pitch bar disappears in ROLL OUT.
With the AP off, the pitch bar disappears below 50 ft RA.

L1 For more information about the FDs, *Refer to DSC-22-FG-30-10 General*.

Indicates that at least one guidance order (i.e. roll, pitch, or yaw) is not valid.
Temporarily flashes, then remains steady.

Departure and Approach Guidance

DEPARTURE AND APPROACH GUIDANCE

Ident.: DSC-31-CDS-40-20-110-00000810.0001001 / 13 MAY 14
Applicable to: ALL

The approach guidance indications on the PFD differ, when the aircraft performs:
- xLS approaches (*Refer to DSC-31-CDS-40-20-110 xLS Approaches*), or
- RNP AR/RNAV(RNP) approaches and RNAV departures (*Refer to DSC-31-CDS-40-20-110 RNP AR/RNAV(RNP) Departures and Approaches*).

For more information about the different approaches included in the xLS and RNP AR/RNAV(RNP) categories, *Refer to PRO-NOR-SOP-180-A Cross-Reference Table*.

XLS APPROACHES

Applicable to: ALL

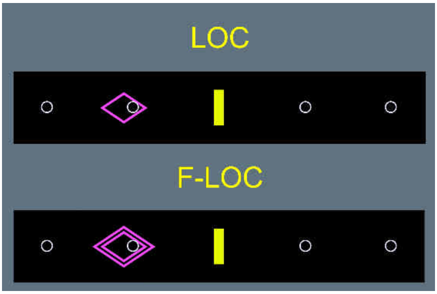
LS Course Pointer

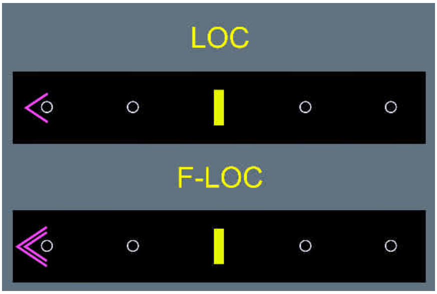
LOC OR F-LOC DEVIATION

L3 The MMR provides the LOC and the F-LOC deviations.

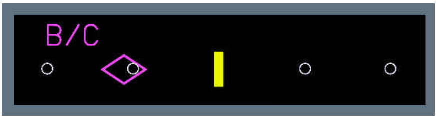
L1



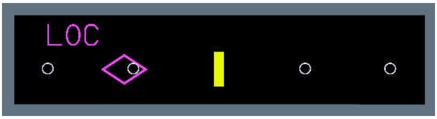
The LOC and F-LOC deviations are within the scale.



The LOC and F-LOC deviations are outside the scale.



The flight crew selected a back beam approach or a LOC back course departure.



The flight crew selected a LOC approach compatible with the FLS function.

If the deviation exceeds a quarter deflection, the deviation scale flashes and the LOC deviation symbol flashes when:
- The aircraft is below 1 000 ft down to 15 ft
- LAND1, LAND2, or LAND3 appears on the FMA
- LOC, LAND, or FLARE is engaged.

L2 For more information about the conditions of excessive deviation, *Refer to DSC-22-FG-100-20 Excessive Deviation Indication*.

L1 If the LOC transmitter fails:
- The LOC indexes disappear on both PFDs
- The LOC scales temporarily flash on both PFDs.

L2 The detection of the LOC transmitter failure is available between 1 000 ft and 15 ft, when the LOC mode is engaged.
For more information about the LS transmitter failure, *Refer to DSC-22-FG-100-20 Failure of the LS Transmitter*.

L12

LOC	Appears instead of the LOC scale, if the LOC deviation is not valid. Temporarily flashes, then remains steady. For more information, *Refer to DSC-22-FG-100-20 Failure of one LS Receiver*.

L123

F-LOC	Appears instead of the F-LOC scale, if the F-LOC deviation is not valid. The F-LOC deviation is not available when the FLS function of the MMR on the same side is lost. Temporarily flashes, then remains steady. For more information, *Refer to DSC-22-FG-100-20 Failure of one LS Receiver*.

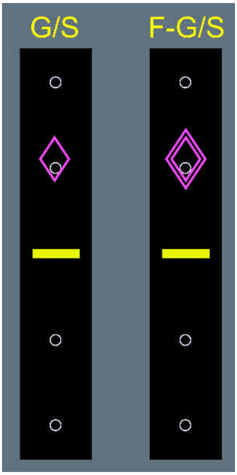
L1 Note: *During a LOC or LOC B/C approach flown with the FLS function, the lateral deviation symbol is a single diamond, as for an ILS approach.*

Ident.: DSC-31-CDS-40-20-110-10-00019060.0001001 / 03 JUL 20

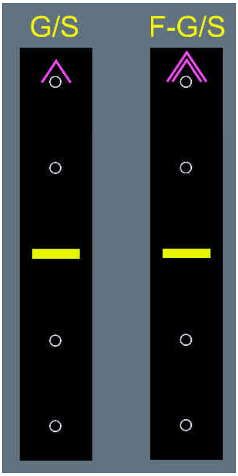
1 G/S OR F-G/S DEVIATION

L3 The MMR provides the G/S and F-G/S deviations.

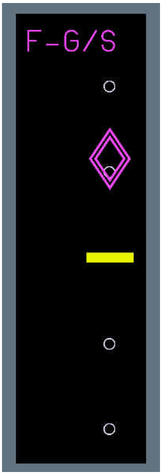
L1



The G/S and F-G/S deviations are within the scale.



The G/S and F-G/S deviations are outside the scale.



The flight crew selected a LOC or LOC B/C approach compatible with the FLS function.

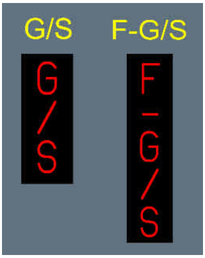
If the deviation is more than one dot, the deviation scale flashes and the G/S deviation symbol flashes when:
- The aircraft is below 1 000 ft down to 100 ft
- LAND1, LAND2, or LAND3 appears on the FMA
- G/S, LAND, or FLARE is engaged.

L2 For more information about the conditions of excessive deviation, *Refer to DSC-22-FG-100-20 Excessive Deviation Indication*.

L1 If the G/S transmitter fails:
- The G/S indexes disappear on both PFDs
- The G/S scales temporarily flash on both PFDs.

L2 The detection of the G/S transmitter failure is available between 1 000 ft and 100 ft, when the G/S mode is engaged.
For more information about the LS transmitter failure, *Refer to DSC-22-FG-100-20 Failure of the LS Transmitter*.

L1



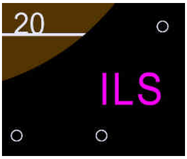
The G/S or F-G/S deviation is not valid.

Ident.: DSC-31-CDS-40-20-110-10-00019903.0002001 / 09 MAR 16

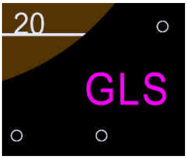
APPROACH TYPE

L3 The MMR and the FMS provide the approach type.

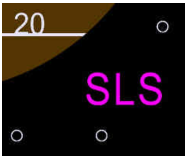
L1



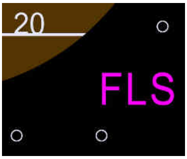
Appears when:
- The flight crew selected an ILS approach
- The LS pb is set to on.



Appears when:
- The flight crew selected an GLS ◁* approach
- The LS pb is set to on.



Appears when:
- The flight crew selected an approach compatible with the SLS ◁* function
- The LS pb is set to on.



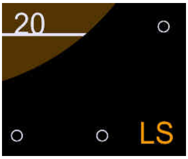
Appears when:
- The flight crew selected an approach compatible with the FLS function
- The LS pb is set to on.

Ident.: DSC-31-CDS-40-20-110-10-00019072.0001001 / 22 APR 14

LS REMINDER

L3 The MMR and the FMS provide the LS reminder information.

L12



Appears if:
- The flight crew selected an xLS approach
- The LS pb is set to off after the approach mode was armed or engaged.

Temporarily flashes, then remains steady.

Ident.: DSC-31-CDS-40-20-110-10-00019061.0002001 / 22 APR 14

LS COURSE POINTER

L3 The MMR and the PRIM provide the LS course pointer information.

L1

Indicates the LOC course of the selected approach, on the heading scale.

Indicates the F-LOC course of the selected approach, on the heading scale.

L2 Appears, when the LS pb is set to on, for more information *Refer to DSC-31-CDS-40-60 LS pb*.

Ident.: DSC-31-CDS-40-20-110-10-00019063.0001001 / 22 APR 14

ILS MARKER

L2 Appears when:
- The flight crew selected an ILS approach
- The LS pb is set to on
- The aircraft flies over a marker beacon.

L1

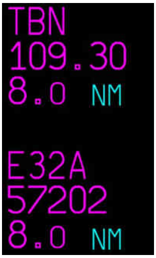
OM	The aircraft is over the outer marker of the ILS approach.
MM	The aircraft is over the middle marker of the ILS approach.
IM	The aircraft is over: - The inner marker of the ILS approach, or - An airway marker.

Ident.: DSC-31-CDS-40-20-110-10-00019065.0001001 / 28 APR 17

LS INFORMATION

L3 The MMR, the DME, and the FMS provide the LS information.

L13



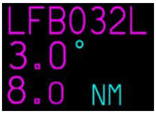
TBN
109.30
8.0 NM

E32A
57202
8.0 NM

Indicates the following information about the ILS, GLS ◁, or an approach compatible with the SLS ◁ function:

- The ILS, GLS, or SLS identification
  The MMR decodes the ILS, GLS, or SLS identification.
- The ILS frequency or the channel of the GLS or the approach compatible with the SLS function
- The DME distance (if any), or the distance to the threshold in the case of a GLS or an approach compatible with the SLS approach.

L13

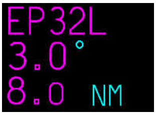


LFB032L
3.0°
8.0 NM

Indicates:

- The FLS anchor point identification, when the anchor point is on the runway threshold
- The FLS beam slope
- The distance to the anchor point.
  The FMS computes this distance.

L13



EP32L
3.0°
8.0 NM

Indicates:

- The end point
  The anchor point is called end point when it is not located on the runway threshold.
- The FLS beam slope
- The distance to the end point.
  The FMS computes this distance.

L12

ILS

Appears during an ILS approach, if one of the following is not available:

- The LOC signal, or
- The G/S signal.

Temporarily flashes, then remains steady.

L12

GLS

Appears during a GLS ◁ approach, if one of the following is not available:

- The computed LOC signal, or
- The computed G/S signal.

Temporarily flashes, then remains steady.

L12	SLS	Appears during an approach compatible with the SLS ◁* function, if one of the following is not available: - The computed LOC signal, or - The computed G/S signal. Temporarily flashes, then remains steady.
L12	FLS	Appears if one of the following is not available: - The FLS function, or - The computed F-LOC signal, or - The computed F-G/S signal, or - The distance to the anchor point. Temporarily flashes, then remains steady.
L12	LOC/FLS	Appears if one of the following is not available: - The FLS function, or - The LOC signal, or - The computed F-G/S signal, or - The distance to the anchor point. Temporarily flashes, then remains steady.
L12	LS	Appears if the MMR sends inconsistent information. Temporarily flashes, then remains steady.
L12	DME	Appears if: - The ILS is paired with a DME - The DME distance is not available. Temporarily flashes, then remains steady.

RNP AR/RNAV(RNP) DEPARTURES AND APPROACHES

Applicable to: ALL

Ident.: DSC-31-CDS-40-20-110-20-00019056.0001001 / 22 APR 14

To perform an RNAV(RNP) departure, the flight crew must:
- Select an RNAV(RNP) departure on the FMS DEPARTURE page
- Set the LS pb to off on the EFIS CP.

To perform an RNP AR/RNAV(RNP) approach, the flight crew must:
- Select an RNP AR/RNAV(RNP) approach on the FMS ARRIVAL page
- Set the APPR pb to on
- Set the LS pb to off on the EFIS CP.

Note: *The display enables to perform the RNAV(RNP) missed approach procedure associated with the RNP AR/RNAV(RNP) approach.*

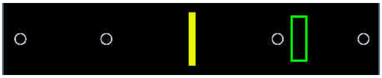
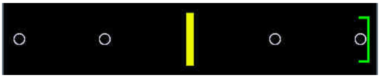
2 LATERAL DEVIATION

L3 The FMS provides the lateral deviation (LDEV).

L1 Indicates the deviation relative to the lateral F-PLN profile.



The LDEV is within the scale.



The LDEV is outside the scale.

One dot on the lateral deviation scale corresponds to a deviation of 0.1 NM.

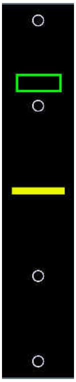
L2 During approach, the LDEV scale and index flash when the FMS detects an excessive deviation that exceeds 1 x RNP of the current leg. There is no LDEV and index flash on departure or go-around.

Ident.: DSC-31-CDS-40-20-110-20-00019085.0001001 / 03 JUL 20

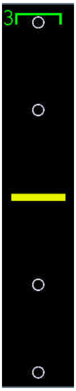
3 VERTICAL DEVIATION

L3 The FMS provides the vertical deviation (VDEV).

L1 Indicates the deviation relative to the vertical F-PLN profile.



The VDEV is within the scale.



The VDEV is outside the scale.
The value of the deviation is written aside the deviation symbol. In this case, the aircraft is 300 ft below the vertical profile.

One dot on the vertical deviation scale corresponds to a deviation of 100 ft.

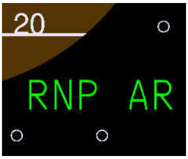
L2 The VDEV scale and index flash when the FMS detects an excessive deviation of 3/4 dot (75 ft) below the vertical profile.

Ident.: DSC-31-CDS-40-20-110-20-00019200.0001001 / 22 APR 14

DEPARTURE/APPROACH TYPE

L3 The FMS provides the RNP AR/RNAV(RNP) reminder information.

L1



Appears when:
- The flight crew selected an RNAV(RNP) departure or an RNP AR/RNAV(RNP) approach
- The LS pb is set to off.

DISPLAY MESSAGES

L12

CHECK ATT	Attitude data displayed on the two PFDs differ by more than 5 ° in pitch or roll. Temporarily flashes, then remains steady. For more information about the warning and the procedure associated with the CHECK ATT message, *Refer to PRO-ABN-NAV NAV CAPT & F/O ATT DISAGREE*

L12

CHECK CAPT(F/O) INR DU	The CDS detects erroneous data displayed on the CAPT(F/O) inner DU. Temporarily flashes, then remains steady.

L12

CHECK CAPT(F/O) OUTR DU	The CDS detects erroneous data displayed on the CAPT(F/O) outer DU. Temporarily flashes, then remains steady.

L12

CHECK CTR LWR DU	The CDS detects erroneous data on the center lower DU. Temporarily flashes, then remains steady.

L12

CHECK CTR LWR DU & F/O HUD	The CDS detects a discrepancy between the data displayed on the center lower DU and the F/O HUD. Temporarily flashes, then remains steady.

L12

CHECK CTR UPPR DU	The CDS detects erroneous data displayed on the center upper DU. Temporarily flashes, then remains steady.

L12

CHECK CTR UPPR DU & CAPT HUD	The CDS detects a discrepancy between the data displayed on the center upper DU and the data displayed on the CAPT HUD. Temporarily flashes, then remains steady.

L12

CHECK HDG	The CDS detects a discrepancy between the heading parameters of the CAPT EFIS and the F/O EFIS. Appears on the heading scale of the PFD. The CDS detects a discrepancy, if the difference between the two headings exceeds: - 5 ° in TRUE reference - 7 ° in MAG reference. Temporarily flashes, then remains steady. For more information about the warning and the procedure associated with the CHECK HDG message, *Refer to PRO-ABN-NAV NAV CAPT & F/O HDG DISAGREE*.

L12

DISPLAY SYSTEM VERSIONS DISAGREE	Appears if: - The aircraft is on ground, before engine start or after landing - The software of the display units are different. Temporarily flashes, then remains steady.

Overview

OVERVIEW

Ident.: DSC-31-CDS-40-40-10-00000823.0001001 / 09 MAR 16
Applicable to: ALL

The Navigation Display (ND) provides the flight crew with lateral navigation data, relative to:
- The flight plan
- The navigation database data (waypoints, navaids, and airports).

The flight crew can change some items of the flight plan directly from the ND. For more information about the ND interactivity, *Refer to DSC-31-CDS-40-40-100 Interactive ND Overview*.

The ND also displays:
- Data from the weather radar, the terrain profile, or information about traffic collision avoidance
- Data from the Airport Navigation Function (ANF). For more information about the ANF, *Refer to DSC-34-NAV-80-10 General*.

For navigation purposes, the flight crew can select one of the following ND modes:
- ARC
  For more information, *Refer to DSC-31-CDS-40-40-20 ARC Mode Overview*.
- PLAN
  L2 In PLAN mode, it is not possible to display data from the weather radar, the terrain profile, or traffic collision avoidance.
  L1 For more information, *Refer to DSC-31-CDS-40-40-30 PLAN Mode Overview*.
- ROSE-NAV
  For more information, *Refer to DSC-31-CDS-40-40-40 ROSE-NAV Mode Overview*.
- ROSE-VOR
  For more information, *Refer to DSC-31-CDS-40-40-50 ROSE-VOR Mode Overview*.
- ROSE-LS.
  For mode information, *Refer to DSC-31-CDS-40-40-60 ROSE-LS Mode Overview*.

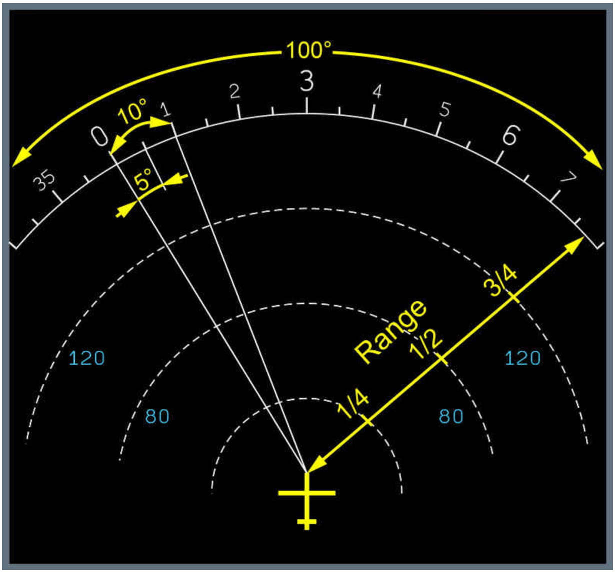
HEADING SCALE

The heading scale is an arc of a circle of 100 °. Headings are marked every 5 °, with a numerical value every 10 °.
The radius of the heading scale corresponds to the range that the flight crew selected on the EFIS CP.
Dotted arcs are drawn at a quarter, a half, and three quarters of the selected range.
Range values are displayed at three quarters and at a half of the selected range.
For more information about the ND range selection, *Refer to DSC-31-CDS-40-60 ND Range Sel*.



The TCAS arc corresponds to a distance of 2.5 NM, and appears when:
- The selected range is less than, or equal to, 20 NM
- The flight crew presses the TRAF pb on the EFIS CP, or a TCAS alert is triggered.

80

Ident.: DSC-31-CDS-40-40-20-10-00000826.0001001 / 22 APR 14

HEADING REFERENCE

L3 The ADIRS provides the heading value.

L1

Indicates the current aircraft heading on the heading scale.
The heading refers to true North or magnetic North, depending on the MAG/TRUE pb selection on the AFS CP.

Ident.: DSC-31-CDS-40-40-20-10-00000827.0001001 / 22 APR 14

CURRENT TRACK

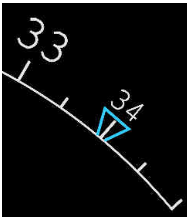
L3 The ADIRS provides the aircraft track.

L1

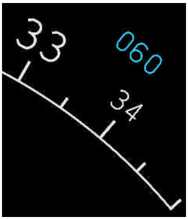
Indicates the current aircraft track on the heading scale.
The track refers to true North or magnetic North, depending on the MAG/TRUE pb selection on the AFS CP.

Ident.: DSC-31-CDS-40-40-20-10-00000828.0001001 / 22 APR 14

SELECTED HEADING(TRACK)



Indicates the heading(track) that the flight crew selects on the AFS CP.
Appears when the HDG(TRACK) mode is engaged.



When the flight crew selects a heading(track) outside the arc scale, a numerical value appears instead of the heading bug.
Appears when the HDG(TRACK) mode is engaged.

Ident.: DSC-31-CDS-40-40-20-10-00000829.0001001 / 22 APR 14

LS COURSE POINTER

L3 The MMR and the PRIM provide the LS course pointer information.

L1

Indicates the LOC course of the selected approach, on the heading scale.

Indicates the F-LOC course of the selected approach, on the heading scale.

L2 Appears, when the LS pb is set to on, for more information *Refer to DSC-31-CDS-40-60 LS pb*.

Ident.: DSC-31-CDS-40-40-20-10-00000830.0002001 / 03 JUL 20

1 VOR POINTERS

Indicates the bearing of the selected VOR1.
Appears when the flight crew presses the VOR1 pb on the EFIS CP.

Indicates the bearing of the selected VOR2 ◁ .
Appears when the flight crew presses the VOR2 pb ◁ on the EFIS CP.

L3 If the VOR North reference stored in the FMS database is different from the current aircraft North reference, the VOR pointer appears in magenta, and is not corrected for magnetic variation.

Ident.: DSC-31-CDS-40-40-20-10-00019203.0002001 / 09 MAR 16

ADF POINTERS ◁

Indicates the bearing of the selected NDB1 ◁ .
Appears when the flight crew presses two times the VOR1/ADF1 pb ◁ on the EFIS CP.

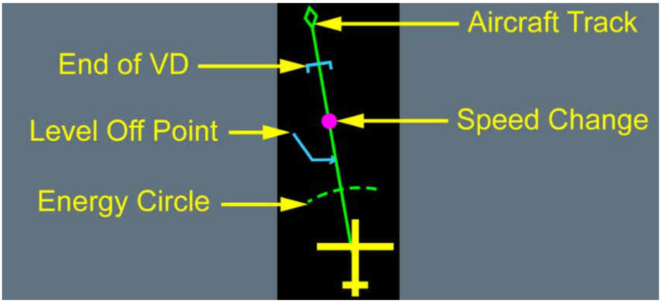
Indicates the bearing of the selected NDB2 ◁ .
Appears when the flight crew presses two times the VOR2 ◁ /ADF2 pb ◁ on the EFIS CP.

Ident.: DSC-31-CDS-40-40-20-10-00000832.0001001 / 22 APR 14

TRACK LINE

The track line and associated symbols appear on the ND.
The track line corresponds to the predicted track of the aircraft.

Track Line



ENERGY CIRCLE

L3 The FMS provides the energy circle.

L12

Indicates the minimum distance required to descend, decelerate, and land at the destination airport elevation.
Appears on the ND, when in HDG(TRACK) mode.
Appears when the aircraft is within 180 NM of the destination airport, in cruise, descent, or approach.

L1 SPEED CHANGE

L3 The FMS provides the location of the speed change.

L1

Indicates the point at which the flight crew must change the aircraft speed, in order to comply with a speed target.
Appears on the ND, when in HDG(TRACK) mode.

LEVEL OFF POINT

The aircraft is in descent.
Indicates the point at which the aircraft will reach the altitude target that is selected on the AFS CP.
Appears on the ND, when in HDG(TRACK) mode.

The aircraft is in climb.
Indicates the point at which the aircraft will reach the altitude target that is selected on the AFS CP.
Appears on the ND, when in HDG(TRACK) mode.

END OF VD

Indicates the end of the VD on the aircraft track line.
Appears on the ND, when in HDG(TRACK) mode.
The VD range is limited to 160 NM. Therefore, in ARC mode, the end of VD symbol appears on the track line when the ND range is more than 160 NM.
For more information, *Refer to DSC-31-CDS-40-50 Range*.

Ident.: DSC-31-CDS-40-40-20-10-00000833.0001001 / 22 APR 14

AZIMUTH LINE

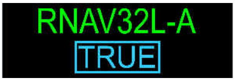
A white line indicates the azimuth that is used for the computation of the vertical cut of the VD. For more information, *Refer to DSC-31-CDS-40-50 VD*.
The flight crew can select the VD AZIM mode via the VD AZIM knob, on the SURV panel. For more information, *Refer to DSC-34-SURV-30-20 VD AZIM Knob*.

Indicates the end of the VD on the azimuth line.
The VD range is limited to 160 NM. Therefore, in ARC mode, the end of VD symbol appears on the azimuth line when the ND range is more than 160 NM.

Ident.: DSC-31-CDS-40-40-20-10-00000834.0001001 / 22 APR 14

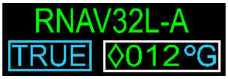
TRUE INDICATION

L12



The heading refers to true North, and the latitude of the aircraft is less than 65 ° North or South.
When the slats extend, the TRUE message temporarily flashes, then remains steady.

L12



The heading refers to true North, and the latitude of the aircraft is strictly more than 65 ° North or South.
The grid track indicates the true track of the aircraft.
When the slats extend, the TRUE message temporarily flashes, then remains steady.

When the aircraft approaches high latitudes, the SELECT TRUE NORTH REF message requests the flight crew to manually select the TRUE North reference.

L3 This message appears:
- Above 82 ° North, or
- Above 73 ° North, with a longitude between 120 ° West, and 90 ° West, or
- Below 60 ° South.

L1 To change the North reference, the flight crew can press the TRUE/MAG pb on the AFS CP.

When the aircraft reaches high latitudes, the ADIRS automatically changes the MAG North reference to the TRUE North reference.

L3 The aircraft is at high latitudes:
- Above 82.5 ° North, or
- Above 73.5 ° North, with a longitude between 117.5 ° West, and 92.5 ° West, or
- Below 60.5 ° South.

L1 *Note:* *The BTV also displays messages in the same area, and has priority over the TRUE indication. When a BTV message is displayed, the TRUE indication appears under the TAS indication, on the third line. For more information about BTV messages, Refer to DSC-34-32-30-20-60 ND.*

L2 For more information about polar navigation, *Refer to DSC-22-FMS-10-30-30 Introduction*.

PLAN Mode

PLAN MODE

Applicable to: ALL

Ident.: DSC-31-CDS-40-40-30-10-00000835.0001001 / 22 APR 14

The PLAN mode shows the flight plan route on a fixed map oriented with North at the top.

L2 Raw navigation station data is not available in this mode.

L1 In PLAN mode, the flight crew can scroll through and display the entire flight plan.

PLAN Mode Overview

Map

Ident.: DSC-31-CDS-40-40-30-10-00000836.0001001 / 22 APR 14

MAP

The map is aligned with true North. The map is centered on the Map Reference Point (MRP), that the flight crew selects on the MFD.

Ident.: DSC-31-CDS-40-40-30-10-00000837.0001001 / 22 APR 14

RANGE

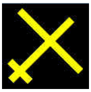
The diameter of the outer circle corresponds to the range that the flight crew selects on the EFIS CP.
Range values are displayed at a quarter and at a half of the selected range.

Ident.: DSC-31-CDS-40-40-30-10-00000838.0001001 / 22 APR 14

AIRCRAFT SYMBOL

L3 The FMS provides the aircraft position, and the ADIRS provides the aircraft heading.

L1



Indicates the aircraft position in relation to the flight plan. The aircraft symbol orientation indicates the aircraft heading with reference to true North.

Ident.: DSC-31-CDS-40-40-30-10-00000839.0001001 / 22 APR 14

MAP REFERENCE POINT

In PLAN mode, the map is centered on the Map Reference Point (MRP) that corresponds to:
- The waypoint displayed on the second line of the flight plan, when the MFD displays a flight plan page (if a pseudo waypoint is displayed on the second line of the flight plan, the MRP is the next waypoint), or
- The TO waypoint of the active flight plan or of any secondary flight plan, when the MFD does not display a flight plan page, or
- The current aircraft position, when there is no waypoint in the flight plan.

ROSE-NAV Mode

ROSE-NAV MODE

Applicable to: ALL

Ident.: DSC-31-CDS-40-40-40-10-00000840.0001001 / 09 MAR 16

The ROSE-NAV mode provides the same information as the ARC mode, but on a full rose display. The rose rotates around the aircraft symbol so that the aircraft heading remains at the top.

L2 If the ND mode or the ND range is not valid, the ND displays the ROSE-NAV mode by default, with a range of 80 NM.

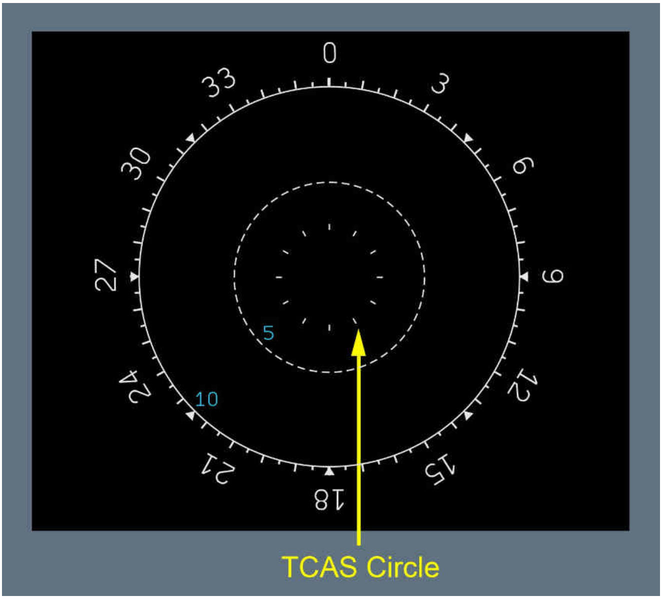
HEADING SCALE

The heading scale corresponds to a full rose of 360 °. Headings are marked every 5 °, with a numerical value every 30 °.
The diameter of the heading scale corresponds to the range that the flight crew selects on the EFIS CP.
A dotted circle is drawn at a half of the selected range.
Range values are displayed at a quarter and at a half of the selected range.

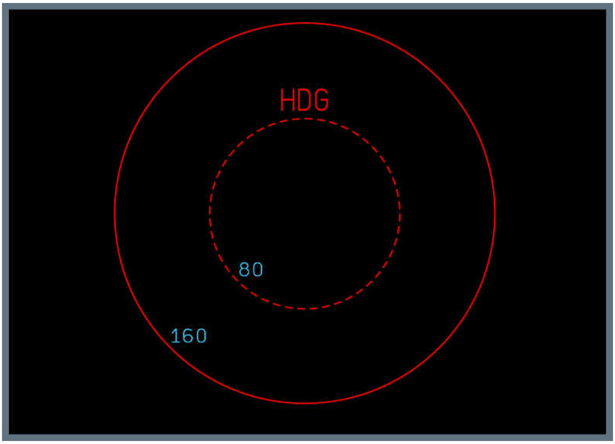
The TCAS circle corresponds to 2.5 NM, and appears when:
- The selected range is less than, or equal to, 20 NM
- The flight crew presses the TRAF pb on the EFIS CP, or a TCAS alert is triggered.

TCAS Circle



L2 When the aircraft heading is not valid, the ND displays the heading scale in red.

Heading Scale Not Valid



Ident.: DSC-31-CDS-40-40-40-10-00000844.0001001 / 22 APR 14

HEADING REFERENCE

L3 The ADIRS provides the heading value.

L1 
Indicates the current aircraft heading on the heading scale.
The heading refers to true North or magnetic North, depending on the MAG/TRUE pb selection on the AFS CP.

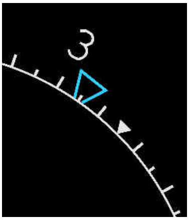
CURRENT TRACK

L3 The ADIRS provides the aircraft track.

L1 
Indicates the current aircraft track on the heading scale.
The track refers to true North or magnetic North, depending on the MAG/TRUE pb selection on the AFS CP.

Ident.: DSC-31-CDS-40-40-40-10-00000846.0001001 / 22 APR 14

SELECTED HEADING(TRACK)



Indicates the heading(track) that the flight crew selects on the AFS CP.
Appears when the HDG(TRACK) mode is engaged.

Ident.: DSC-31-CDS-40-40-40-10-00000847.0001001 / 22 APR 14

LS COURSE POINTER

L3 The MMR and the PRIM provide the LS course pointer information.

L1

Indicates the LOC course of the selected approach, on the heading scale.

Indicates the F-LOC course of the selected approach, on the heading scale.

L2 Appears, when the LS pb is set to on, for more information *Refer to DSC-31-CDS-40-60 LS pb*.

Ident.: DSC-31-CDS-40-40-40-10-00000848.0002001 / 03 JUL 20

1 VOR POINTERS

Indicates the bearing of the selected VOR1.
Appears when the flight crew presses the VOR1 pb on the EFIS CP.

Indicates the bearing of the selected VOR2 ◁ .
Appears when the flight crew presses the VOR2 pb ◁ on the EFIS CP.

L3 If the VOR North reference stored in the FMS database is different from the current aircraft North reference, the VOR pointer appears in magenta, and is not corrected for magnetic variation.

Ident.: DSC-31-CDS-40-40-40-10-00019204.0002001 / 09 MAR 16

ADF POINTERS ◁

Indicates the bearing of the selected NDB1 ◁ .
Appears when the flight crew presses two times the VOR1/ADF1 ◁ pb on the EFIS CP.

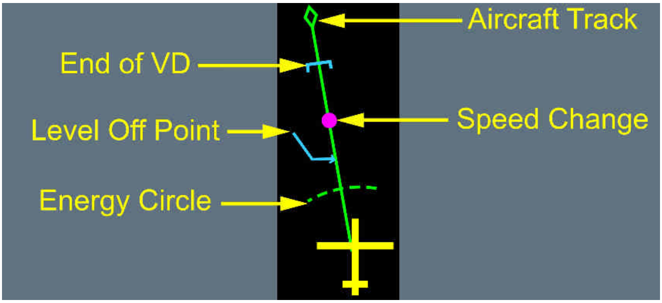
Indicates the bearing of the selected NDB2 ◁ .
Appears when the flight crew presses two times the VOR2 ◁ / ADF2 pb ◁ on the EFIS CP.

Ident.: DSC-31-CDS-40-40-40-10-00000851.0001001 / 22 APR 14

TRACK LINE

The track line and associated symbols appear on the ND.
The track line corresponds to the predicted track of the aircraft.

Track Line



ENERGY CIRCLE

L3 The FMS provides the energy circle.

L12

Indicates the minimum distance required to descend, decelerate, and land at the destination airport elevation.
Appears on the ND, when in HDG(TRACK) mode.
Appears when the aircraft is within 180 NM of the destination airport, in cruise, descent, or approach.

L1 SPEED CHANGE

L3 The FMS provides the location of the speed change.

L1

Indicates the point at which the flight crew must change the aircraft speed, in order to comply with a speed target.
Appears on the ND, when in HDG(TRACK) mode.

LEVEL OFF POINT

The aircraft is in descent.
Indicates the point at which the aircraft will reach the altitude target that is selected on the AFS CP.
Appears on the ND, when in HDG(TRACK) mode.

The aircraft is in climb.
Indicates the point at which the aircraft will reach the altitude target that is selected on the AFS CP.
Appears on the ND, when in HDG(TRACK) mode.

END OF VD

Indicates the end of the VD on the aircraft track line.
Appears on the ND, when in HDG(TRACK) mode.
The VD range is limited to 160 NM. Thus, in ROSE-NAV mode, the End of VD symbol appears on the track line when the ND range is more than 320 NM.
For more information, *Refer to DSC-31-CDS-40-50 Range*.

Ident.: DSC-31-CDS-40-40-40-10-00000850.0001001 / 22 APR 14

AZIMUTH LINE

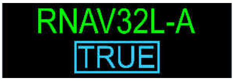
A white line indicates the azimuth that is used for the computation of the vertical cut of the VD. For more information, *Refer to DSC-31-CDS-40-50 VD*.
The flight crew can manually select the VD AZIM mode via the VD AZIM knob, on the SURV panel. For more information, *Refer to DSC-34-SURV-30-10 Manual Azimuth Mode*.

Indicates the end of the VD on the azimuth line.
The VD range is limited to 160 NM. Therefore, in ROSE-NAV mode, the end of VD symbol appears on the azimuth line when the ND range is more than 320 NM.

Ident.: DSC-31-CDS-40-40-40-10-00000852.0001001 / 22 APR 14

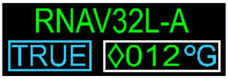
TRUE INDICATION

L12



The heading refers to true North, and the latitude of the aircraft is less than 65 ° North or South.
When the slats extend, the TRUE message temporarily flashes, then remains steady.

L12



The heading refers to true North, and the latitude of the aircraft is strictly more than 65 ° North or South.
The grid track indicates the true track of the aircraft.
When the slats extend, the TRUE message temporarily flashes, then remains steady.
When the aircraft approaches high latitudes, the SELECT TRUE NORTH REF message requests the flight crew to manually select the TRUE North reference.

L3 This message appears:
- Above 82 ° North, or
- Above 73 ° North, with a longitude between 120 ° West, and 90 ° West, or
- Below 60 ° South.

L1 To change the North reference, the flight crew can press the TRUE/MAG pb on the AFS CP. When the aircraft reaches high latitudes, the ADIRS automatically changes the MAG North reference to the TRUE North reference.

L3 The aircraft is at high latitudes:
- Above 82.5 ° North, or
- Above 73.5 ° North, with a longitude between 117.5 ° West, and 92.5 ° West, or
- Below 60.5 ° South.

L1 Note: *The BTV also displays messages in the same area, and has priority over the TRUE indication. When a BTV message is displayed, the TRUE indication appears under the TAS indication, on the third line. For more information about BTV messages, Refer to DSC-34-32-30-20-60 ND.*

L2 For more information about polar navigation, *Refer to DSC-22-FMS-10-30-30 Introduction*.

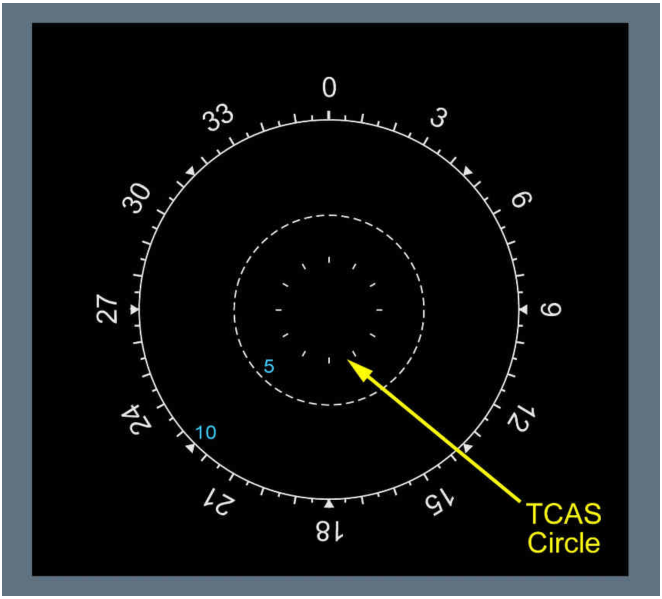
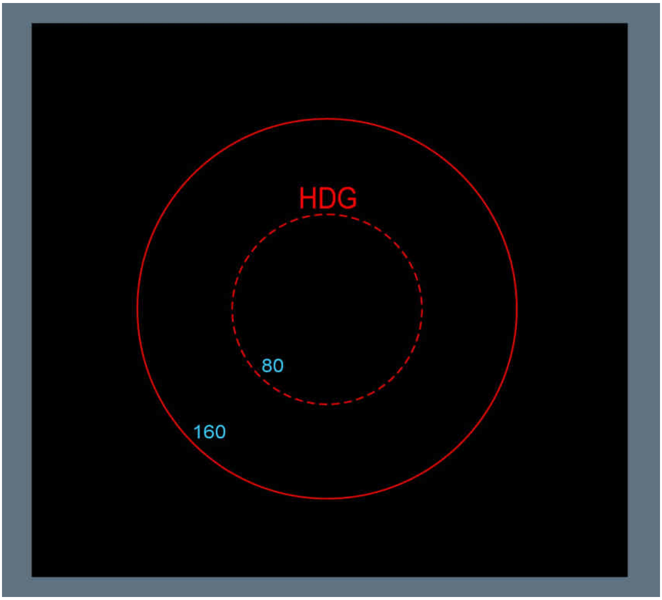
- The selected range is less than, or equal to, 20 NM
- The flight crew presses the TRAF pb on the EFIS CP, or a TCAS alert is triggered.

TCAS Circle



L2 When the aircraft heading is not valid, the ND displays the heading scale in red.

Heading Scale Not Valid



Ident.: DSC-31-CDS-40-40-50-10-00000855.0001001 / 22 APR 14

HEADING REFERENCE

L3 The ADIRS provides the heading value.

L1 
Indicates the current aircraft heading on the heading scale.
The heading refers to true North or magnetic North, depending on the MAG/TRUE pb selection on the AFS CP.

Ident.: DSC-31-CDS-40-40-50-10-00000856.0001001 / 22 APR 14

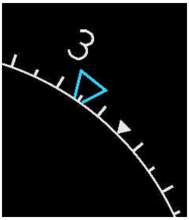
CURRENT TRACK

L3 The ADIRS provides the aircraft track.

L1 
Indicates the current aircraft track on the heading scale.
The track refers to true North or magnetic North, depending on the MAG/TRUE pb selection on the AFS CP.

Ident.: DSC-31-CDS-40-40-50-10-00000857.0001001 / 22 APR 14

SELECTED HEADING(TRACK)



Indicates the heading(track) that the flight crew selects on the AFS CP.
Appears when the HDG(TRACK) mode is engaged.

Ident.: DSC-31-CDS-40-40-50-10-00000858.0002001 / 03 JUL 20

1 ## VOR POINTERS

Indicates the bearing of the selected VOR1.
Appears when the flight crew presses the VOR1 pb on the EFIS CP.

Indicates the bearing of the selected VOR2 ◁ .
Appears when the flight crew presses the VOR2 pb ◁ on the EFIS CP.

L3 If the VOR North reference stored in the FMS database is different from the current aircraft North reference, the VOR pointer appears in magenta, and is not corrected for magnetic variation.

Ident.: DSC-31-CDS-40-40-50-10-00019205.0002001 / 09 MAR 16

ADF POINTERS ◁

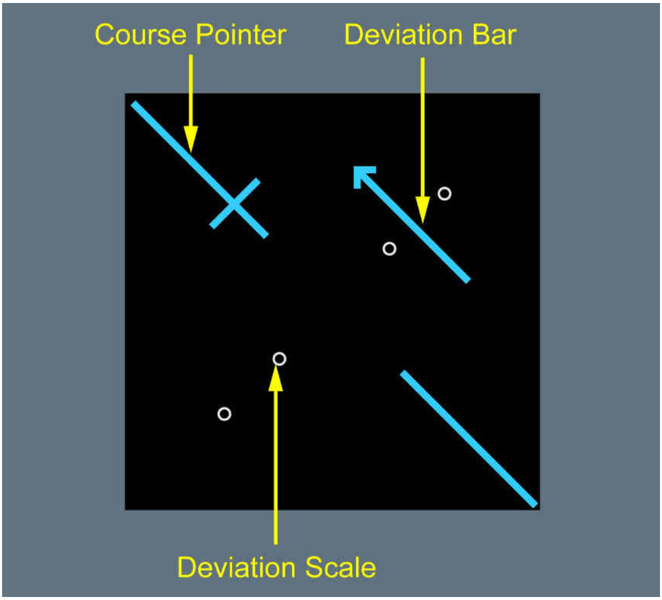
Indicates the bearing of the selected NDB1 ◁ .
Appears when the flight crew presses two times the VOR1/ADF1 ◁ pb on the EFIS CP.

Indicates the bearing of the selected NDB2 ◁ .
Appears when the flight crew presses two times the VOR2 ◁ /ADF2 pb ◁ on the EFIS CP.

Ident.: DSC-31-CDS-40-40-50-10-00000860.0001001 / 22 APR 14

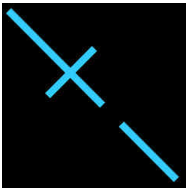
VOR DEVIATION

VOR Deviation



COURSE POINTER

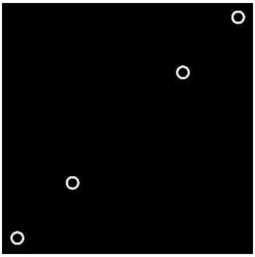
L12



Indicates the VOR course set in the POSITION/NAVAIDS page of the FMS.
For more information about the tuning of navaids via the FMS, *Refer to DSC-22-FMS-20-20-20 POSITION/NAVAIDS Page*.
If the VOR course or the aircraft heading is not valid, the course pointer remains vertical.

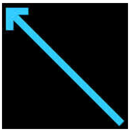
DEVIATION SCALE

L12



The deviation scale has 4 dots. The maximum deviation is 10 ° either side.
The scale flashes if the VOR deviation becomes excessive.

DEVIATION BAR



Indicates the aircraft deviation in relation to the selected VOR course.
The arrow on the deviation bar corresponds to the TO/FROM indication.

VOR FLAG

L12

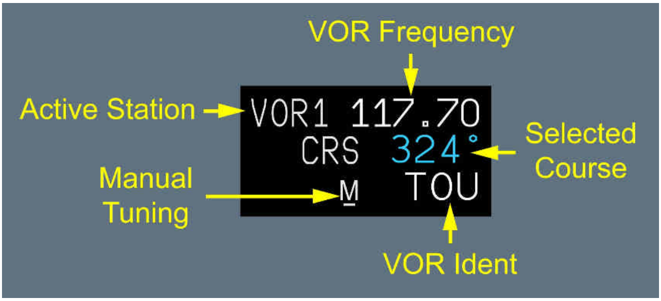
VOR	The VOR bearing is not valid. Temporarily flashes, then remains steady.

Ident.: DSC-31-CDS-40-40-50-10-00000861.0002001 / 09 MAR 16

VOR STATION

The ND displays the characteristics of the selected VOR station. For more information about the tuning of navaids via the FMS, *Refer to DSC-22-FMS-20-20-20 POSITION/NAVAIDS Page*.

VOR Station



VOR Frequency
Active Station
VOR1 117.70
CRS 324°
M TOU
Selected Course
Manual Tuning
VOR Ident

ACTIVE STATION

VOR1	Indicates the VOR receiver currently displayed on the ND. The CAPT ND displays the VOR1 and the F/O ND displays the VOR2 ◁✻ .
VOR1	The VOR bearing is not valid.

VOR FREQUENCY

117.70	Indicates the frequency of the selected VOR in MHz.
---.--	The VOR frequency is not valid.

SELECTED COURSE

CRS 324°	Indicates the selected course in degrees.
CRS XX°	The selected course is not valid.
CRS ---°	The course is not computed.

VOR IDENT

TOU	Indicates the VOR ident.

MANUAL TUNING

R	The flight crew manually tuned the NAVAID via the RMP.
M	The flight crew manually tuned the NAVAID via the MFD.

Ident.: DSC-31-CDS-40-40-50-10-00000862.0001001 / 22 APR 14

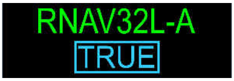
AZIMUTH LINE

A white line indicates the azimuth that is used for the computation of the vertical cut of the VD. For more information, *Refer to DSC-31-CDS-40-50 VD*.
The flight crew can manually select the VD AZIM mode via the VD AZIM knob, on the SURV panel. For more information, *Refer to DSC-34-SURV-30-10 Manual Azimuth Mode*.

Ident.: DSC-31-CDS-40-40-50-10-00000863.0001001 / 22 APR 14

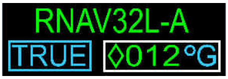
TRUE INDICATION

L12



The heading refers to true North, and the latitude of the aircraft is less than 65 ° North or South.
When the slats extend, the TRUE message temporarily flashes, then remains steady.

L12



The heading refers to true North, and the latitude of the aircraft is strictly more than 65 ° North or South.
The grid track indicates the true track of the aircraft.
When the slats extend, the TRUE message temporarily flashes, then remains steady.

When the aircraft approaches high latitudes, the SELECT TRUE NORTH REF message requests the flight crew to manually select the TRUE North reference.

L3 This message appears:
- Above 82 ° North, or
- Above 73 ° North, with a longitude between 120 ° West, and 90 ° West, or
- Below 60 ° South.

L1 To change the North reference, the flight crew can press the TRUE/MAG pb on the AFS CP. When the aircraft reaches high latitudes, the ADIRS automatically changes the MAG North reference to the TRUE North reference.

L3 The aircraft is at high latitudes:
- Above 82.5 ° North, or
- Above 73.5 ° North, with a longitude between 117.5 ° West, and 92.5 ° West, or
- Below 60.5 ° South.

L1 *Note:* *The BTV also displays messages in the same area, and has priority over the TRUE indication. When a BTV message is displayed, the TRUE indication appears under the TAS indication, on the third line. For more information about BTV messages, Refer to DSC-34-32-30-20-60 ND.*

L2 For more information about polar navigation, *Refer to DSC-22-FMS-10-30-30 Introduction*.

ROSE-LS Mode

ROSE-LS MODE

Applicable to: ALL

Ident.: DSC-31-CDS-40-40-60-10-00000864.0001001 / 09 MAR 16

The ROSE-LS mode shows the position of the aircraft in relation to the LOC, F-LOC, G/S, and F-G/S indications.
The rose rotates around the aircraft symbol so that the aircraft heading remains at the top.

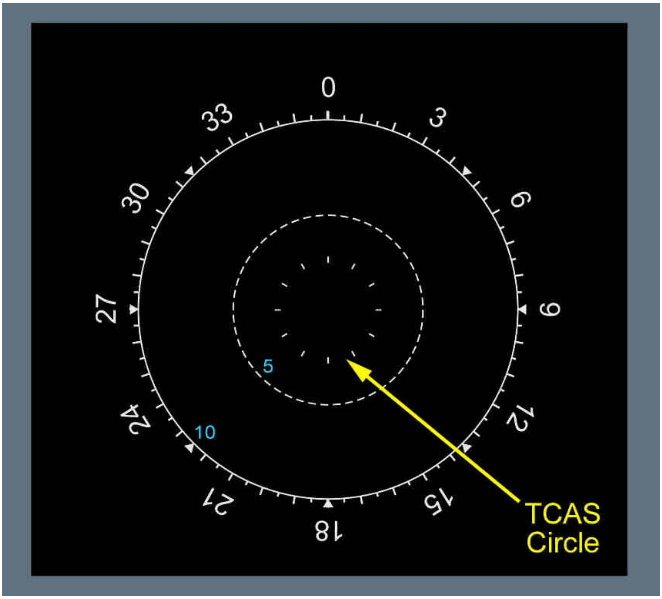
HEADING SCALE

The heading scale corresponds to a full rose of 360 °. Headings are marked every 5 °, with a numerical value every 30 °.
The diameter of the heading scale corresponds to the range that the flight crew selects on the EFIS CP.
A dotted circle is drawn at a half of the selected range.
Range values are displayed at a quarter and at a half of the selected range.

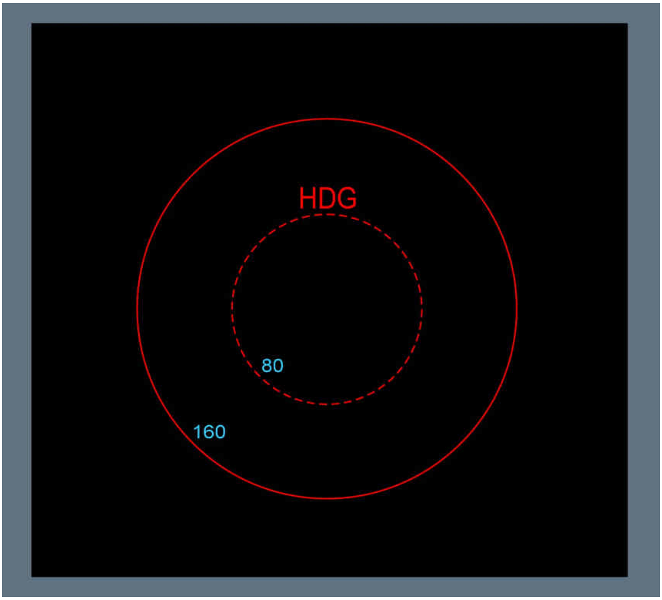
The TCAS circle corresponds to 2.5 NM, and appears when:
- The selected range is less than, or equal to, 20 NM
- The flight crew presses the TRAF pb on the EFIS CP, or a TCAS alert is triggered.

TCAS Circle



L2 When the aircraft heading is not valid, the ND displays the heading scale in red.

Heading Scale Not Valid



Ident.: DSC-31-CDS-40-40-60-10-00000866.0001001 / 22 APR 14

HEADING REFERENCE

L3 The ADIRS provides the heading value.

L1

Indicates the current aircraft heading on the heading scale.
The heading refers to true North or magnetic North, depending on the MAG/TRUE pb selection on the AFS CP.

Ident.: DSC-31-CDS-40-40-60-10-00000867.0001001 / 22 APR 14

CURRENT TRACK

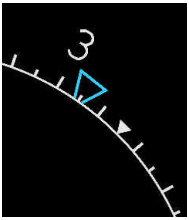
L3 The ADIRS provides the aircraft track.

L1

Indicates the current aircraft track on the heading scale.
The track refers to true North or magnetic North, depending on the MAG/TRUE pb selection on the AFS CP.

Ident.: DSC-31-CDS-40-40-60-10-00000868.0001001 / 22 APR 14

SELECTED HEADING(TRACK)



Indicates the heading(track) that the flight crew selects on the AFS CP.
Appears when the HDG(TRACK) mode is engaged.

Ident.: DSC-31-CDS-40-40-60-10-00000869.0002001 / 03 JUL 20

1 ## VOR POINTERS

Indicates the bearing of the selected VOR1.
Appears when the flight crew presses the VOR1 pb on the EFIS CP.

Indicates the bearing of the selected VOR2 ◁ .
Appears when the flight crew presses the VOR2 pb ◁ on the EFIS CP.

L3 If the VOR North reference stored in the FMS database is different from the current aircraft North reference, the VOR pointer appears in magenta, and is not corrected for magnetic variation.

Ident.: DSC-31-CDS-40-40-60-10-00019206.0002001 / 09 MAR 16

ADF POINTERS ◁

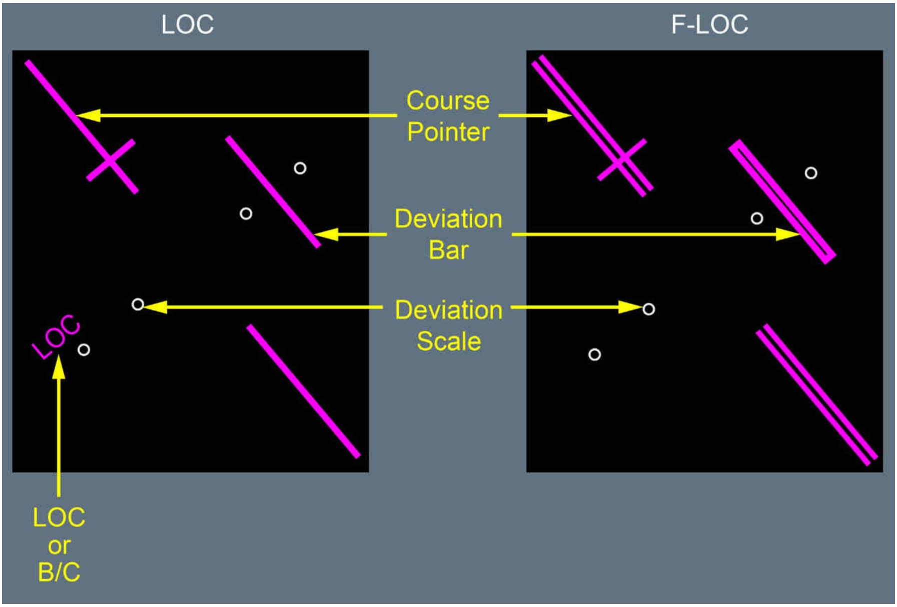
Indicates the bearing of the selected NDB1 ◁ .
Appears when the flight crew presses two times the VOR1/ADF1 ◁ pb on the EFIS CP.

Indicates the bearing of the selected NDB2 ◁ .
Appears when the flight crew presses two times the VOR2 ◁ /ADF2 pb ◁ on the EFIS CP.

Ident.: DSC-31-CDS-40-40-60-10-00000871.0001001 / 09 MAR 16

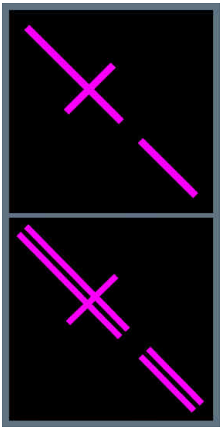
LATERAL DEVIATION

Lateral Deviation



LOC
F-LOC
Course Pointer
Deviation Bar
Deviation Scale
LOC
LOC or B/C

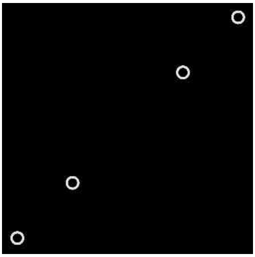
COURSE POINTER



Indicates the course of the selected approach. Appears when the selected approach is an ILS, GLS , an approach compatible with the SLS function, LOC, or LOC B/C approach.
During an approach flown with the FLS function (except LOC and LOC B/C), the course pointer appears doubled.

DEVIATION SCALE

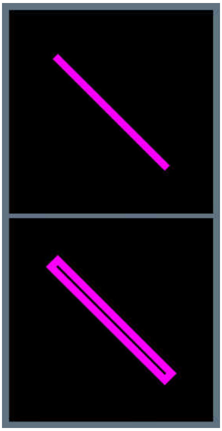
L12



The deviation scale consists in 4 dots. The maximum deviation is 2.5 ° either side.
The scale flashes when the lateral deviation becomes excessive. For more information, *Refer to DSC-31-CDS-40-20-110 LOC or F-LOC Deviation*.

DEVIATION BAR

L12



Indicates the aircraft lateral deviation in relation to the LS course.
The deviation bar flashes when the lateral deviation becomes excessive. For more information, *Refer to DSC-31-CDS-40-20-110 LOC or F-LOC Deviation*.
During an approach flown with the FLS function (except LOC and LOC B/C), the deviation bar appears doubled.

LOC OR B/C

LOC	The flight crew selected a LOC approach compatible with the FLS.
B/C	The flight crew selected a LOC B/C approach compatible with the FLS.

LS FLAGS

L12

LOC	The LOC deviation is not valid. Temporarily flashes, then remains steady.

L12

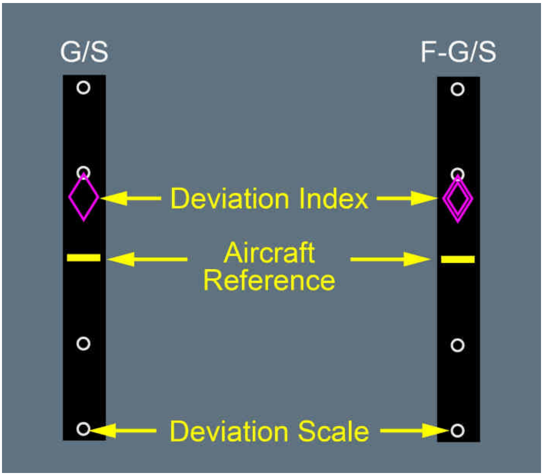
F-LOC	The F-LOC deviation is not valid. Temporarily flashes, then remains steady.

VERTICAL DEVIATION

Indicates the vertical deviation of the aircraft from the glide slope or the FMS glide slope, during the approach phase.

L2 Appears when:
- The flight crew selected an approach on the FMS
- The distance to the destination airport is less than 250 NM.

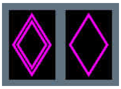
Vertical Deviation



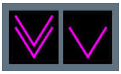
L1 DEVIATION SCALE

The deviation scale consists in 4 dots. The maximum deviation is 0.7 ° up or down.
The scale and the aircraft reference flash when the deviation becomes excessive.
For more information, *Refer to DSC-31-CDS-40-20-110 G/S or F-G/S Deviation*.

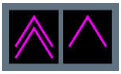
DEVIATION INDEX



The F-G/S or G/S deviation is within the scale.

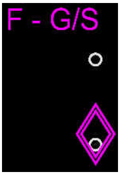


The F-G/S or G/S deviation is outside the scale.
The aircraft is above the G/S or F-G/S.



The F-G/S or G/S deviation is outside the scale.
The aircraft is below the G/S or F-G/S.

F-G/S LABEL



The flight crew selected an ILS G/S out, LOC, or LOC B/C approach, compatible with the FLS.

LS FLAGS

If the glide slope data is not valid, the ND displays the following flags, instead of the glide slope deviation:

L12

The flight crew selected an ILS, GLS ◁ , or an approach compatible with the SLS ◁ function, and the glide slope deviation is not valid.
Temporarily flashes, then remains steady.

L12

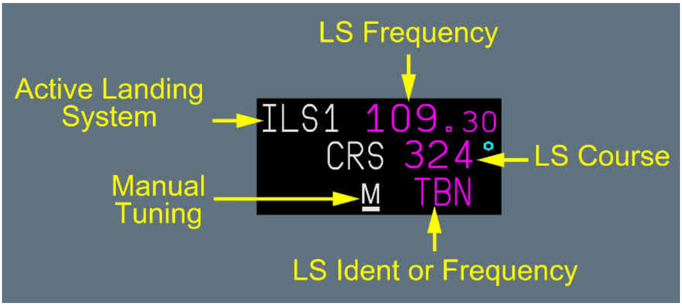
The flight crew selected an approach compatible with the FLS, and the F-G/S deviation is not valid.
Temporarily flashes, then remains steady.

Ident.: DSC-31-CDS-40-40-60-10-00000872.0002001 / 09 MAR 16

LS STATION

The ND displays the selected LS station information.

LS Station



ACTIVE LANDING SYSTEM

Landing guidance from MMR 1 is displayed on the CAPT PFD and on the F/O ND.
Landing guidance from MMR 2 is displayed on the CAPT ND and on the F/O PFD.

	ILS1	Indicates the active approach type (ILS, GLS ◁ , SLS ◁ , FLS, or LOC/FLS) and the source of the data (MMR 1 or MMR 2).
L2	ILS1	Indicates a malfunction of the active approach mode: - The glide slope deviation is not valid, or - The localizer deviation is not valid, or - The applicable MMR is not active, or - The distance to the runway threshold is not valid, in the case of an approach compatible with the FLS, a GLS ◁ , or an approach compatible with the SLS ◁ .
	LS1	The applicable MMR (MMR 1 or MMR 2) is not valid, or two approach modes are simultaneously selected from the MMR.

L1

LS FREQUENCY(CHANNEL)(SLOPE)

ILS Approach

	109.30	Indicates the ILS frequency in MHz.
L2	XX	The ILS frequency is not valid.
L23	---.--	The ILS frequency is not computed, or the frequency is outside the correct range. The range of the ILS frequency is between 108.10 MHz and 111.95 MHz.

L1

GLS Approach

Indicates the GLS channel.

L2

The GLS channel is not valid.

L23

The GLS channel is not computed, or the channel is not in the GLS range.
The range of the GLS channel is between 20001 and 39999.

L1

Approach Compatible with the SLS

Indicates the SLS channel.

L2

The SLS channel is not valid.

L23

Appears if:
- The SLS trajectory check is failed, or
  The MMR check of the SLS trajectory detects a discrepancy with the FMS database.
- The SLS channel is not computed
- The channel is not in the correct range.
  The range of the SLS channel is between 40000 and 99999.

L1

Approach Compatible with the FLS

Indicates the slope of an approach compatible with the FLS, in degrees.

L2

The FLS slope is not valid.

The FLS slope is not computed.

L1

LS COURSE

Indicates the LS course in degrees.

L2

The selected course is not valid, or two approach modes are simultaneously selected from the MMR.

The course is not computed.

L1 **LS IDENT OR FREQUENCY**

The ND displays the identifier of the approach mode:

- The ILS station identifier for an ILS approach

L2 The ILS station identifier is also displayed for an ILS G/S out, LOC, or LOC B/C approach, if they are flown without the FLS.

If the ILS ident is not valid, the ND displays the ILS frequency instead.

L1 - The identifier code for a GLS ◁ , SLS ◁ , or an approach compatible with the FLS.

MANUAL TUNING

R	The flight crew manually tuned the NAVAID via the RMP.
M	The flight crew manually tuned the NAVAID via the MFD.

Ident.: DSC-31-CDS-40-40-60-10-00000873.0001001 / 22 APR 14

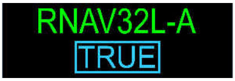
AZIMUTH LINE

A white line indicates the azimuth that is used for the computation of the vertical cut of the VD. For more information, *Refer to DSC-31-CDS-40-50 VD*.
The flight crew can manually select the VD AZIM mode via the VD AZIM knob, on the SURV panel. For more information, *Refer to DSC-34-SURV-30-10 Manual Azimuth Mode*.

Ident.: DSC-31-CDS-40-40-60-10-00000874.0001001 / 22 APR 14

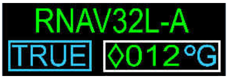
TRUE INDICATION

L12



The heading refers to true North, and the latitude of the aircraft is less than 65 ° North or South.
When the slats extend, the TRUE message temporarily flashes, then remains steady.

L12



The heading refers to true North, and the latitude of the aircraft is strictly more than 65 ° North or South.
The grid track indicates the true track of the aircraft.
When the slats extend, the TRUE message temporarily flashes, then remains steady.

When the aircraft approaches high latitudes, the SELECT TRUE NORTH REF message requests the flight crew to manually select the TRUE North reference.

L3 This message appears:
- Above 82 ° North, or
- Above 73 ° North, with a longitude between 120 ° West, and 90 ° West, or
- Below 60 ° South.

L1 To change the North reference, the flight crew can press the TRUE/MAG pb on the AFS CP. When the aircraft reaches high latitudes, the ADIRS automatically changes the MAG North reference to the TRUE North reference.

L3 The aircraft is at high latitudes:
- Above 82.5 ° North, or
- Above 73.5 ° North, with a longitude between 117.5 ° West, and 92.5 ° West, or
- Below 60.5 ° South.

L1 *Note:* *The BTV also displays messages in the same area, and has priority over the TRUE indication. When a BTV message is displayed, the TRUE indication appears under the TAS indication, on the third line. For more information about BTV messages, Refer to DSC-34-32-30-20-60 ND.*

L2 For more information about polar navigation, *Refer to DSC-22-FMS-10-30-30 Introduction*.

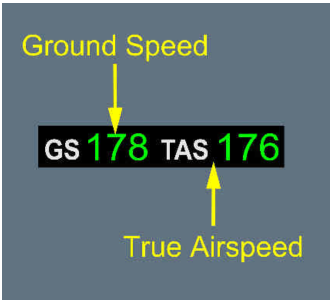
SPEED INDICATIONS

Speed Indications



Indicates the ground speed (GS) and the true airspeed (TAS) of the aircraft, in knots.

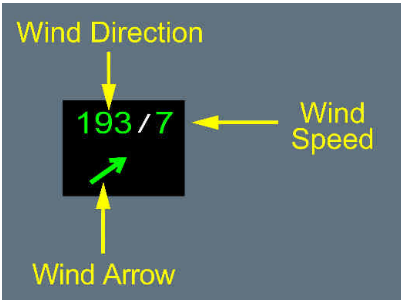
L3 The ADIRS provide the GS and the TAS. The ADIRS use the GPS and the IRS data for the GS computation.

Ident.: DSC-31-CDS-40-40-70-10-00000878.0001001 / 22 APR 14

WIND INDICATIONS

L3 The ADIRS provides the wind direction and speed.

Wind Indications



L1 Indicates the wind direction in degrees, and the wind speed in knots. The numerical value of the wind direction is given relative to true North.

When the wind speed exceeds 2 kt, the ND displays a green arrow that indicates the wind direction relative to the selected North reference (TRUE or MAG).

L13

The wind data is not computed.

Note: *The wind data is not computed when the TAS is below 100 kt.*

Ident.: DSC-31-CDS-40-40-70-10-00000879.0001001 / 22 APR 14

CHRONOMETER

To display the elapsed time, the flight crew can press the onside CHRONO pb on the EFIS CP. For more information, *Refer to DSC-31-CDS-40-60 CHRONO Pb*.

Indicates the elapsed time in minutes and seconds.

Indicates the elapsed time in hours and minutes.

ACTIVE NAVIGATION STATION

Indicates the VOR receiver currently displayed on the ND.
The flight crew can display the VOR1 or the VOR2 ◁ via the EFIS CP. For more information, *Refer to DSC-31-CDS-40-60 ND Data Display pb*.

L2

The VOR bearing is not valid.
Temporarily flashes, then remains steady.

L1

Indicates the ADF ◁ receiver currently displayed on the ND.
The flight crew can display the ADF1 ◁ or the ADF2 ◁ via the EFIS CP.
For more information, *Refer to DSC-31-CDS-40-60 ND Data Display pb*.

L2

The NDB ◁ bearing is not valid.
Temporarily flashes, then remains steady.

L1 **IDENTIFIER OR FREQUENCY**

L12

TOU	Indicates the VOR ident. If the VOR ident is not valid, the ND displays the following elements (if valid) instead, by order of priority: - The DME ident, or - The VOR frequency, or - The DME frequency.

L12

TOE	Indicates the NDB ◁ ident. If the NDB ident is not valid, the ND displays the NDB frequency instead.

MANUAL TUNING

R	The flight crew manually tuned the navaids via the RMP.
M	The flight crew manually tuned the navaids via the MFD.

L2 When the navaid is automatically selected by the FMS, no indication is displayed.

L1 **VOR BEARING CORRECTION**

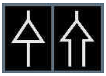
Indicates the VOR bearing correction, when the VOR reference from the FMS database (TRUE or MAG) is different from the current aircraft flying reference (TRUE or MAG).

CORR	When in ARC or ROSE-NAV mode, the VOR bearing is corrected for magnetic variation.
MAG	When in ROSE-VOR or ROSE-LS mode, the VOR reference is MAG. No correction is applied to the bearing.
TRUE	When in ROSE-VOR or ROSE-LS mode, the VOR reference is TRUE. No correction is applied to the bearing.

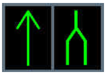
REMINDER INFORMATION

The reminder information enables to identify the pointer associated with a navaid currently displayed on the ND.

L12



Indicates the pointer associated with the VOR 1 or the VOR 2 ◁ .
In ARC or ROSE-NAV mode, when the VOR North reference (TRUE or MAG) is different from the current aircraft North reference (TRUE or MAG), the ND displays the VOR pointer in magenta.



Indicates the pointer associated with the ADF 1 ◁ or the ADF 2 ◁ .

DME DISTANCE

The DME distance only appears when the selected navaid is a VOR/DME.

Indicates the DME distance of the aircraft.

L2

The DME distance is not valid.
Temporarily flashes, then remains steady.

The DME distance is not computed.

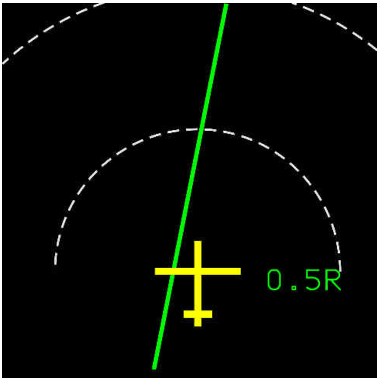
CROSS TRACK ERROR

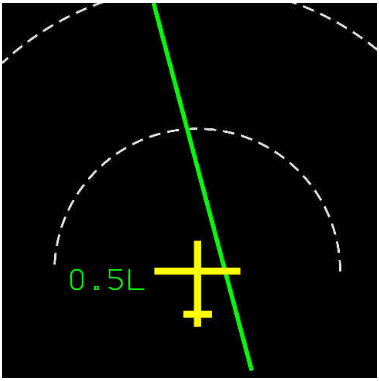
Indicates the lateral deviation of the aircraft from the active flight plan route, in nautical miles.
The precision of the cross track error is 0.1 NM and is increased to 0.01 NM during an RNP AR procedure with an RNP below 0.3.

L2 The cross track error pulses when the deviation exceeds 1 x RNP.

L1



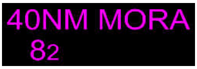
The aircraft is 0.5 NM right of the active flight plan.



The aircraft is 0.5 NM left of the active flight plan.

Ident.: DSC-31-CDS-40-40-80-10-00000884.0001001 / 22 APR 14

MORA



Indicates that the highest grid Minimum Off Route Altitude (MORA), in a circular area of 40 NM radius around the aircraft, is 8 200 ft.

Appears when the flight crew:
- Presses the CSTR pb, on the EFIS CP
- Selects an ND range that is above, or equal to, 40 NM.

The VD also displays safety altitudes. However, the VD displays the highest grid MORA or the MSA, along the aircraft trajectory and in the VD range. For more information, *Refer to DSC-31-CDS-40-50 Safety Altitude*.

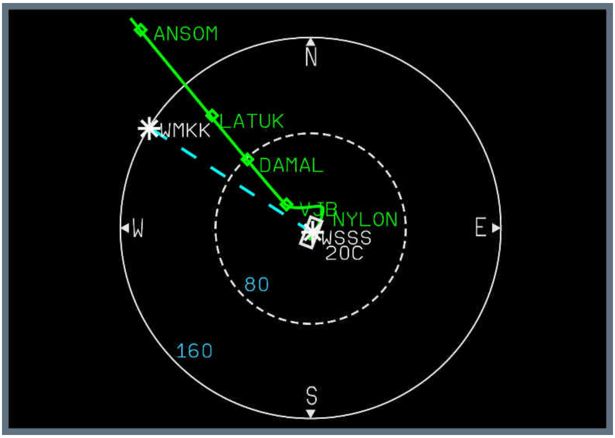
ALTERNATE FLIGHT PLAN

The ND displays the alternate flight plan as a dashed blue line.

Appears when:
- In ARC or ROSE-NAV mode, at least one waypoint of the alternate flight plan is displayed on the FMS F-PLN page of the onside MFD
- In PLAN mode, the Map Reference Point (MRP) is one of the waypoints of the alternate flight plan.

For more information, *Refer to DSC-22-FMS-10-40-20 Purpose*.

Alternate Flight Plan

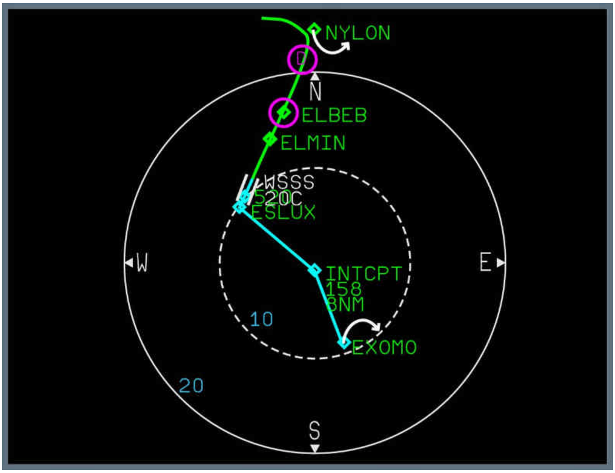


MISSED APPROACH

The ND displays the missed approach path as a solid blue line.

Appears when:
- In ARC or ROSE-NAV mode, at least one waypoint of the missed approach is on the onside MFD
- In PLAN mode, the MRP is one of the waypoints of the missed approach.

Missed Approach



OFFSET PATH

The offset path is parallel to the initial lateral flight plan. For more information, *Refer to DSC-22-FMS-10-40-20 Purpose*.

In the active (or secondary) flight plan, the ND displays:
- The offset path as a solid line
- The initial path as a dashed line.

Both the offset and the initial paths are of the same color as the flight plan route.
In the temporary flight plan, the ND displays the offset and the initial paths as dashed yellow lines.
The offset path is not associated with any waypoint. The ND only displays the waypoints that are on the initial path.

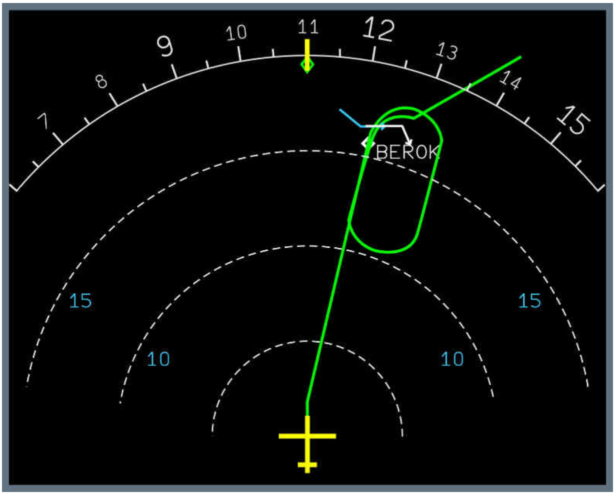
HOLDING PATTERN

The ND displays the entire holding pattern and its entry trajectory, only when:

- The ND range is 80 NM or less, and
- The TO waypoint is the hold entry fix.

Holding Pattern



ABN In all other cases, the ND displays the holding pattern symbol.

ENGINE-OUT STANDARD INSTRUMENT DEPARTURE (EOSID)

If an engine failure occurs before the diversion point, the ND displays the Engine-Out Standard Instrument Departure (EOSID) as a temporary flight plan (dashed yellow line), until:
- The aircraft sequences the diversion point, or
- The flight crew inserts or clears the EOSID.

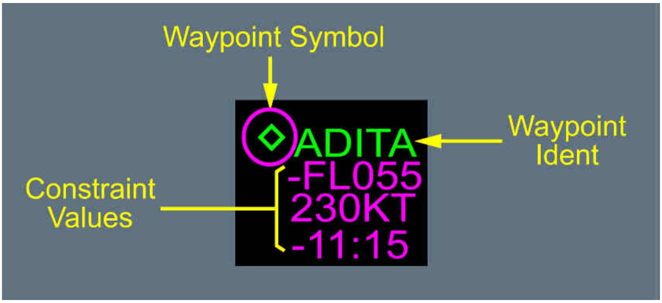
The ND displays a solid yellow line, instead of a dashed yellow line, if:
- An engine failure occurs after the diversion point, or
- An engine failure occurs before the diversion point, and the flight crew erased the temporary flight plan that contains the EOSID.
- The EOSID is displayed in PLAN mode (even with all engines operating).

For more information, *Refer to DSC-22-FMS-10-40-20 Purpose*.

Ident.: DSC-31-CDS-40-40-80-10-00000886.0001001 / 09 MAR 16

FLIGHT PLAN WAYPOINTS

Flight Plan Waypoints



WAYPOINT SYMBOL

Indicates a waypoint that is part of the active flight plan.

Indicates:
- The TO waypoint in the active flight plan, or
- Any secondary flight plan waypoint.

Indicates a waypoint that is part of the temporary flight plan.

Indicates:
- Any alternate flight plan waypoint, or
- Any waypoint that is part of the missed approach procedure.

If the flight plan waypoint is a tuned navaid, the following blue navaid symbols appear instead of the waypoint symbol:

Indicates a DME only or a TACAN.

Indicates a VOR.

Indicates a VORTAC, a collocated or non-collocated VOR/DME, or a non-collocated VORTAC.

Indicates an NDB ◁ .

When an altitude constraint is associated with the active flight plan waypoint, the ND displays a circle around the waypoint symbol.

Note: *The ND displays a circle that indicates an altitude constraint, even if the flight crew did not press the CSTR pb on the EFIS CP.*

	The FMS predicts that the aircraft will comply with the altitude constraint at the waypoint.
	The FMS predicts that the aircraft will not comply with the altitude constraint at the waypoint. An altitude constraint is not satisfied, when the predicted altitude differs from the constraint altitude by 250 ft at least.
	The FMS predicts that the aircraft will not take into account the altitude constraint at the waypoint.

WAYPOINT IDENT

The ND displays the waypoint ident in the same color as the associated flight plan, except for:
- The TO waypoint, that is in white, or
- The FIX INFO reference, that is in green, or
- The tuned navaids or NDBs ⊲✳ , that are in blue.

For more information, *Refer to DSC-22-FMS-20-20-20 Waypoint Ident*.

CONSTRAINT VALUES

When the flight crew presses the CSTR pb on the EFIS CP, the ND displays the constraints values below the waypoint ident.

If there are several constraints for the same waypoint, the ND displays the constraints in the following order of priority:
- The altitude constraint

L2 The ND displays the altitude constraint value:
- In FL, when the altitude is above the transition altitude or the barometric setting is set to STD
- In feet in all other cases.

L1 - The speed constraint

L2 The ND displays the speed constraint value in knots or as a Mach number.

L1 - The time constraint.

Note: *For ILS approaches, the ND only displays speed and time constraints at the FAF waypoint up to destination.*

The constraint value and the constraint symbol have identical color coding.

Note: *In PLAN mode, and at the MRP waypoint, the ND also displays the track and the distance to the next waypoint.*

Ident.: DSC-31-CDS-40-40-80-10-00000887.0003001 / 01 SEP 16

PSEUDO WAYPOINTS

Pseudo waypoints indicate vertical flight plan events in the active flight plan.

L2 The ND displays pseudo waypoints according to the following color coding system:
- Blue indicates what the aircraft will do, without any required flight crew action
- White indicates that a flight crew action is required, in order to follow the vertical flight plan
- Magenta indicates what the aircraft will do, in order to comply with an FMS constraint, without any required flight crew action
- Green indicates an information
- Amber indicates that the conditions associated with the pseudo waypoint are not satisfied.

L12

Pseudo Waypoint	Definition
	Indicates the point at which the aircraft will reach the level that is defined by an altitude constraint. Appears when NAV mode is engaged, and: - CLB, or DES, mode is armed, or - CLB, OP CLB, DES, OP DES, V/S, or FPA mode is engaged.
	Indicates the point at which the aircraft will reach the target altitude that is selected on the AFS CP. Appears when NAV mode is engaged, and: - CLB, or DES, mode is armed, or - CLB, OP CLB, DES, OP DES, V/S, or FPA mode is engaged.
	Indicates the predicted Top of Descent (TOD), regardless of the active guidance mode.
	Indicates the predicted TOD. Appears when NAV mode is engaged, and: - DES mode is armed, and ALT mode is engaged, or - CLB, DES, OP DES, V/S, or FPA mode is engaged.
	Indicates the predicted start of climb. Appears when NAV mode is engaged, and CLB mode is not armed.
	Indicates the predicted start of climb. Appears when NAV mode is engaged, and: - CLB mode is armed, and ALT mode is engaged, or - CLB, OPEN CLB, V/S, or FPA mode is engaged, and the pseudo waypoint that indicates that the aircraft reaches the level of an altitude constraint is displayed.

Continued on the following page

Continued from the previous page

Pseudo Waypoint	Definition
	Indicates the point at which the aircraft will intercept the FMS predicted descent or approach path, before the AFS CP selected altitude. Appears when NAV mode is engaged, and V/S or FPA mode is engaged.
	Indicates the point at which the aircraft will intercept the FMS predicted descent or approach path, before the AFS CP selected altitude. Appears when NAV mode is engaged, and DES or CLB mode is armed or engaged.
	In NAV mode and managed speed modes, indicates the starting point of an acceleration or deceleration segment, as computed by the FMS.
	In HDG/TRACK and managed speed modes, indicates the point at which the flight crew must change the speed due to the speed limit, while maintaining the selected track.
	Indicates the predicted start of an automatic deceleration, for an approach in a managed speed mode. Appears when: - NAV mode is engaged, or - NAV mode is armed, and the FMS predicts NAV mode engagement before the deceleration point.
	Indicates the predicted point at which the flight crew should start the deceleration, for an approach in a selected speed mode.
	Indicates the predicted location of the time marker along the F-PLN route. For more information about time markers, *Refer to DSC-22-FMS-10-80 Time Function*.
	Indicates the location of the Equi-Time Point (ETP) along the F-PLN route.

Ident.: DSC-31-CDS-40-40-80-10-00000888.0001001 / 06 NOV 14

FIX INFO DISPLAY

The flight crew uses the FIX INFO revision to compute the intersection of the flight plan and:
- A radial from a specified reference point, and/or
- A circle with a specified reference point as center, and/or

Note: The FMS searches only for the first intersection down-path the flight plan.

- The abeam line from a specified reference point.

If the flight crew inserts the intercept point in the temporary flight plan:
- The radial(circle)(abeam line) no longer appears
- The intercept point appears in yellow.

If the flight crew inserts the temporary flight plan, the intercept point appears in green, or in white if it is the TO waypoint.
For more information, *Refer to DSC-22-FMS-10-40-20 Purpose*.

RADIAL INTERCEPT

The ND displays the radial as a dashed blue line, if an intersection with the flight plan exists or not.

NAVIGATION DATABASE DATA

The complete navigation database and all the pilot stored elements are available for display on the ND.

WAYPOINTS

	Indicates a waypoint that is not part of the flight plan. Appears when the flight crew presses the WPT pb on the EFIS CP.

NAVAIDS

	Indicates a DME or a TACAN station. Appears when the flight crew presses the VORD pb on the EFIS CP.
	Indicates a VOR station. Appears when the flight crew presses the VORD pb on the EFIS CP.
	Indicates a VORTAC, a collocated or non-collocated VOR/DME, or a non-collocated VORTAC station. Appears when the flight crew presses the VORD pb on the EFIS CP
	Indicates an NDB ◁ station. Appears when the flight crew presses the NDB pb on the EFIS CP.

Note: The ND displays the tuned navaids in blue.

AIRPORT

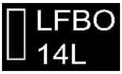
Indicates an airport different from the departure and destination airports of the flight plan.
Appears when the flight crew presses the ARPT pb on the EFIS CP.

Ident.: DSC-31-CDS-40-40-80-10-00000890.0001001 / 22 APR 14

AIRPORT SYMBOL

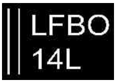
The ND displays the departure and destination airports for the active, temporary, and secondary flight plans.

The departure or the destination waypoint is an airport, and the runway is not specified.



The departure or the destination waypoint is a runway, and the flight crew selected an ND range that is more, or equal to, 160 NM.
The ND orientates the runway symbol according to the actual runway magnetic heading.

L12



The departure or the destination waypoint is a runway, and the flight crew selected an ND range that is less than 160 NM.
The ND orientates the runway symbol according to the actual runway magnetic heading.
The dimension of the runway symbol is proportional to the actual runway length, and is adjusted according to the selected ND range.

Ident.: DSC-31-CDS-40-40-80-10-00000891.0001001 / 22 APR 14

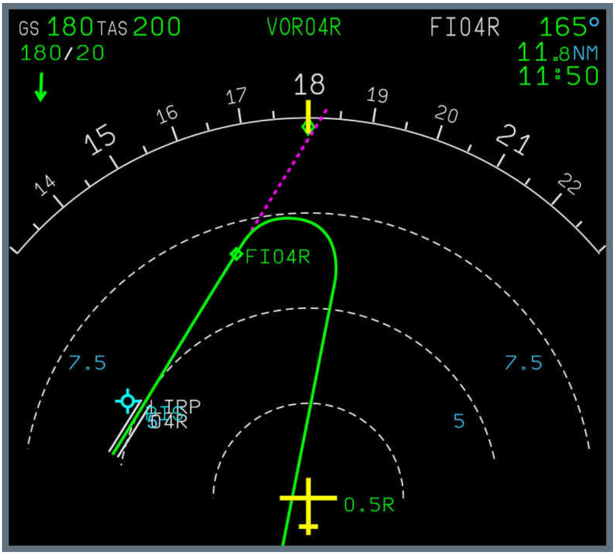
FLS BEAM

Indicates the FLS beam of an approach compatible with the FLS.

L2 Appears when the flight crew:
- Selected an approach compatible with the FLS in the active flight plan
- Pressed the LS pb on the EFIS CP
- Selected an ND range that is less than, or equal to:
  - 80 NM in ARC or PLAN mode, or
  - 160 NM in ROSE-NAV mode.

L1 If the anchor point does not correspond to the runway threshold, the FMS displays the anchor point ident in magenta.
For more information about the FLS beam, *Refer to DSC-22-FMS-10-30-40 FLS Beam on ND*.

FLS Beam



Ident.: DSC-31-CDS-40-40-80-10-00019854.0001001 / 22 APR 14

DEPARTURE AND APPROACH NAME

RNAV32L-A

Indicates the type and the name of the approach procedure, when the approach exists in the flight plan, and:
- The active flight phase is DES, APPR, or GA, or
- The active flight phase is CRZ, and the along track distance to destination is less than 250 NM.

AFRI5A

Indicates the name of the departure procedure (SID name), when the departure exists in the flight plan, and:
- The active flight phase is PREFLIGHT, or
- The active flight phase is T.O or CLB, and the aircraft flies the departure as defined in the FMS.

Ident.: DSC-31-CDS-40-40-80-10-00000892.0001001 / 22 APR 14

END OF VD

Indicates the end of the VD, when the aircraft follows a flight plan route.

Note: *When the destination airport is in the VD range, the end of VD symbol indicates the end of the active flight plan.*

For more information, *Refer to DSC-31-CDS-40-50 Range*.

Ident.: DSC-31-CDS-40-40-80-10-00000893.0001001 / 22 APR 14

INTERACTIVE ND

The flight crew can use the KCCU to modify the flight plan directly from the ND. For more information, *Refer to DSC-31-CDS-40-40-100 Interactive ND Overview*.

BACKUP TRAJ

BACKUP TRAJ

Ident.: DSC-31-CDS-40-40-90-00019325.0001001 / 03 JUL 20
Applicable to: ALL

The BACKUP TRAJ function is active if:

- The two active FMCs fail (in a short period of time), or

  For more information, *Refer to DSC-22-FMS-40 Failure of Two FMCs (SINGLE Mode)*.
- The three FMCs fail, or

  For more information, *Refer to DSC-22-FMS-40 Failure of All FMCs (Backup Navigation)*.
- The PRIMs reject the data from the two active FMCs during an RNP AR procedure.

  For more information, *Refer to DSC-22-FMS-40 FMC Data Not Valid during a RNP AR Procedure*.

If the BACKUP TRAJ function is active, the BACKUP TRAJ message appears at the top of the ND, and the following elements remain available:

- The active flight plan trajectory and waypoints

  The active flight plan trajectory is displayed as a dashed green line. The TO waypoint is displayed in green instead of white.
- The temporary flight plan

  The temporary flight plan trajectory is displayed as a dashed yellow line.
- The offset trajectory
- The missed approach trajectory and waypoints

  The missed approach trajectory is displayed as a dashed blue line.
- Constraint values, only if CSTR was selected on the EFIS CP at the moment of the failure.

The BACKUP TRAJ function enables the recovery of data within a circular area of 80 NM radius around the aircraft. However, all data related to a terminal area procedure is recovered, regardless of the distance.

When in BACKUP TRAJ, the flight crew can still change the ND mode and range.

Note: *The BACKUP TRAJ function automatically deactivates when at least one FMC provides a valid flight plan to the CDS. During a RNP AR procedure, the BACKUP TRAJ function deactivates only if, above safety altitude, the flight crew revises the active flight plan at aircraft present position (i.e. DIR TO).*

Intentionally left blank

Interactive ND

INTERACTIVE ND OVERVIEW

Ident.: DSC-31-CDS-40-40-100-00000894.0001001 / 22 APR 14
Applicable to: ALL

The flight crew can perform the following FMS tasks, via the interactive functions of the ND:
- Direct to: FROM P.POS DIR TO or DIR TO (*Refer to DSC-31-CDS-40-40-100 DIRECT TO*)
- Insert a waypoint: INSERT NEXT WPT (*Refer to DSC-31-CDS-40-40-100 INSERT NEXT WPT*)
- Delete a waypoint: DELETE (*Refer to DSC-31-CDS-40-40-100 DELETE - Purpose*)
- Select an airport for data consultation: DATA (*Refer to DSC-31-CDS-40-40-100 DATA - Purpose*)
- Insert or delete/undo a temporary flight plan (*Refer to DSC-31-CDS-40-40-100 INSERT or ERASE TMPY - Purpose*).

The interactive functions of the ND are only available in ARC, PLAN, or ROSE-NAV mode.
In PLAN mode, the flight crew can scroll through the entire flight plan with the KCCU wheel.

ACCESS

To move the cursor to the ND with the KCCU, the flight crew can:
- Press the ND key ND, or
- Press the navigation key ◀◀ ▶▶ .

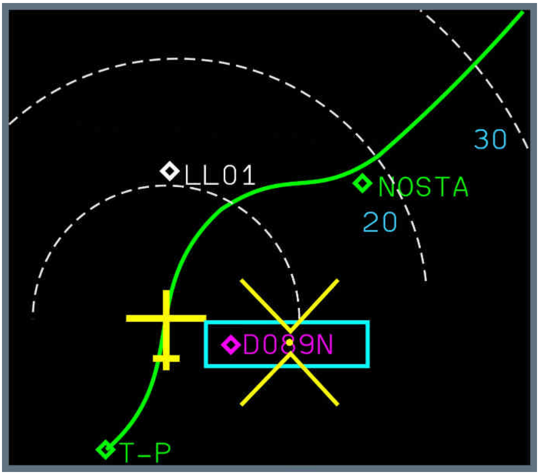
INTERACTIVE ELEMENTS

The flight crew can use the cursor to click on:
- The aircraft symbol
- The flight plan waypoints
- The navigation database waypoints, airports, and navaids.

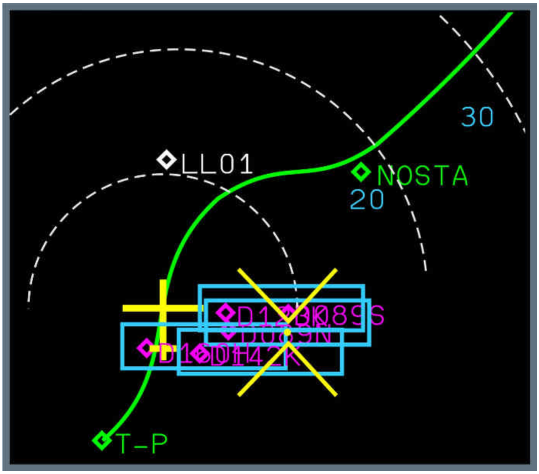
L2 If the ND displays a DIR TO temporary flight plan, no FMS revision is available via the interactive ND.
If the ND displays a secondary flight plan, the interactive functions are only available for the optional airports.

L1 Blue rectangles highlight the interactive areas around a selected element.

Interactive Area



L2 When several interactive elements are available in the same area, they are all highlighted with blue rectangles.



When the flight crew clicks on one of the highlighted elements, a declutter menu appears. This menu lists all the interactive elements available in the area of the cursor, and enables the flight crew to choose the element they want to interact with.

○ CRS IN

○ CRS OUT

Ident.: DSC-31-CDS-40-40-100-10-00000910.0001001 / 22 APR 14

PURPOSE

The DIRECT TO page enables the flight crew to insert:

- A DIRECT TO leg (DIRECT)
- A DIRECT TO leg, with the projection of the intermediate waypoints on the direct trajectory to the target waypoint (DIRECT WITH ABEAM)

- A DIRECT TO leg, with the interception of a specific inbound radial (CRS IN)
- A DIRECT TO leg, with the interception of a specific outbound radial (CRS OUT).

The DIRECT TO page is only available for the active flight plan.
For more information about the DIRECT TO function, *Refer to DSC-22-FMS-10-40-20 Purpose*.

ACCESS

The flight crew can access the DIRECT TO revision of the ND when they select:

- DIR TO, from the aircraft symbol, or

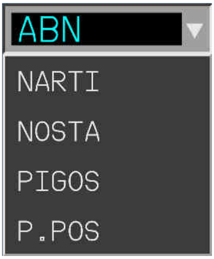
TARGET WAYPOINT

To select a target waypoint, the flight crew can:

- Click on the waypoint they want to use as a target, and choose the option FROM P. POS DIR TO
- Click on the aircraft mock-up, and use the DIRECT TO option

  Then, the flight crew can click on any element displayed on the ND to use it as a target. It is also possible to click on a blank area of the ND to create a target waypoint.

- Choose an element from the target waypoint list displayed in the lower part of the ND



- Type the ident of the target waypoint in the entry field displayed in the lower part of the ND. If several elements have the same ident, the flight crew can choose the appropriate target waypoint from a list that indicates the latitude and longitude of each element.

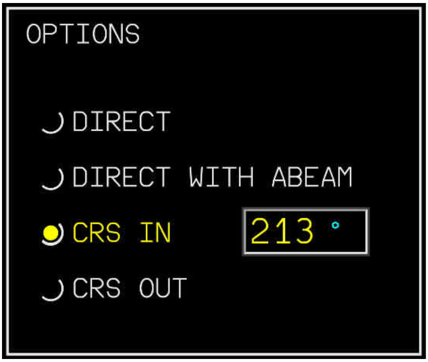
Ident.: DSC-31-CDS-40-40-100-10-00000913.0001001 / 22 APR 14

OPTIONS

L2 The default DIRECT TO option is DIRECT, or DIRECT WITH ABEAM, depending on the Operator's choice. The AMI file defines the default DIRECT TO option (*Refer to DSC-22-FMS-10-20 Airline Modifiable Information (AMI) File*).

L1 When the flight crew selects the CRS IN or the CRS OUT option, an entry field appears.

CRS ENTRY FIELD



OPTIONS

○ DIRECT

○ DIRECT WITH ABEAM

● CRS IN 213 °

○ CRS OUT

If the DIRECT TO target waypoint is a flight plan waypoint, the FMS sets the inbound(outbound) course to a default value.
The default CRS IN is a direct course from the waypoint that precedes the target waypoint.
The default CRS OUT is a direct course to the waypoint that follows the target waypoint.
For more information about the entry format of the course, *Refer to DSC-22-FMS-20-80 CRS IN(OUT)*.

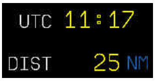
TARGET WAYPOINT INFO



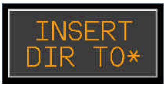
UTC 11:17
DIST 25 NM

Indicates the UTC time of arrival at the target waypoint, and the distance to the target waypoint.

Ident.: DSC-31-CDS-40-40-100-10-00000916.0001001 / 22 APR 14

INSERT DIRECT TO BUTTON

L12

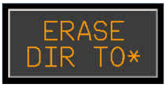


When clicked, inserts the temporary flight plan. For more information about the F-PLN page of the FMS, *Refer to DSC-22-FMS-20-20 F-PLN Page*.

The ND displays the INSERT DIRECT TO button, when:
- A DIR TO temporary flight plan exists
- The cursor is in the ND window.

ERASE DIRECT TO BUTTON

L12



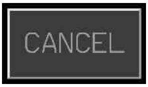
When clicked, erases the temporary flight plan. For more information about the F-PLN page of the FMS, *Refer to DSC-22-FMS-20-20-20 F-PLN Page*.

The ND displays the ERASE DIRECT TO button, when:
- A DIR TO temporary flight plan exists
- The cursor is in the ND window.

Ident.: DSC-31-CDS-40-40-100-10-00000917.0001001 / 22 APR 14

CANCEL BUTTON

L12



When clicked, closes the DIRECT TO ND page, and displays the flight plan on the ND.
Appears when no temporary flight plan is on standby.

INSERT NEXT WPT BERAB FROM ABN IN TMPY

44°03.4N/008°13.3E

Ident.: DSC-31-CDS-40-40-100-20-00000919.0001001 / 22 APR 14

PURPOSE

The flight crew uses the insert next waypoint (INSERT NEXT WPT) revision to insert a waypoint after a revised waypoint.

The flight crew can insert:
- A flight plan waypoint
- Any navigation database waypoint, airport, or navaid
- A latitude/longitude (LL), a Place/Bearing/Distance (PBD), a Place-Bearing/Place-Bearing (PB/PB), or a Place/Distance (PD) waypoint.

L2 *Note:*
- *A PD waypoint, with a negative distance (example: LMG/-15), is inserted "before" the revised waypoint*
- *The "place" waypoint must be the revised waypoint*
- *The distance to the PD waypoint is limited, so that the PD waypoint cannot be located before(after) the waypoint that precedes(follows) the revised waypoint.*

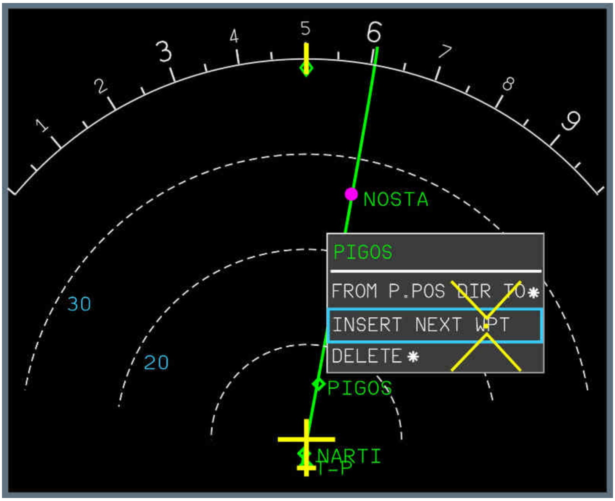
L1 For more information about the INSERT NEXT WPT function, *Refer to DSC-22-FMS-10-40-20 Purpose*.

Ident.: DSC-31-CDS-40-40-100-20-00000921.0001001 / 22 APR 14

ACCESS

The flight crew can access the INSERT NEXT WPT revision of the ND with the selection of the INSERT NEXT WPT option from any interactive element of the flight plan.

INSERT NEXT WPT Revision



Ident.: DSC-31-CDS-40-40-100-20-00000922.0001001 / 22 APR 14

REVISED WAYPOINT

FROM ABN

Indicates the waypoint from which the flight crew selected the INSERT NEXT WPT revision.

Appears:
- In green, when the waypoint is part of the active flight plan, or
- In yellow, when the waypoint is part of the temporary flight plan.

Ident.: DSC-31-CDS-40-40-100-20-00000923.0001001 / 22 APR 14

REVISED FLIGHT PLAN

IN TMPY

Indicates that the revised waypoint is part of the temporary flight plan. Appears when the revised flight plan is the temporary flight plan.

Ident.: DSC-31-CDS-40-40-100-20-00000924.0001001 / 22 APR 14

REVISED WAYPOINT LATITUDE/LONGITUDE

44°03.4N/008°13.3E

Indicates the latitude and longitude of the revised waypoint, unless the revised waypoint is the FROM waypoint.

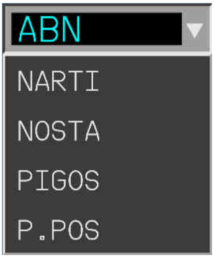
Appears:
- In green, when the waypoint is part of the active flight plan, or
- In yellow, when the waypoint is part of the temporary flight plan.

Ident.: DSC-31-CDS-40-40-100-20-00000926.0001001 / 22 APR 14

NEXT WAYPOINT

To select the next waypoint, the flight crew can:

- Click on any element displayed on the ND, or on a blank area of the ND to create a latitude/longitude waypoint
- Choose an element from the next waypoint list displayed in the lower part of the ND



- Type the ident of the target waypoint in the entry field displayed in the lower part of the ND. If several elements have the same ident, the flight crew can choose the appropriate target waypoint from a list that indicates the latitude and longitude of each element.

CANCEL BUTTON

L12

When clicked, closes the DIRECT TO ND page, and displays the flight plan on the ND.
Appears when no temporary flight plan is on standby.

DELETE

Applicable to: ALL

Ident.: DSC-31-CDS-40-40-100-30-00000904.0001001 / 22 APR 14

PURPOSE

The flight crew uses the DELETE revision:

- To remove a waypoint from the flight plan
- To insert a discontinuity.

For more information about the DELETE function, *Refer to DSC-22-FMS-10-40-20 Purpose*.

Ident.: DSC-31-CDS-40-40-100-30-00000928.0001001 / 22 APR 14

ACCESS

The flight crew can access the DELETE revision of the ND with the selection of the DELETE * option from any interactive element of the flight plan.

FMS MESSAGES

AREA RNP X.XX	Appears during an RNP AR approach if: - There is no RNP value stored in the navigation database for the current leg - The flight crew did not manually enter an RNP value for the current leg. In this case, the RNP value is the FMS default RNP value.
CHECK NORTH REF	For more information, *Refer to DSC-22-FMS-20-90 CHECK NORTH REF*.

FMS PAGE NOT AVAIL	At least one active FMC failed or the two FMS operate in independent mode during an RNP AR approach. Appears instead of the FMS dialog box, at the bottom of the ND page. For more information about the display conditions of this message, *Refer to DSC-22-FMS-40 Abnormal Operation*.
LEG RNP X.XX	Appears during an RNP AR approach when: - The RNP value for the current leg is available in the navigation database - The flight crew did not manually enter an RNP value for the current leg.
MAN RNP X.XX	Appears during an RNP AR approach when the flight crew manually entered an RNP value for the current leg.

L12

MAP PARTLY DISPLAYED	Appears in ARC, ROSE-NAV, or PLAN mode: - If the data transmission between the FMS and the CDS is not complete, or - If the CDS cannot provide the entire map. The FMS or the CDS provides the MAP PARTLY DISPLAYED message.
NAV ACCUR DOWNGRADED	For more information, *Refer to DSC-22-FMS-20-90 NAV ACCUR DOWNGRADED*.
NAV ACCUR UPGRADED	For more information, *Refer to DSC-22-FMS-20-90 NAV ACCUR UPGRADED*.
NAV PRIMARY	For more information, *Refer to DSC-22-FMS-20-90 NAV PRIMARY*.
NAV PRIMARY LOST	For more information, *Refer to DSC-22-FMS-20-90 NAV PRIMARY LOST*.
RNP AR CAPABILITY LOST	The two FMS operate in independent mode during an RNP AR approach. For more information, *Refer to DSC-22-FMS-40 INDEPENDENT Mode*.
SELECT TRUE NORTH REF	For more information, *Refer to DSC-22-FMS-20-90 SELECT TRUE NORTH REF*.
SPECIF VOR-D NOT AVAIL	For more information, *Refer to DSC-22-FMS-20-90 SPECIF VOR-D NOT AVAIL*.

Ident.: DSC-31-CDS-40-40-150-10-00019821.0001001 / 29 JUL 14

DISPLAY MESSAGES

BACKUP TRAJ	Indicates that the BACKUP TRAJ is active. Appears when the CDS required inputs from at least two FMCs are lost. For more information about the BACKUP TRAJ activation condition, *Refer to DSC-22-FMS-40 Abnormal Operation*. For more information about the ND display when in BACKUP TRAJ, *Refer to DSC-31-CDS-40-40-90 BACKUP TRAJ*.
L12	
CHECK CAPT(F/O) INR DU	The CDS detects erroneous data displayed on the CAPT(F/O) inner DU. Temporarily flashes, then remains steady.
L12	
CHECK CAPT(F/O) OUTR DU	The CDS detects erroneous data displayed on the CAPT(F/O) outer DU. Temporarily flashes, then remains steady.
L12	
CHECK CTR LWR DU	The CDS detects erroneous data on the center lower DU. Temporarily flashes, then remains steady.
L12	
CHECK CTR LWR DU & F/O HUD	The CDS detects a discrepancy between the data displayed on the center lower DU and the F/O HUD. Temporarily flashes, then remains steady.
L12	
CHECK CTR UPPR DU	The CDS detects erroneous data displayed on the center upper DU. Temporarily flashes, then remains steady.
L12	
CHECK CTR UPPR DU & CAPT HUD	The CDS detects a discrepancy between the data displayed on the center upper DU and the data displayed on the CAPT HUD. Temporarily flashes, then remains steady.

L12

CHECK HDG	Appears in ARC or ROSE mode, if the CDS detects a discrepancy between the heading parameters of the CAPT EFIS and the F/O EFIS. The CDS detects a discrepancy, if the difference between the two headings exceeds: - 5 ° in TRUE North reference - 7 ° in MAG North reference. Temporarily flashes, then remains steady. For more information about the warning and the procedure associated with the CHECK HDG message, *Refer to PRO-ABN-NAV NAV CAPT & F/O HDG DISAGREE*.
MAP NOT AVAIL	Appears if: - ND MODE CHANGE or ND RANGE CHANGE appears for more than 6 s, or - The aircraft true heading is not valid, or - One active FMC or two FMCs failed. For more information about the display conditions of this message related to an FMC failure, *Refer to DSC-22-FMS-40 Abnormal Operation*.
ND MODE CHANGE	Appears when the flight crew changes the ND mode, and the new display is being prepared.
ND RANGE CHANGE	Appears when the flight crew changes the ND range, and the new display is being prepared.

L12

NO AZIM IN PLAN	Appears when: - The flight crew selects the manual AZIM mode of the SURV system - The ND is in PLAN mode. *Note:* *The AZIM mode is not available in PLAN mode.*
OFFSIDE FM CONTROL	Appears in ARC, ROSE-NAV, or PLAN mode, when the offside FMS supplies the ND. When the FMS selector is set to BOTH ON 1(2), the active FMC on the CAPT(F/O) side provides data to the flight management interfaces of both sides. For more information about the display when BOTH ON1(2) is selected, *Refer to DSC-22-FMS-20-70 FMS Selector*.

RWY AHEAD	For more information, *Refer to DSC-34-NAV-80-20 Runway Approaching Advisory*.

Intentionally left blank

VD

Applicable to: ALL

Ident.: DSC-31-CDS-40-50-10-00000985.0001001 / 02 OCT 14

The Vertical Display (VD) provides the flight crew with an overview of the vertical position of the aircraft. The VD is a secondary means of navigation, that increases the flight crew's awareness of the aircraft vertical location.
The VD is located below the Navigation Display (ND).
The VD is only available in ARC and ROSE-NAV modes.
When the flight crew sets the EFIS CP RANGE selector to ZOOM, the Airport Navigation Function (ANF) appears on the ND and covers the vertical display area too. For more information about the ANF, *Refer to DSC-34-NAV-80-10 General*.

The VD provides the current aircraft position, in relation to:
- The predicted vertical trajectory (with its associated waypoints and altitude constraints)
- Safety altitudes
- The weather
- The terrain profile.

L2 *Note:* *The VD update occurs after the computations of the FMS, and may last a few seconds longer than the ND update.*

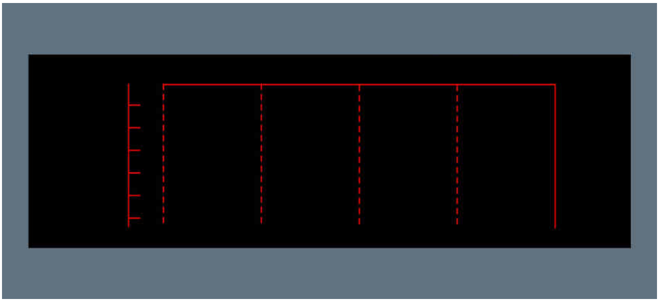
If the input data that the VD requires is not valid, the VD frame is displayed in red:

Data not Valid



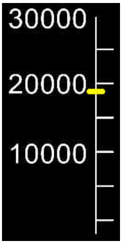
Ident.: DSC-31-CDS-40-50-10-00000987.0001001 / 22 APR 14

VERTICAL SCALE

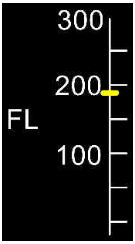
The FMS defines the origin of the vertical scale, in order to display:

- The aircraft symbol
- Most of the aircraft trajectory.

The altitude increment and the magnitude of the vertical scale depend on the selected horizontal range. The unit of the vertical scale values depends on the barometric reference in use (QNH or STD). For more information about the barometric reference selection, *Refer to DSC-31-CDS-40-60 Barometric Reference*.



The vertical scale is displayed in feet (ft) when the flight crew selects a QNH barometric setting.



The vertical scale is displayed in flight levels (FL) when the flight crew selects a STD barometric setting.

L3 The magnitude of the vertical scale cannot exceed 70 000 ft or FL 700, and cannot be less than 1 500 ft.
The vertical scale is associated with the ND range that the flight crew selects on the EFIS CP. The diagonal of the VD is equal to a 4 ° slope.

Ident.: DSC-31-CDS-40-50-10-00000989.0001001 / 02 OCT 14

RANGE

The VD range is adjusted in accordance with the ND range that the flight crew selects on the EFIS CP.

The VD range is limited to 160 NM and:
- In ARC mode, the VD range is equal to the ND range
- In ROSE-NAV mode, the VD range is half the ND range, because the VD only shows the area ahead of the aircraft.

For more information about the ND range selection, *Refer to DSC-31-CDS-40-60 ND Range Sel*.
The aircraft mock-up is the origin of the horizontal scale.

For example:
- In ARC mode, the flight crew selects 160 NM, via the ND range selector, or
- In ROSE-NAV mode, the flight crew selects 320 NM, via the ND range selector.

- In ARC mode, the flight crew selects 320 NM or 640 NM, via the ND range selector, or
- In ROSE-NAV mode, the flight crew selects 640 NM via the ND range selector.

Ident.: DSC-31-CDS-40-50-10-00000990.0001001 / 22 APR 14

AIRCRAFT REFERENCE

L3 The CDS computes the aircraft reference.
L1 The aircraft reference indicates the current barometric altitude of the aircraft.

ALTITUDE SYMBOL

Indicates the aircraft altitude on the vertical scale.

AIRCRAFT MOCK-UP

Appears when the flight crew selects the AUTO AZIM mode of the SURV system.
The aircraft mock-up is adjusted in accordance with the pitch attitude of the aircraft, the angle-of-attack, and the flight path angle.

L2 *Note:* *The aircraft mock-up may no longer appear on the VD scale, when the aircraft descends, and the altitude target set on the AFS CP is too high.*

L1

PITCH ATTITUDE NOT VALID

L12

Indicates the aircraft altitude on the vertical scale, when the pitch attitude of the aircraft is not valid. In addition, the ATT flag appears in the middle of the VD.
The ATT flag temporarily flashes, then remains steady.

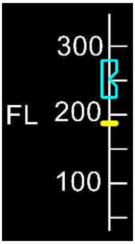
MANUAL AZIM MODE

Appears when the flight crew selects the MANUAL AZIM mode of the SURV system.

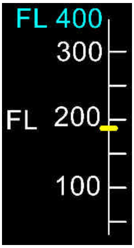
Ident.: DSC-31-CDS-40-50-10-00000992.0001001 / 22 APR 14

AFS CP SELECTED ALTITUDE

The altitude target that the flight crew selects on the AFS CP also appears on the vertical scale of the VD. For more information about the altitude target selection, *Refer to DSC-22-FG-90-20 Vertical Control*.

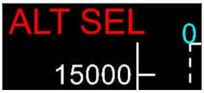


The altitude target that the flight crew selected on the AFS CP is within the vertical scale.



The altitude target that the flight crew selected on the AFS CP is outside the vertical scale.
In this case, the VD displays a numerical value instead. This value appears either at the top or at the bottom of the scale.

L12



The selected altitude is not available.
The ALT SEL message temporarily flashes, then remains steady.

Ident.: DSC-31-CDS-40-50-10-00000993.0001001 / 22 APR 14

ALTITUDE CONSTRAINTS

The VD displays altitude constraints that are defined in the active flight plan. For more information about altitude constraints, *Refer to DSC-22-FMS-10-40-30 Purpose*.

INDICATIONS IN THE DISPLAY ZONE

The VD displays the altitude constraints that will be complied with, with the following symbols:

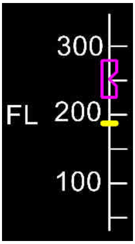
-  The FMS predicts that the aircraft will comply with the constraint at this altitude.
-  The FMS predicts that the aircraft will comply with the constraint at or below this altitude.
-  The FMS predicts that the aircraft will comply with the constraint at or above this altitude.
-  The FMS predicts that the aircraft will comply with the constraint between these two altitudes.

The same symbols appear in white, when the altitude constraint is ignored.
In selected mode, the FMS can no longer predict if the aircraft will comply with the altitude constraints. In this case, the VD displays the constraint symbol in white.

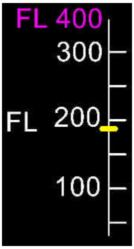
The FMS predicts that the aircraft will not comply with the constraint.
The constraint symbol is prolonged with a dotted amber line. This helps the flight crew to identify the missed constraint, even when the symbol is not in the VD window.

INDICATIONS ALONG THE VERTICAL SCALE

Altitude constraints are also indicated along the vertical scale of the VD, when the ALT CST*or ALT CST mode is engaged. The next altitude constraint that the aircraft will encounter is indicated as follows:



The altitude constraint is within the scale.



The altitude constraint is outside the scale. The value of the constraint is displayed instead of the symbol, at the top, or at the bottom of the scale.

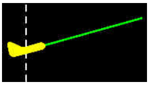
Vertical Trajectory

L123



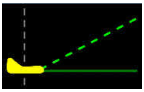
Indicates the trajectory the aircraft will fly, without any further action from the flight crew.

Appears when:
- The aircraft flies in managed mode, and follows the flight plan or the LS beam, or
- The aircraft flies with a selected vertical mode.

If the flight crew selects an altitude target on the AFS CP, the solid green line is intercepted by a level-off segment at this altitude, except in final descent, when G/S*, F-G/S*, G/S, or F-GS mode is engaged.

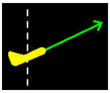
Note: *If the V/S mode is engaged, the solid green line takes into account the V/S value selected on the AFS CP. The FMS does not determine if the aircraft can achieve this vertical speed.*

L12



Indicates the predicted FMS trajectory that the aircraft will follow, if managed vertically.

Note: *On the ND, the green dotted line indicates the initial path, when the flight crew created an offset in the flight plan.*

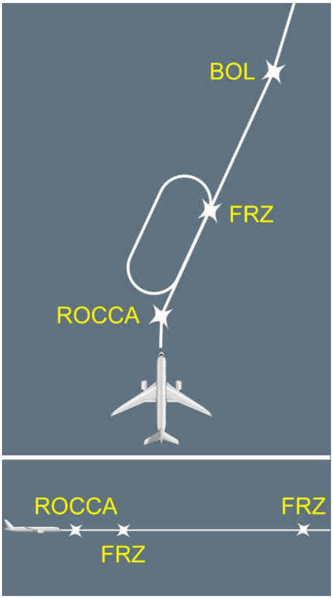


Indicates the current flight path angle of the aircraft.

Appears when:
- The aircraft does not follow the FMS trajectory or the selected trajectory, or
- The FMS predictions cannot be computed.

HOLDING PATTERN

L12

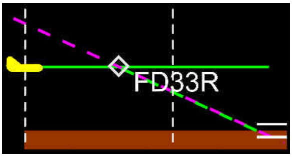


When the FMS takes into account the holding pattern in its predictions, the VD unfolds the holding trajectory.

FMS predictions take into account the holding pattern when:
- The deceleration point is flown in managed speed, or
- The entry fix is sequenced in selected speed mode.

FLS BEAM

L12



The magenta dashed line indicates the FLS beam.

Appears when:
- The flight crew selected an approach compatible with the FLS in the FMS
- The flight crew pressed the LS pb on the AFS CP
- The vertical cut is defined along the flight plan or along the LS axis
- The flight crew selected an ND range that is less than or equal to:
  - 80 NM in ARC mode, or
  - 160 NM in ROSE-NAV mode.

When the destination temperature entered in the APPR panel of the ACTIVE/PERF page of the MFD, is below the ISA temperature, the FLS beam is corrected.

If the anchor point is located at the runway threshold, the FMS displays the anchor point ident in magenta.

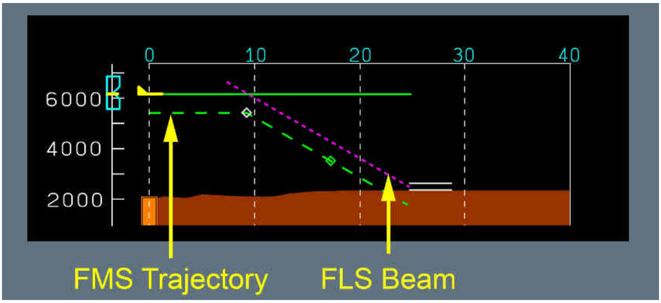
COLD WEATHER DISPLAY

In cold weather, the following information on the VD may not be consistent until the G/S* or the F-G/S* mode is engaged.

Before Glide Capture

When the destination temperature (entered in the APPR panel of the MFD PERF page) is below ISA, the FMS vertically offsets the FLS beam and runway symbols to maintain the vertical clearance with the ground. However, the FMS predicted path is not corrected for temperature deviation below ISA. As a consequence, the FMS descent path (in green) and the FLS beam (in magenta) will not be superimposed on the VD.
In addition, as per procedure, the flight crew is also requested to increase the altitude of the aircraft according to the temperature deviation below ISA. As a consequence, the VD will show a solid green line (corresponding to the corrected path of the aircraft) above the FMS predicted trajectory.

Cold Weather with FLS Function



After Glide Capture

During the glide capture, the FMS vertical trajectory is corrected according to the outside temperature. The FLS beam (if any), the FMS trajectory, the terrain, and the runway are correctly displayed.

Ident.: DSC-31-CDS-40-50-10-00000996.0001001 / 03 SEP 14

WAYPOINTS

The VD displays waypoints that are part of the active flight plan.

L2 If the G/S*, F-G/S*, G/S, or F-G/S mode is engaged, the FMS corrects the altitude of the destination waypoint according to the destination temperature that the flight crew enters in the APPR panel of the ACTIVE/PERF page.

If the flight crew defines an offset in the flight plan, the VD displays the waypoints that are associated with the initial flight path (i.e. the flight path that is displayed in green dashes on the ND). However, the vertical cut considers the green solid line of the ND that is associated with the active flight plan.

L1 FLIGHT PLAN WAYPOINTS

	Indicates a waypoint that is part of the active flight plan.
	Indicates: - The TO waypoint in the active flight plan, or - Any secondary flight plan waypoint.
	Indicates a waypoint that is part of the temporary flight plan.
	Indicates: - Any alternate flight plan waypoint, or - Any waypoint that is part of the missed approach procedure.

L2 At the destination airport, the VD displays the destination symbol instead of the waypoint symbol.
If the FMS predicts a waypoint and an altitude constraint to be at the same altitude, the VD only displays the altitude constraint symbol.

L1 ORIGIN AND DESTINATION WAYPOINTS

	The origin or destination waypoint is an airport, and the flight crew did not select a runway.
	The origin or destination waypoint is a runway, and the flight crew selected an ND range above, or equal to 160 NM.

L12

	The origin or destination waypoint is a runway, and the flight crew selected an ND range below 160 NM. The dimension of the runway symbol is proportional to the actual runway length, and is adjusted according to the selected ND range.

L2 The FMS corrects the altitude of the destination waypoint, in accordance with the destination temperature that the flight crew enters on the APPR panel of the ACTIVE/PERF page.

L1 PSEUDO WAYPOINTS

The VD displays the following types of pseudo waypoints:

	In NAV and managed speed modes, indicates the starting point of an acceleration or deceleration segment, as computed by the FMS. In HDG/TRACK and managed speed modes, indicates the point at which the flight crew must change the speed due to the speed limit, while maintaining the selected track.

L12

	Indicates the predicted start of an automatic deceleration, for an approach in a managed speed mode. Appears when: - NAV mode is engaged, or - NAV mode is armed, and the FMS predicts NAV mode engagement before the deceleration point.
	Indicates the predicted point at which the flight crew should start the deceleration, for an approach in a selected speed mode.
	The aircraft speed and/or altitude are too high to enable deceleration at the location of this point, while maintaining the approach vertical profile.

	Indicates the predicted location of the time marker along the F-PLN route. For more information about time markers, *Refer to DSC-22-FMS-10-80 Time Function*.
	Indicates the location of the Equi-Time Point (ETP) along the F-PLN route.

Ident.: DSC-31-CDS-40-50-10-00019829.0001001 / 02 OCT 14

VERTICAL CUT

The vertical display takes into account a vertical cut along the aircraft trajectory or a selected azimuth, in order to display terrain, weather, and safety altitudes.

The vertical cut runs along:

- The active flight plan or the LS beam, if the aircraft is in a managed mode, or

VIEW ALONG AZIM 200°

There are different ways of determining the width of the vertical cut, for the terrain display and the safety altitudes:

- If the vertical cut is defined along the active flight plan, the width used for the safety altitudes and the terrain display is equal to:
  - Two times the maximum EPU or FMS RNP, on the active leg
  - Two times the predicted RNP, on the other legs of the flight plan.
- If the vertical cut is defined along the aircraft track, the width is equal to:
  - Two times the TAWS RNP, for the terrain display
  - Two times the maximum EPU or FMS RNP, for the safety altitudes display.
- If the vertical cut is defined along an azimuth, the width is equal to two times the TAWS RNP, for the terrain display.

L3 For more information about the EPU and the FMS RNP, *Refer to DSC-34-NAV-20-10-60 Position Accuracy and Navigation Accuracy*.

L2 The width of the vertical cut for the terrain display cannot exceed 10 NM.
For the weather display, the WXR system considers a zero-width vertical cut.

Ident.: DSC-31-CDS-40-50-10-00000997.0001001 / 22 APR 14

TERRAIN PROFILE

L3 The TAWS computes the terrain elevation profile, along the vertical cut.

L1 BAROMETRIC HEIGHT

When the flight crew changes the barometric reference, the terrain profile is moved vertically, in order to keep the barometric height constant between the aircraft reference and the terrain profile.

Barometric Height

5000
4000
3000
2000
Baro height
1000 ft

L2 *Note: In polar zones, the TAWS cannot compute the terrain profile.*

L1 **RADIO HEIGHT**

Indicates the actual height of the aircraft above ground, as measured by the RA.
Appears when the aircraft RA height is less than 5 000 ft.

GREY AND MAGENTA AREAS

When the aircraft follows the active flight plan, and the direction of the route differs from the current heading by more than 3 °, the corresponding area of the VD is greyed over. The terrain displayed in this grey area does not correspond to the terrain that is located directly ahead of the aircraft.
The magenta area indicates the area where the TAWS stops displaying the terrain on the VD.

L2 In some cases, the FMS may not be able to compute a continuous trajectory for the display on the ND. This creates a gap (sometimes not visible) on the flight plan that is displayed on the ND. However, this has no impact on the guidance. In this case, the SURV stops displaying the terrain and the weather on the VD ahead of the gap, up to the destination runway.

WEATHER DISPLAY

L3 The WXR/PWS computes the weather display, along the vertical cut.

L1 The flight crew can press the WX pb on the EFIS CP to display the weather on the VD and the ND. The colors of the weather display are the same on the VD and the ND. The colors indicate the intensity of the precipitation (black, green, yellow, and red). Magenta indicates areas of turbulence, however these areas are not displayed on the VD. For more information about the color coding of the weather display, *Refer to DSC-34-SURV-30-20 ND*.

The flight crew can display the weather on the ND, according to a horizontal or oblique cut that is indicated on the VD as follows:

Indicates the altitude of the horizontal cut.

To select this altitude, the flight crew can:
- Pull the ELEVN knob on time on the WXR panel, or
- Use the ELEVN option on the CONTROLS page of the MFD.

Indicates the angle of the oblique cut.

To select this angle, the flight crew can:
- Pull the ELEVN knob two times on the ELEVN panel
- Use the TILT option on the CONTROLS page of the MFD.

L2 *Note: In polar zones, the WXR is not able to compute the weather display.*

Ident.: DSC-31-CDS-40-50-10-00000994.0001001 / 22 APR 14

SAFETY ALTITUDE

Safety altitudes are the minimum altitudes above which the aircraft can be safely operated.

The FMS database provides the following safety altitudes:
- Grid MORAs, or
- MSAs.
  MSAs are only displayed when the flight crew selects a departure, or an arrival procedure (SID, TRANS, or APPR) in the FMS.

The FMS computes the safety altitudes along the aircraft trajectory, up to the VD range.

Note: Grid MORAs on the VD and on the charts may be slightly different, due to the fact that the grid used in the FMS navigation database may be smaller than the grid in the charts.

L2 Grid MORAs are also displayed on the ND. However, the ND displays the highest grid MORA within a circular area of 40 NM radius around the aircraft. For more information, *Refer to DSC-31-CDS-40-40-80 MORA or Offset*.

MORA on VD

L1 **SAFETY ALTITUDE PROFILE**

When the safety altitude value is within the vertical scale of the VD, the safety altitude profile is displayed on the VD, as a dashed magenta line.

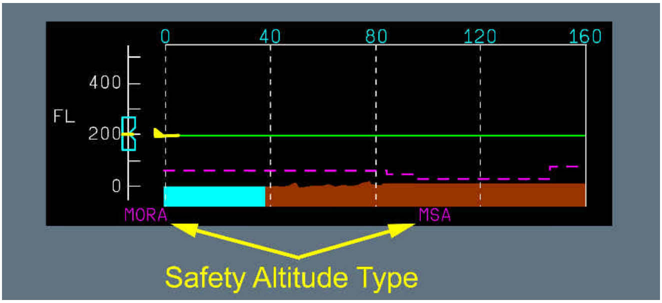
L2 When the barometric reference is STD, the safety altitude profile is only available when:
- The aircraft is within 100 NM of the departure airport, or
- The aircraft is within 100 NM of the destination airport, and the flight crew entered a QNH value in the FMS PERF/APPR page, or
- The aircraft is within 200 NM of the destination airport in DES or APPR phase, and the flight crew entered a QNH value in the FMS PERF/APPR page.

Safety altitudes are not available in manual AZIM mode, because they are only related to the flight path of the aircraft.

L1 Labels are displayed along the VD range in order to identify the type of safety altitude currently displayed (MORA or MSA).

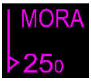
The MORA or MSA labels appear:
- At the top of the VD, when the aircraft is below the safety altitude, or
- At the bottom of the VD, when the aircraft is above the safety altitude.

Safety Altitude Type



When a part of the safety altitude profile goes beyond the vertical scale of the VD, the corresponding segments are not displayed. Only the value of the highest safety altitude is displayed instead.

SAFETY ALTITUDES OUTSIDE THE VD VERTICAL RANGE



Appears when none of the safety altitudes is within the vertical scale of the VD.
Indicates the type and the value of the highest safety altitude along the VD range.

Appears on the:
- Upper part of the VD, when the aircraft is below the highest safety altitude, or
- Lower part of the VD, when the aircraft is above the highest safety altitude.

When the barometric reference is STD, the numerical value of the highest safety altitude is given in FL.

When the barometric reference is QNH, the numerical value of the highest safety altitude is given:
- In feet, when the safety altitude is an MSA, or
- In hundreds of feet, when the safety altitude is a MORA.

Safety Altitudes Outside the VD Vertical Range

FMS MESSAGES

SAFETY ALTS PARTLY DISPLAYED	Appears when the safety altitude type and/or numeric values are not available.
TRAJ NOT AVAIL	Appears when: - The VD MODE CHANGE or the VD RANGE CHANGE message is displayed for more than 6 s, or - The ground speed is not valid, or - The FMS trajectory is not available.

DISPLAY MESSAGES

L12

ATT	Appears if one of the following parameters is not valid: - The angle of attack, or - The flight path angle, or - The pitch angle. Temporarily flashes, then remains steady.
VD MODE CHANGE	Appears when the flight crew changes the ND mode, and the new display is being prepared.
VD RANGE CHANGE	Appears when the flight crew changes the ND range, and the new display is being prepared.

L13

VIEW ALONG ACFT TRK	Appears when the vertical cut for the VD is defined along the aircraft track, but the ND does not display a track line.

Note: *Appears:*

- *In managed mode, when the aircraft deviates from the flight plan or from the LS beam, or*
- *During the transition from HDG to LOC mode, or*
- *When the GA TRK mode is engaged, or*
- *When the aircraft flies a manual leg, or*
- *At takeoff, when there is no ILS associated with the runway.*
  In this case, the RWY mode does not engage, and the VD also displays the flight path arrow. The VD recovers the flight plan trajectory after a few seconds, when NAV, RWY, TRACK, or HDG mode is engaged.

in Hg
hPa
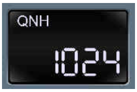
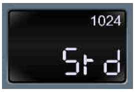
Barometric Reference Window
Barometric Reference Controls

BAROMETRIC REFERENCE WINDOW

L12



The barometric reference is set to QNH and the QNH value is 1 024 hPa.
The minimum QNH value that can be selected is 745 hPa (22.00 inHg) and the maximum is 1 100 hPa (32.48 inHg).

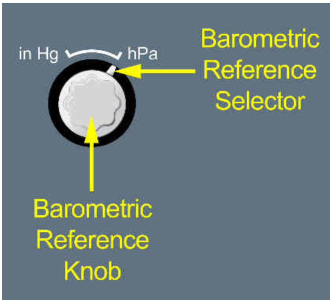


The barometric reference is set to STD.
If the flight crew selects the QNH barometric reference, the QNH is automatically set to the preset value, i.e. 1 024 hPa.

BAROMETRIC REFERENCE CONTROLS

The barometric reference controls have an outer selector, and an inner knob.

Barometric Reference Controls



in Hg
hPa
Barometric Reference Selector
Barometric Reference Knob

The flight crew uses the barometric reference selector to select the barometric unit (hectoPascal or inches of mercury).

L2 *Note: The PFDs and the VDs do not display the selected barometric unit.*

L1 The flight crew turns the barometric reference knob to select the QNH value.
The flight crew pulls or pushes the barometric reference knob to select the barometric reference (QNH or STD).
When the flight crew pushes the barometric reference knob, the barometric reference is set to STD. When in STD, the flight crew can turn the barometric reference knob to preset a QNH value.
When the flight crew pulls the barometric reference knob, the barometric reference is set to QNH.

L2 *Note: The selected QNH value appears in the barometric reference window, and under the altitude scale on the PFD.*

At the EFIS CP power-up, the barometric reference is QNH and the QNH value is set to 1 013 hPa or 29.92 inHg, depending on the selected barometric unit.

Ident.: DSC-31-CDS-40-60-10-00001038.0001001 / 07 MAY 18

VV PB

	The CAPT(F/O) PFD displays the Velocity Vector (VV).
	The CAPT(F/O) PFD does not display the VV.

When TRK-FPA is selected, both PFDs automatically display the Flight Path Vector (FPV).
L3 When TRK-FPA is selected, pressing the VV pb has no effect: Both PFDs continue to display the FPV, and the VV light remains on.
L1 When HDG-V/S is selected, the PFDs do not automatically display the VV. However, to display the VV on their PFD, the Captain(First Officer) can press the VV pb.

The PFDs no longer display the FPV(VV), when:
- The flight crew changes from TRK-FPA to HDG-V/S
  For more information about the HDG-V/S / TRK-FPA selection, *Refer to DSC-22-FG-70-30-20 HDG-V/S / TRK-FPA Selection*.
- The flight crew performs a go-around.

Ident.: DSC-31-CDS-40-60-10-00001040.0001001 / 22 APR 14

LS PB

L12

The CAPT(F/O) PFD displays the following landing system data in accordance with the approach selected on the FMS ARRIVAL page: Deviation scales, deviation signals, course pointer, information.
For more information about the landing system data, *Refer to DSC-31-CDS-40-20-110 Departure and Approach Guidance*.
If the flight crew selected an approach compatible with the FLS, the FMA displays the FLS capability, if the flight phase is descent or approach.
The FLS capability does not appear, if the NO FLS FOR THIS APPR message appeared on the MFD.

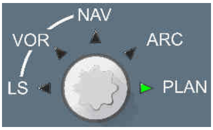
Note:
1. *If the direct distance to the destination airport is more than 300 NM, only the deviation scales appear.*
2. *The LS light automatically comes on when LOC, LOC B/C or F-LOC arms.*

The CAPT(F/O) PFD does not display the landing system data.

Ident.: DSC-31-CDS-40-60-10-00001042.0001001 / 22 APR 14

ND MODE SEL

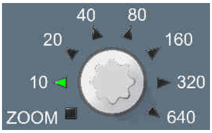
L12



For navigation purposes, the flight crew can select one of the following display modes:
- PLAN mode
  For more information, *Refer to DSC-31-CDS-40-40-30 PLAN Mode Overview*.
  If the flight crew selects the PLAN mode, the ND does not display terrain, weather, or traffic information.
- ARC mode
  For more information, *Refer to DSC-31-CDS-40-40-20 ARC Mode Overview*.
- ROSE-NAV mode
  For more information, *Refer to DSC-31-CDS-40-40-40 ROSE-NAV Mode Overview*.
- ROSE-VOR mode
  For more information, *Refer to DSC-31-CDS-40-40-50 ROSE-VOR Mode Overview*.
- ROSE-LS mode.
  For more information, *Refer to DSC-31-CDS-40-40-60 ROSE-LS Mode Overview*.

Ident.: DSC-31-CDS-40-60-10-00001044.0001001 / 22 APR 14

ND RANGE SEL



The ND range selector enables the flight crew to select the range of the ND and the VD.
For more information about the VD range, *Refer to DSC-31-CDS-40-50 Range*.

L2

In ARC mode, the ND range corresponds to the radius of the arc. In all ROSE modes and PLAN mode, the range corresponds to the diameter of the outer circle.

Thus, in order to keep constant the distance displayed ahead of the aircraft mock-up:
- The ND range is doubled when the flight crew changes the ND mode from ARC mode, to any ROSE mode or PLAN mode
- The ND range is divided by two when the flight crew changes the ND mode from any ROSE mode or PLAN mode, to ARC mode.

When the flight crew sets the ND range selector to ZOOM, the ND displays the airport moving map, and the VD is no longer available. For more information, *Refer to DSC-34-NAV-80-10 General*.

The ND can display the weather up to a range of 320 NM in ARC mode, and 640 NM in all ROSE modes.

Ident.: DSC-31-CDS-40-60-10-00001046.0004001 / 09 MAR 16

ND DATA DISPLAY

The flight crew can use the following pushbuttons to display the associated optional data on the ND and/or on the VD:

CAPT EFIS CP - ND Data Display

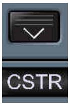
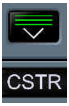
Weather
Traffic

CONSTRAINTS



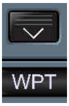
The ND does not display constraints.



The ND displays:

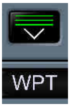
- The constraints associated with the flight plan waypoints
  Constraints consist in speed, altitude and time limitations. For more information, *Refer to DSC-31-CDS-40-40-80 Flight Plan Waypoints*.
- The Minimum Off Route Altitudes (MORA).
  When the flight crew selects a range that is less than 40 NM, the MORA value is no longer displayed on the ND. For more information, *Refer to DSC-31-CDS-40-40-80 MORA or Offset*.

WAYPOINTS



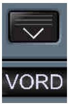
The ND does not display waypoints.

L12



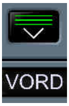
The ND displays all the waypoints stored in the navigation database and the pilot stored database.
The flight crew can only select one display at a time (WPT, VORD, or NDB ◁).

NAVAIDS



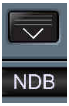
The ND does not display VORs and DMEs.

L12



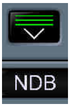
The ND displays all the VORs and DMEs stored in the navigation database and all the pilot stored navaids.
The flight crew can only select one display at a time (WPT, VORD, or NDB ◁).

NDBS ◁



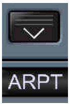
The ND does not display non-directional beacons.

L12

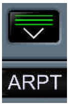


The ND displays all the NDBs stored in the navigation database.
The flight crew can only select one display at a time (WPT, VORD, or NDB).

AIRPORTS

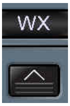


The ND does not display airports.



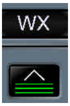
The ND displays all the airports stored in the navigation database, other than the origin or destination airports.

WEATHER



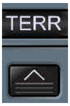
Neither the ND, nor the VD displays weather information.

L12



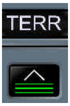
Both the ND and the VD display the weather.
The flight crew cannot display the weather and the terrain at the same time.
For more information, *Refer to DSC-34-SURV-30-20 ND*

TERRAIN



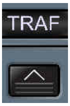
The ND does not display the terrain profile and the TAWS messages.

L12

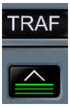


The ND displays the terrain profile and the TAWS messages.
The flight crew cannot display the weather and the terrain at the same time.
For more information, *Refer to DSC-34-SURV-20-20 ND*.

TRAFFIC

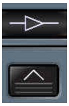


The ND does not display surrounding aircraft.

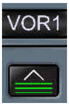


The ND displays all surrounding aircraft fitted with a transponder.
For more information, *Refer to DSC-34-SURV-40-20 ND*.

VOR1/ADF1 ◁

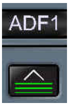


The ND does not display the VOR1 indications, nor the ADF1 indications.



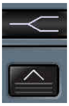
The ND displays the following elements associated with the selected VOR1:
- The VOR1 pointer
- The VOR1 station characteristics, on the lower left corner of the ND.

When pressed, the ND displays the ADF1 indications.

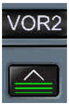


The ND displays the following elements associated with the selected NDB1:
- The ADF1 pointer
- The NDB1 station characteristics, on the lower left corner of the ND.

VOR2 ◁ /ADF2 ◁

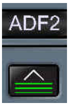


The ND does not display the VOR2 indications, nor the ADF2 indications.



The ND displays the following elements associated with the selected VOR2:
- The VOR2 pointer
- The VOR2 station characteristics, on the lower right corner of the ND.

When pressed, the ND displays the ADF2 indications.



The ND displays the following elements associated with the selected NDB2:
- The ADF2 pointer
- The NDB2 station characteristics, on the lower right corner of the ND.

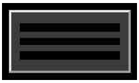
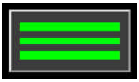
EFIS CP BACKUP BUTTON



The EFIS backup function is not active.
This is the default status.

L12



The CAPT(F/O) EFIS backup function is active.

- The CAPT(F/O) pressed the EFIS CP BACKUP, or
- The CAPT(F/O) pressed the FCU button (D6) on the left CKPT EQPT POWER SUPPLY, or
- The CAPT(F/O)'s EFIS CP is failed.

  Associated with one of the following alerts:
  - CDS CAPT (F/O) EFIS CTL PNL FAULT , when the CAPT(F/O) EFIS CP is failed
  - CDS CAPT+F/O EFIS CTL PNL FAULT, when both EFIS CPs are failed.

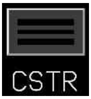
When the EFIS backup function is active:

- The last valid selections and values of the EFIS CP are recovered
- The corresponding CAPT(F/O) EFIS CP is not available, and the display is blank.

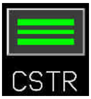
Ident.: DSC-31-CDS-40-60-30-00011557.0004001 / 09 MAR 16

ND DATA DISPLAY BUTTONS

CONSTRAINTS



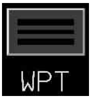
The ND does not display constraints.



The ND displays:

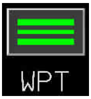
- The constraint associated with the flight plan waypoints
  Constraints are speed, altitude and time limitations. For more information, *Refer to DSC-31-CDS-40-40-80 Flight Plan Waypoints*.
- The Minimum Off Route Altitudes (MORA).
  If the flight crew selects a range that is less than 40 NM, the MORA value is no longer displayed on the ND. For more information, *Refer to DSC-31-CDS-40-40-80 MORA or Offset*.

WAYPOINTS



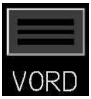
The ND does not display waypoints.

L12



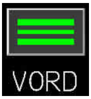
The ND displays all the waypoints that are stored in the navigation database and in the pilot stored database.
The flight crew can only select on display at a time (WPT, VORD, or NDB ◁✻).

NAVAIDS



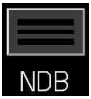
The ND does not display VORs and DMEs.

L12



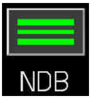
The ND displays all the VORs and DMEs of the navigation database and all the pilot stored NAVAIDS.
The flight crew can only select on display at a time (WPT, VORD, or NDB ◁✻).

NDB ◁✻



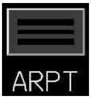
The ND does not display non-directional beacons.

L12

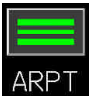


The ND displays all the non-directional beacons of the navigation database.
The flight crew can only select on display at a time (WPT, VORD, or NDB).

ARPT

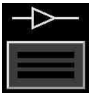


The ND does not display airports.

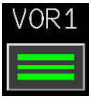


The ND displays all the airports of the navigation database, other than the origin or destination airports.

VOR1/ADF1 ◁

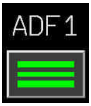


The ND does not display the VOR1 indications, nor the ADF1 indications.



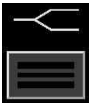
The ND displays the following VOR1 indications:
- The VOR1 pointer, on the heading scale
- The VOR1 station characteristics, on the lower left corner of the ND.

When pressed, the ND displays the ADF1 indications.

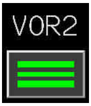


The ND displays the following ADF1 indications:
- The ADF1 pointer, on the heading scale
- The NDB1 station characteristics, on the lower left corner of the ND.

VOR2 ◁ /ADF2 ◁

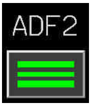


The ND does not display the VOR2 indications, nor the ADF2 indications.



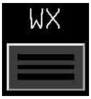
The ND displays the following VOR2 indications:
- The VOR2 pointer, on the heading scale
- The VOR2 station characteristics, on the lower right corner of the ND.

When pressed, the ND displays the ADF2 indications.



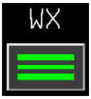
The ND displays the following ADF2 indications:
- The ADF2 pointer, on the heading scale
- The NDB2 station characteristics, on the lower left corner of the ND.

WEATHER



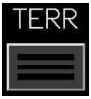
Neither the ND, nor the VD displays weather information.

L12



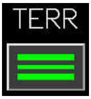
Both ND and VD display weather information.
The flight crew cannot display weather information and terrain at the same time.
For more information, *Refer to DSC-34-SURV-30-20 ND*.

TERRAIN



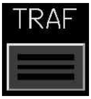
The ND does not display the terrain profile and the TAWS messages.

L12

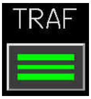


The ND displays the terrain profile and the TAWS messages.
The flight crew cannot display weather information and terrain at the same time.

TRAFFIC



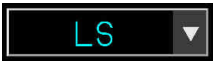
The ND does not display surrounding aircraft.



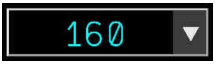
The ND displays all surrounding aircraft fitted with a transponder.
For more information, *Refer to DSC-34-SURV-40-20 ND*.

Ident.: DSC-31-CDS-40-60-30-00011558.0001001 / 22 APR 14

ND MODE AND RANGE



Indicates that the current ND mode is ROSE-LS.
The flight crew can select the ND mode via this field.



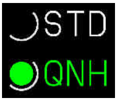
Indicates that the current ND range is 160 NM.
The flight crew can select the ND range via this field.

Ident.: DSC-31-CDS-40-60-30-00011560.0001001 / 22 APR 14

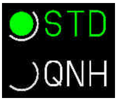
BAROMETRIC REFERENCE

L2 Contrary to the EFIS CP, the barometric reference preset is not available on the EFIS CONTROL PANEL page.

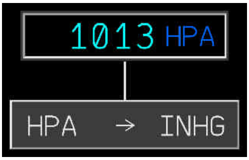
L1



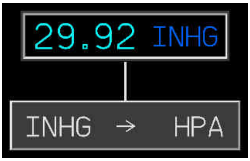
The barometric reference is set to QNH.



The barometric reference is set to STD.



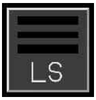
The barometric reference (QNH) is in hectopascal (HPA).
When pressed, changes to inches of mercury (INHG).



The barometric reference (QNH) is in inches of mercury (INHG).
When pressed, changes to hectopascal (HPA).

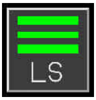
Ident.: DSC-31-CDS-40-60-30-00011563.0001001 / 22 APR 14

LS BUTTON



The CAPT(F/O) PFD does not display the landing system data.

L12

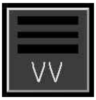


The CAPT(F/O) PFD displays the following landing system data in accordance with the approach selected on the FMS ARRIVAL page: Deviation scales, deviation signals, course pointer, information.
For more information about the landing system data, *Refer to DSC-31-CDS-40-20-110 Departure and Approach Guidance*.
If the flight crew selected an approach compatible with the FLS, the FMA display the FLS capability, if the flight phase is descent or approach.
The FLS capability does not appear if the NO FLS FOR THIS APPR message appeared on the MFD.

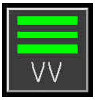
Note: 1. *If the direct distance to the destination airport is more than 300 NM, only the deviation scales appear.*
2. *The LS light automatically comes on when LOC, LOC B/C or F-LOC arms.*

Ident.: DSC-31-CDS-40-60-30-00011564.0001001 / 22 APR 14

VV BUTTON



The CAPT(F/O) PFD does not display the Velocity Vector (VV).



The CAPT(F/O) PFD displays the Velocity Vector (VV).

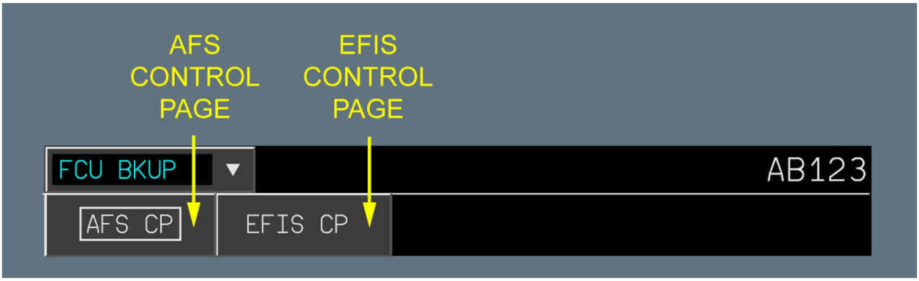
MFD - FCU BKUP PAGES

Ident.: DSC-31-CDS-40-60-00011339.0001001 / 22 APR 14
Applicable to: ALL

The FCU BKUP on the MFD has two pages:

- The AFS CP page
  The AFS CP page enables the recovery of all the AFS CP controls and indicators.
- The CAPT(F/O) EFIS CP.
  The CAPT(F/O) EFIS CP page enables the recovery of most of the CAPT(F/O) EFIS CP controls and indicators. However, the airport navigation function, the ETACS, and the preset barometric setting are no longer available.

FCU BKUP Pages



L2 When the flight crew selects the FCU BKUP via the MFD system menu, the FCU BKUP displays :

- The AFS CONTROL PANEL page, if the AFS CP backup function is active
- The EFIS CONTROL PANEL page, if the EFIS CP backup function is active on the onside MFD
- The AFS CONTROL PANEL page, if both the AFS CP backup function and the EFIS CP backup function are active on the onside MFD.

SHARED MESSAGE AREA

The shared message area displays messages in order to inform the flight crew about an event that is related to the FMS or ATC communication.
The shared message area displays the following messages:

D-ATIS RECEIVED	Indicates that a new ATIS report is received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.
D-ATIS GROUND MSG	Indicates that an ATIS FSM message is received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.
D-ATIS NO REPLY	Appears when the time-out (7.5 min) is reached and that no ATIS was received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.

D-ATIS SEND FAIL	Appears when an ATIS request failed for one of the following reasons: - The sending of the ATIS request failed, or - The time-out (6 min) for acknowledgement is reached, or - A negative answer for the ATIS request is received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.
CHECK FMS MESSAGE	Indicates that the FMS triggered an amber FMS message. Only appears if the MFD displays a page that is not an FMS page. Disappears when the flight crew accesses an FMS page.
L12	
IND	Indicates that both FMS operate in INDEPENDENT mode. For information about the INDEPENDENT mode, *Refer to DSC-22-FMS-40 INDEPENDENT Mode*.

L2 *Note:* *The shared message area displays only one message at a time. However, the IND message can appear in addition to another message.*

Ident.: DSC-31-CDS-40-60-20-00011341.0001001 / 22 APR 14

FLIGHT NUMBER

Indicates the flight number that the flight crew entered on the FMS ACTIVE/INIT page (*Refer to DSC-22-FMS-20-20-20 INIT Page*).

Intentionally left blank

EFIS CP BACKUP FUNCTION

Ident.: DSC-31-CDS-40-70-00003190.0001001 / 23 APR 14
Applicable to: ALL

When an EFIS CP fails, the flight crew can use the EFIS CONTROL PANEL page of the MFD as a backup.
When the EFIS CONTROL PANEL page becomes active, the page displays the last selections that were made on the onside EFIS CP.
For more information about the EFIS CONTROL PANEL page, *Refer to DSC-31-CDS-40-60 MFD - Overview*.

AUTOMATIC EFIS CP BACKUP ACTIVATION

If the CAPT(F/O) EFIS CP fails:
- The CDS CAPT (F/O) EFIS CTL PNL FAULT alert is triggered
- The CAPT(F/O) EFIS CP backup automatically activates.

If both EFIS CPs fail:
- The CDS CAPT+F/O EFIS CTL PNL FAULT alert is triggered
- The CAPT and F/O EFIS CP backups automatically activate.

MANUAL EFIS CP BACKUP ACTIVATION

If the flight crew detects a failure of an EFIS CP, the flight crew can activate the associated EFIS backup function via:
- The EFIS CP BACKUP button on the EFIS CONTROL PANEL page of the MFD
- The FCU button (D6) on the left CKPT EQPT POWER SUPPLY panel.

Intentionally left blank

OVERVIEW

Ident.: DSC-31-CDS-50-10-00018140.0001001 / 05 AUG 15
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

The Head-Up Display (HUD) provides flight data and guidance information in the flight crew's field of view. The flight data is superimposed on the outside view. As a result, the flight crew can adapt the flight to the external parameters (terrain, runway surface, clouds, etc.).
The HUD provides the flight crew with the same level of information as the information provided by the PFD.

Intentionally left blank

ARCHITECTURE

Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

HUD

There are two HUDs: One for the Captain and one for the First Officer.
Both HUDs are independent.

Each HUD includes all of the following:
- An HUD software that generates and manages the display of symbols
- A Head-up Projection Unit (HPU) that projects the symbols on the Head-up Combiner Unit (HCU)
- An HCU that superimposes the symbols on the outside view.

(Steady Position)

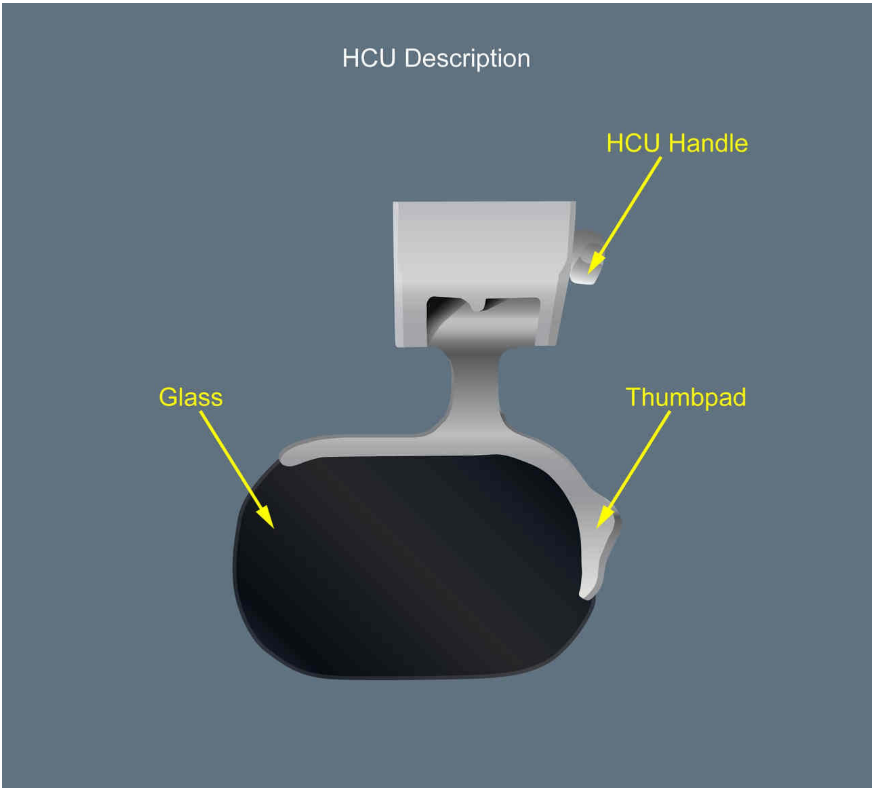
HCU Description



The HCU handle enables the flight crew to unlock or lock the HCU.

The HCU has all of the following positions:
- Stowed (steady position)
- Stop (intermediate position)
- Pre-operational (intermediate position)
- Operational (steady position)
- Breakaway stop (intermediate position)
- Locked breakaway (steady position).

The flight crew can see the flight data that appear on the HCU only if all of the following apply:

- The HCU is in the operational position
- The HCU handle is in the locked position
- The HUD is on.

Ident.: DSC-31-CDS-50-20-10-00018151.0001001 / 24 APR 14

HUD CP

The flight crew uses the HUD CP to adapt the HUD display to the flight conditions.
For more information, *Refer to DSC-31-CDS-50-40 HUD Control Panel*.

Ident.: DSC-31-CDS-50-20-10-00018152.0001001 / 24 APR 14

AFS CP

The flight crew uses the AFS CP for the flight guidance management.
For more information, *Refer to DSC-22-FG-90-20 Overview*.

Ident.: DSC-31-CDS-50-20-10-00018153.0001001 / 24 APR 14

EFIS CP

The flight crew uses the EFIS CP in order to:

- Display the landing system data via the LS pb
- Select the barometric reference
- Display the navaid information.

For more information, *Refer to DSC-31-CDS-40-60 EFIS CP*.

Deviation

When the aircraft is taxiing, the HUD displays:
- Less information, for better visibility of the external environment
- Additional information useful for aircraft lining up on the runway and Airport Navigation Function (ANF).

L2 The taxi mode appears, when the aircraft is on ground, and at a speed less than 40 kt.

L1 During taxi, the crosswind mode is not available.

Ident.: DSC-31-CDS-50-30-20-10-00018156.0001001 / 24 APR 14

GROUND SPEED

L3 The ADIRS use the GNSS/GPS and the IRS data for GS computation.

L1

	Indicates the current Ground Speed (GS) in knots.

Ident.: DSC-31-CDS-50-30-20-10-00018157.0001001 / 02 OCT 14

LOC DEVIATION

Indicates the LOC deviation related to the selected ILS.

Enables the flight crew to check that:
- The aircraft lined up on the selected runway in the FMS
- The lateral guidance is available.

L3 The MMR provides the LOC deviation information.

L1

	The LOC deviation is within the scale.
	The LOC deviation is outside the scale.
	The flight crew selected a LOC back course departure.
	The flight crew selected a LOC departure compatible with the FLS function.
	The MMR is on standby.

L12

LOC	Appears, instead of the LOC scale, if the LOC scale is not available. Temporarily flashes, then remains steady.

L12

LOC F-LOC	Appears, instead of the LOC scale, if the MMR sends inconsistent information. Temporarily flashes, then remains steady.

Aircraft Reference

On ground, the takeoff mode provides useful information for the lateral control of the aircraft in low visibility conditions.
As soon as the flight crew sets the takeoff thrust, the takeoff mode appears on the HUD, regardless of the previous mode.
In the takeoff mode, the flight crew cannot use neither the crosswind mode nor the declutter mode.
L2 The takeoff mode disappears, when the aircraft is above 50 ft RA.

Ident.: DSC-31-CDS-50-30-20-20-00018161.0001001 / 24 APR 14

AIRCRAFT REFERENCE

L12

Indicates the aircraft axis, as a reference for the yaw bar.
Appears on the ground, when the flight crew engages the FD.

Ident.: DSC-31-CDS-50-30-20-20-00018162.0001001 / 24 APR 14

FD YAW BAR

L3 The PRIMs provide the FD yaw orders.

L1

Indicates the required rudder input in order to maintain the aircraft on the runway centerline.

Appears when:
- The FD is engaged
- A Localizer (LOC) signal is available
- The mode RWY is active.

Indicates, if one engine fails during the takeoff, the required rudder input to maintain the aircraft on the runway centerline.

Ident.: DSC-31-CDS-50-30-20-20-00018163.0001001 / 02 OCT 14

LOC DEVIATION

Indicates the LOC deviation related to the selected ILS.

Enables the flight crew to check that:
- The lateral guidance is available in accordance with the tuned ILS
- The aircraft maintains the centerline of the runway selected in the FMS.

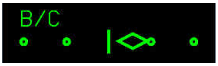
L2 Appears only when the LOC is aligned with the runway heading.

L3 The MMR provides the LOC deviation information.

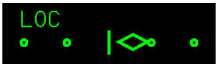
L1

The LOC deviation is within the scale.

The LOC deviation is outside the scale.



The flight crew selected a LOC back course departure.



The flight crew selected a LOC departure compatible with the FLS function.

	The MMR is on standby.

L12

LOC	Appears, instead of the LOC scale, if the LOC scale is not available. Temporarily flashes, then remains steady.

L12

LOC F-LOC	Appears, instead of the LOC scale, if the MMR sends inconsistent information. Temporarily flashes, then remains steady.

- The thrust levers are not set to TOGA or FLX/MCT detent.

L1 In the rollout or rejected takeoff mode, the flight crew cannot use neither the declutter mode nor the crosswind mode.

Ident.: DSC-31-CDS-50-30-20-30-00018168.0001001 / 24 APR 14

AIRCRAFT REFERENCE

L12

Indicates the aircraft axis, as a reference for the yaw bar.
Appears on the ground, when the flight crew engages the FD.

Ident.: DSC-31-CDS-50-30-20-30-00018169.0001001 / 24 APR 14

YAW BAR

L3 The PRIMs provide the yaw orders.

L1

Indicates the required rudder input in order to maintain the aircraft on the runway centerline.

Appears when:
- The FD is engaged
- A Localizer (LOC) signal is available
- The modes FLARE or ROLL OUT are active.

Ident.: DSC-31-CDS-50-30-20-30-00018170.0001001 / 02 OCT 14

LOC DEVIATION

Indicates the LOC deviation related to the selected ILS.

Enables the flight crew to check that:
- The lateral guidance is available in accordance with the tuned ILS
- The aircraft maintains the center line of the runway selected in the FMS.

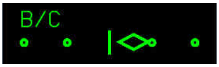
L2 Appears only when the LOC is aligned with the runway heading.

L3 The MMR provides the LOC deviation information.

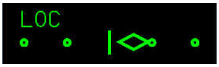
L1

The LOC deviation is within the scale.

The LOC deviation is outside the scale.



The flight crew selected a LOC back course departure.



The flight crew selected a LOC departure compatible with the FLS function.

The MMR is on standby.

L12	
LOC	Appears, instead of the LOC scale, if the LOC scale is not available. Temporarily flashes, then remains steady.
L12	
LOC F-LOC	Appears, instead of the LOC scale, if the MMR sends inconsistent information. Temporarily flashes, then remains steady.

Ident.: DSC-31-CDS-50-30-20-30-00018171.0001001 / 24 APR 14

GROUND SPEED

L3 The ADIRS use the GNSS and the IRS data for Ground Speed (GS) computation.

L1

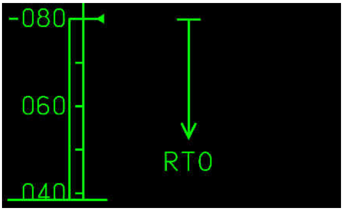
Indicates the current Ground Speed (GS) in knots.

Ident.: DSC-31-CDS-50-30-20-30-00018172.0003001 / 27 FEB 17

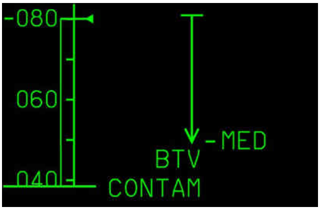
GROUND DECELERATION

L3 The IRS provide the ground deceleration information, based on the longitudinal deceleration of the aircraft. The BRAKES CTL provides the selected autobrake mode.

L1 When the aircraft decelerates, the deceleration arrow appears.
The length of the deceleration arrow varies with the current deceleration of the aircraft.
Below is a description of the additional information that appears when the flight crew selects an A/BRK mode.

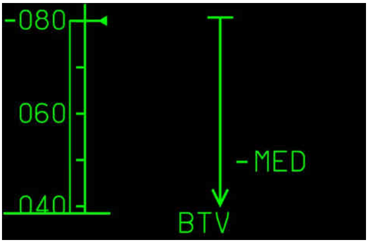


When the RTO mode is activated, RTO appears at the end of the deceleration arrow.



When the BTV CONTAM mode is activated:
- BTV CONTAM appears at the end of the deceleration arrow
- MED appears.

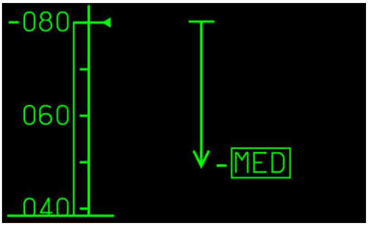
The MED indication can be used as a scale gradation to monitor the deceleration.



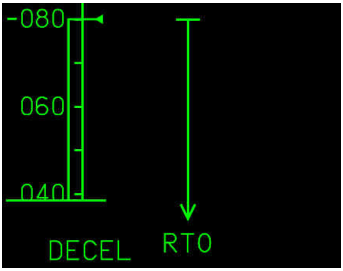
When the BTV mode is activated:

- BTV appears at the end of the deceleration arrow
- MED appears.

The MED indication can be used as a scale gradation to monitor the deceleration.



When the basic mode of the A/BRK is armed or activated, MED appears boxed.



When the deceleration reaches 80 % of the selected A/BRK mode (RTO, basic autobrake, or BTV), DECEL appears.

Note: *On a slippery runway, the A-SKID may be activated before the aircraft reaches the selected deceleration. Therefore, the DECEL indication may not appear, even if the autobrake is active.*

Ident.: DSC-31-CDS-50-30-20-30-00024907.0001001 / 08 JUL 19

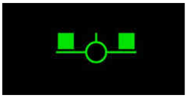
ENGINE REVERSER

The engine reverser symbol indicates the reverser status during rejected takeoff and rollout.

	Indicates the engine reverser is failed or not available.
	Indicates the engine reverser is fully deployed and operative.
	Indicates the transition phase between the engine reverser selection and the engine reverser availability.

Ident.: DSC-31-CDS-50-30-20-30-00024908.0001001 / 08 JUL 19

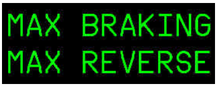
GROUND SPOILERS



Indicates the ground spoilers extension during rejected takeoff and rollout.

Ident.: DSC-31-CDS-50-30-20-30-00018429.0003001 / 27 FEB 17

MESSAGES



MAX BRAKING
MAX REVERSE

The MAX BRAKING and the MAX REVERSE messages appear simultaneously. For more information, *Refer to DSC-34-32-20-20-60 ROW/ROP Messages*.

MAX REVERSE

Only the MAX REVERSE message appears. For more information, *Refer to DSC-34-32-20-20-60 ROW/ROP Messages*.

MAX BRAKING

Only the MAX BRAKING message appears. For more information, *Refer to DSC-34-32-20-20-60 ROW/ROP Messages*.

Attitude

ATTITUDE

Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

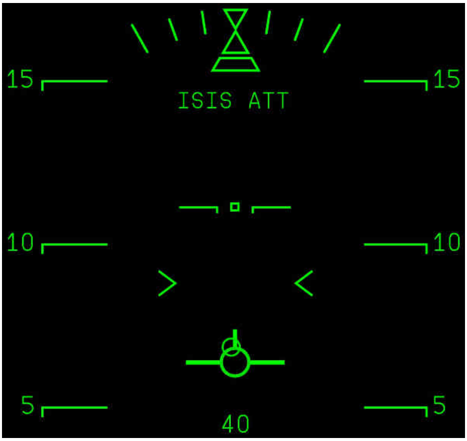
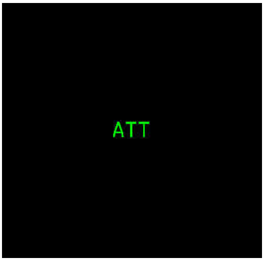
Horizon Line



Appears when the ISIS is the source of the attitude indication on the HUD.

L12



No attitude data is available. The attitude and guidance indications no longer appear. Temporarily flashes, then remains steady.

Ident.: DSC-31-CDS-50-30-30-10-00018175.0001001 / 08 JUL 19

AIRCRAFT REFERENCE

L12

Indicates the fixed reference position of the aircraft.

Appears, when the aircraft is:
- In normal mode or declutter 1 mode
- In declutter 2 mode, if the tail strike margin is below 1 °.

Ident.: DSC-31-CDS-50-30-30-10-00018174.0001001 / 03 JAN 19

HORIZON LINE

The horizon line:

- Indicates a zero degree pitch line/FPA information
- Provides a perception of the aircraft attitude.

L2 At high altitudes, the horizon line is above the earth's curve.
Appears as a dotted line, when the horizon line is outside the HUD field of view.

No longer appears if:
- The bank angle is beyond 71 ° to the left/right side, or
- The pitch attitude is more than 39 °, or less than -25 °.

L3 The ADIRS provide pitch and roll data that are necessary for the display of the horizon line.

L1 The horizon line has heading/track markers every 10 °.

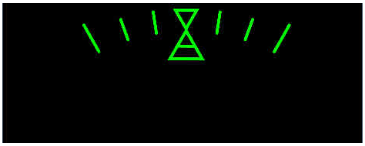
L2 The heading/track markers are not displayed when the ISIS inertial data is displayed. For more information about the display of the ISIS inertial data, *Refer to DSC-34-NAV-20-30 Display of ISIS Inertial Data*.

Ident.: DSC-31-CDS-50-30-30-10-00018176.0001001 / 03 DEC 15

BANK ANGLE

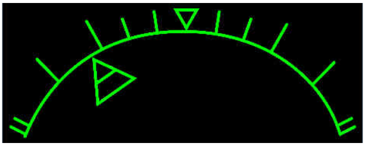
L2 The IRs provide the bank angle information.
In the case of a failure or a rejection of all IRs, the ISIS provides the bank angle information. For more information, *Refer to DSC-34-NAV-20-30 Display of ISIS Inertial Data*.

L1



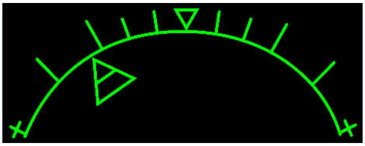
The bank angle of the aircraft is between 35 ° left or right.
Bank markers are indicated in increments of 10 ° up to 30 °.

L12



The bank angle of the aircraft is above 35 ° left or right.
The roll scale increases up to 67 ° left or right.
Bank markers appear at 45 ° and 60 °.
Indicates the bank angle protection limit in normal law.

L12



The bank angle of the aircraft is above 35 ° left or right, and the bank angle protection is lost. The aircraft is in alternate or direct law.
The roll scale increases up to 67 ° left or right.

L2 The roll scale and pointers no longer appear if:
- The pitch attitude exceeds 39 ° nose up, or 25 ° nose down, or
- The bank angle exceeds 71 ° left or right, or
- The aircraft is on ground.

Ident.: DSC-31-CDS-50-30-30-10-00018177.0001001 / 01 JUL 14

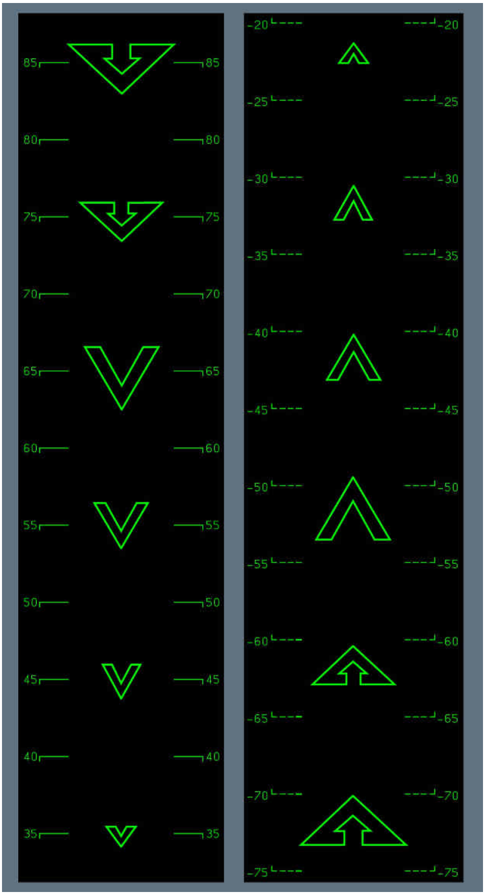
PITCH

L2 The IRs provide the pitch attitude and the FPA information.
In the case of a failure or a rejection of all IRs, the ISIS provides the pitch attitude information. For more information, *Refer to DSC-34-NAV-20-30 Display of ISIS Inertial Data*.

L1 The scale, associated with the aircraft reference and the Flight Path Vector (FPV), indicates the pitch attitude and the Flight Path Angle (FPA) of the aircraft.
Degrees are indicated in increments of 5 ° up to 90 ° nose up and 90 ° nose down. The horizon line indicates the zero reference of the pitch/FPA scale.

L2 Appears as dotted lines for negative values.

L1



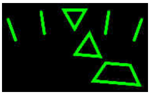
Indicates that the pitch attitude of the aircraft is excessive.
Shows the deviation of the pitch correction required.
Makers are displayed every 10 ° between 35 ° and 85 ° pitch up.
Makers are displayed every 10 ° between 22.5 ° and 72.5 ° pitch down.

Ident.: DSC-31-CDS-50-30-30-10-00018178.0001001 / 24 APR 14

SIDESLIP INDEX

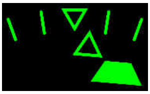
L3 The ADIRS provide the sideslip angle and the lateral acceleration.

L1



- On ground, indicates the aircraft lateral acceleration of the aircraft
- In flight, indicates the sideslip of the aircraft.

L13



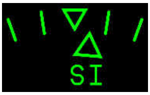
The PRIMs provide the beta target information.
Appears if one engine fails during takeoff, or go-around.
The sideslip index becomes the beta target.

Appears, when:

- The flight crew selects CONF 1, 2, or 3
- The N1 of the remaining engine is above 80 %
- The difference between the N1 of the engines is above 40 %.

For more information about the beta target, *Refer to DSC-27-10-30 Flight Law*.
The sideslip index also appears below the FPV.
For more information, *Refer to DSC-31-CDS-50-30-100 Flight Path Vector*.

L12



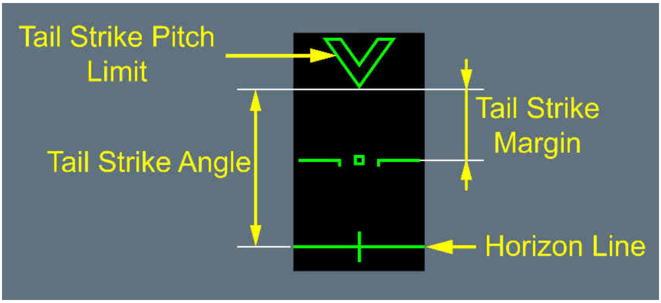
The sideslip and the lateral acceleration indications are not valid.
Temporarily flashes, then remains steady.

Ident.: DSC-31-CDS-50-30-30-10-00018179.0004001 / 08 APR 19

TAIL STRIKE PITCH LIMIT

L3 The PRIMs provide the tail strike limit indication.

Tail Strike



L1 Indicates the maximum pitch attitude, in order to avoid tail strike at landing.

L2 Pulses, if the tail strike margin is less than 1 °.
Appears, when the aircraft is below 400 ft RA, at a fixed value corresponding to the pitch limit with the main landing gear compressed.

No longer appears:

- When the ground speed is less than 50 kt, or
- 4 s after a go-around is initiated.

Airspeed

AIRSPEED

Ident.: DSC-31-CDS-50-30-40-00018146.0001001 / 24 APR 14
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

The following general airspeed indications appear during all flight phases:
- The speed reference line
- The airspeed target
- The speed trend arrow
- The Mach number (over the crossover altitude)
- Green dot speed (in clean configuration only).

For more information, *Refer to DSC-31-CDS-50-30-40 General Airspeed Indications*.

The following airspeed indications appear during specific flight phases:
- During takeoff:
  - V1
  - VR
  - V2
  - The short-term managed speed
  - VFE next
  - F speed
  - S speed
  - The automatic retraction speed.

  For more information, *Refer to DSC-31-CDS-50-30-40 Airspeed Indications during Takeoff*.
- During descent:
  - VFE next
  - F speed
  - S speed
  - The short-term managed speed
  - Lower and upper speed range limits.

  For more information, *Refer to DSC-31-CDS-50-30-40 Airspeed Indications during Descent*.
- After touchdown:
  - The DECEL indication.

  For more information, *Refer to DSC-31-CDS-50-30-40 Airspeed Indications After Touchdown*.

During flight, the airspeed scale also displays the following protection speeds:
- VMAX and the high speed protection indication
- VLS
- $V\alpha_{prot}$ (in normal law)
- $V\alpha_{max}$ (in normal law)
- $V\alpha_{sw}$ (in alternate and direct law).
  For more information, *Refer to DSC-31-CDS-50-30-40 Airspeed Protections*.

GENERAL AIRSPEED INDICATIONS

Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

Ident.: DSC-31-CDS-50-30-40-10-00018180.0001001 / 17 NOV 17

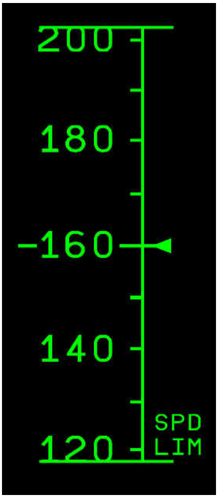
240
220
ISIS
SPD
.626
Airspeed Target
Speed Trend Arrow
Speed Reference Line
Green Dot Speed
Mach Number

The airspeed scale starts at 30 kt with markers every 10 kt. In addition, numeric values are displayed every 20 kt and start at 40 kt.

L12

SPD	Appears, instead of the airspeed scale, if no speed information is available. Temporarily flashes, then remains steady.

L12

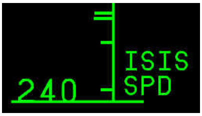


Appears if at least one characteristic speed is not available.

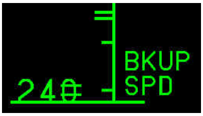
At least one of the following airspeeds no longer appears on the airspeed scale:

- VLS
- S speed
- F speed
- Green dot speed
- Speed trend arrow
- VFE next
- $V\alpha_{sw}$.

Temporarily flashes, then remains steady.



Appears when the ISIS speed indication is displayed on the HUD. For more information about the display of the ISIS speed, *Refer to DSC-34-NAV-20-30 Display of ISIS Speed and Altitude Indications*.



Appears when the backup speed indication (from FADECs and AOA probes) is displayed on the HUD. For more information about the backup speed indications, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.

Ident.: DSC-31-CDS-50-30-40-10-00018181.0001001 / 24 APR 14

SPEED REFERENCE LINE

L3 The ADRs provide the current airspeed value.

L1

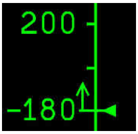
Indicates the current airspeed of the aircraft in knots.

Ident.: DSC-31-CDS-50-30-40-10-00018182.0001001 / 24 APR 14

SPEED TREND ARROW

L3 The PRIMs provide the speed trend information.

L12



Indicates the airspeed that the aircraft will reach in 10 s, if the current acceleration (deceleration) remains constant.
Appears, when the speed trend exceed 2 kt.
Disappears when the speed trend is less than 1 kt.

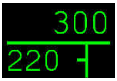
Ident.: DSC-31-CDS-50-30-40-10-00018183.0001001 / 24 APR 14

AIRSPEED TARGET

L3 The PRIMs provide the airspeed target information. If all three PRIMs are lost, the FCU backup provides the airspeed target information.

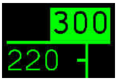
L1 Indicates the airspeed target, on the airspeed scale.

- The airspeed target is selected (manually on the AFS CP, or manually entered in the FMS)
- The airspeed target is within the airspeed scale.



- The airspeed target is selected (manually on the AFS CP, or manually entered in the FMS)
- The airspeed target is outside the airspeed scale.

- The airspeed target is managed (computed by the FMS)
- The airspeed target is within the airspeed scale.



- The airspeed target is managed (computed by the FMS)
- The airspeed target is outside the airspeed scale.

L12

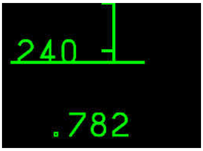
SPD SEL	The airspeed selected on the AFS CP is not available. Temporarily flashes, then remains steady.

Ident.: DSC-31-CDS-50-30-40-10-00018184.0001001 / 01 JUL 14

MACH NUMBER

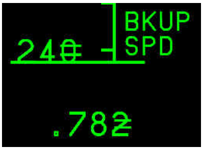
L3 The ADRs provide the Mach number information.

L1



Appears below the airspeed scale, when the Mach number exceeds M 0.5.
Disappears when the Mach number is less than M 0.45.

L12



Appears when the backup speed indication (from FADECs and AOA probes) is displayed on the HUD.
The accuracy of the Mach number is degraded, and the Mach number appears with a precision of ±M 0.03.
For more information about the backup speed indications, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.

L12

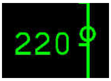
MACH	The Mach number is not available. The Mach flag appears instead of the Mach number. Temporarily flashes, then no longer appears.

Ident.: DSC-31-CDS-50-30-40-10-00019655.0001001 / 24 APR 14

GREEN DOT SPEED

L3 The PRIMs provide the green dot speed.

L1



Appears in clean configuration only.
For more information about the green dot speed, *Refer to DSC-22-27-10-20 GREEN DOT*.

AIRSPEED INDICATIONS DURING TAKEOFF

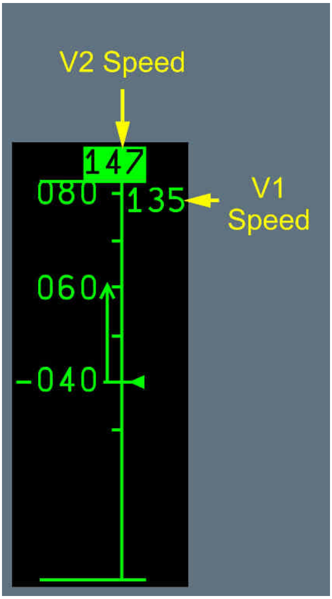
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

Ident.: DSC-31-CDS-50-30-40-20-00018185.0001001 / 24 APR 14

BEFORE LIFTOFF

L3 The FMS provides the values of V1, VR, and V2 that the flight crew entered.

L1



Until the aircraft reaches a sufficient speed, V1 and V2 are outside of the airspeed scale. Only the values are displayed at the top of the airspeed scale.
For more information about V1, *Refer to DSC-22-27-10-20 V1*.
For more information about V2, *Refer to DSC-22-27-10-20 V2*.

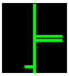
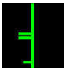
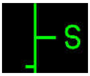
L123



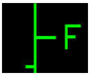
The PRIMs provide the speed range limits.
Indicates the range of aircraft speeds, that permits to maintain an appropriate vertical trajectory.
Appears during a managed descent only.
For more information about the upper and lower speed range limits, *Refer to DSC-22-FG-60-20 FMS Speed/Mach Target*.



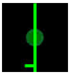
When the aircraft is below 20 000 ft, indicates the speed limit of the next flap configuration, also referred to as VFE next.
For more information about VFE next, *Refer to DSC-22-27-10-20 VFE NEXT*.



Appears when the FLAPS lever position is set to 1, also referred to as S speed.
For more information about S speed, *Refer to DSC-22-27-10-20 S*.



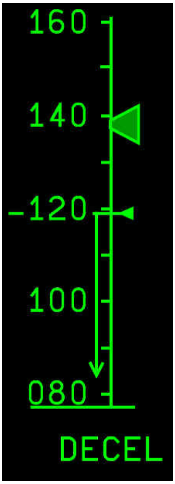
Appears when the FLAPS lever position is set to 2 or 3, also referred to as F speed.
For more information about F speed, *Refer to DSC-22-27-10-20 F*.



Indicates the short-term managed speed, when the speed is either managed or selected.
For more information about the short-term managed speed, *Refer to DSC-22-FG-60-20 Short-Term Managed Speed*.

AIRSPEED INDICATIONS AFTER TOUCHDOWN

Ident.: DSC-31-CDS-50-30-40-00018189.0001001 / 24 APR 14
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB



After touchdown, the only indications that appear on the airspeed scale are:
- The current airspeed
- The selected or managed speed before touchdown
- The speed trend arrow.

DECEL	The autobrake is active, and the aircraft decelerates. Appears below the speed scale, when the aircraft deceleration rate reaches at least 80 % of the selected deceleration. No longer appears when the aircraft deceleration rate is less than 70 % of the selected deceleration.

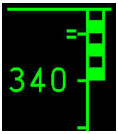
Note: *On a slippery runway, the A-SKID may be activated before the aircraft reaches the selected deceleration. Therefore, the DECEL indication may not appear, even if the autobrake is active.*

AIRSPEED PROTECTIONS

Ident.: DSC-31-CDS-50-30-40-00018190.0001001 / 24 APR 14
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

L3 The PRIMs provide speed protection information. If all three PRIMs are lost, the ADRs provide the VMO/MMO information.

L1 VMAX

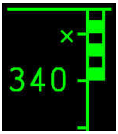


Indicates the VMAX speed, that is the lowest of the following speeds:
- VMO/MMO
- VLE
- VFE.

For more information about the VMAX definition, *Refer to DSC-22-27-10-20 VMAX*.

In normal law, when the aircraft reaches the speed marked with the symbol =, the high speed protection activates,

For more information about the high speed protection, *Refer to DSC-22-27-20 High Speed Protection*.

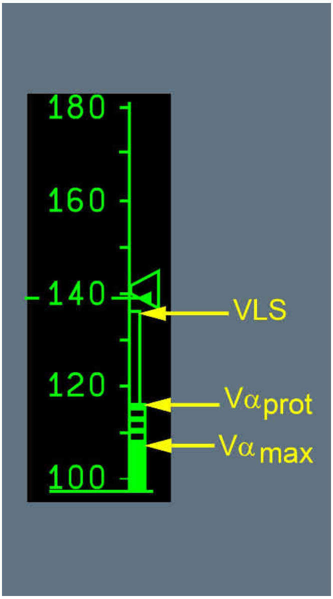


In alternate or direct law, the VMAX indication remains displayed, but the high speed protection is not available.

MINIMUM SPEEDS

MINIMUM SPEEDS IN NORMAL LAW

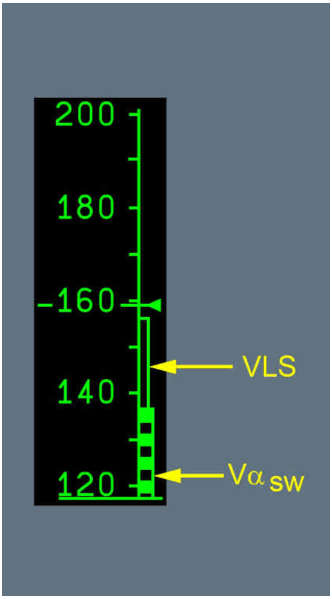
L12



The protection speeds, in normal law, are:

- The minimum selectable speed, also referred to as VLS
  For more information about VLS, *Refer to DSC-22-27-10-20 VLS*.
  No longer appears on ground.
- The alpha protection speed is also referred to as $V\alpha_{prot}$.
  For more information about $V\alpha_{prot}$, *Refer to DSC-22-27-10-20 V alpha prot*.
- The alpha max speed is also referred to as $V\alpha_{max}$.
  For more information about $V\alpha_{max}$, *Refer to DSC-22-27-10-20 V alpha Max*.

MINIMUM SPEEDS IN ALTERNATE LAW AND DIRECT LAW



The protection speeds in alternate law or in direct law, are:

- VLS
- The stall warning speed, also referred to as $V\alpha_{sw}$. For more information about $V\alpha_{sw}$, *Refer to DSC-22-27-10-20 V alpha sw*.

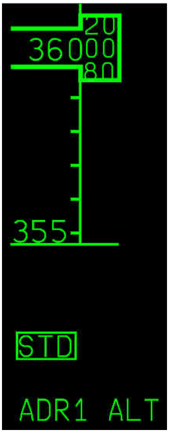
L12

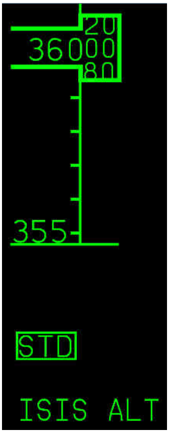
ALT	Appears, instead of the altitude scale, if the altitude data, with the reference selected on the AFS CP, is not available. Temporarily flashes, then remains steady.

L12



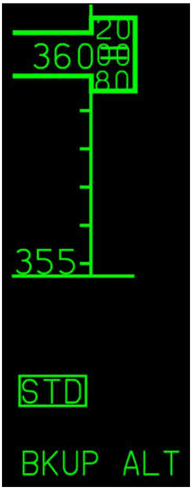
Appears on both HUDs when the altitude is based on only one ADR. The automatic monitoring rejected the other ADRs for altitude data. The required equipment for RVSM is not operative.
For more information about RVSM, *Refer to PRO-SPO-RVSM Required Equipment and Functions*.
For more information about the ADIRS monitoring, *Refer to DSC-34-NAV-20-10-50 ADIRS Monitoring*.

L12



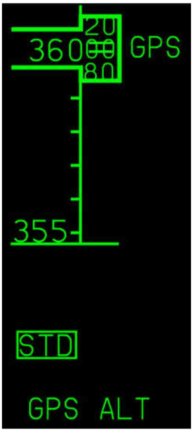
Appears when the ISIS altitude indication is displayed on the HUD. The required equipment for RVSM is not operative.
For more information about RVSM, *Refer to PRO-SPO-RVSM Required Equipment and Functions*.
For more information about the display of the ISIS altitude indication, *Refer to DSC-34-NAV-20-30 Display of ISIS Speed and Altitude Indications*.

L12



Appears when the backup altitude indication (from FADECs) is displayed on the HUD. The required equipment for RVSM is not operative.
For more information about RVSM, *Refer to PRO-SPO-RVSM Required Equipment and Functions*.
For more information about the backup altitude indications, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.

L123



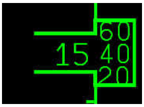
Appears when the ADRs, the ISIS, and the backup altitude (from FADECs) no longer provide the altitude. The backup GPS altitude is displayed on the HUD.
The backup GPS altitude remains available via the PRIMs.
The required equipment for RVSM is not operative.
For more information about RVSM, *Refer to PRO-SPO-RVSM Required Equipment and Functions*.

Ident.: DSC-31-CDS-50-30-50-10-00018191.0002001 / 01 MAR 17

CURRENT ALTITUDE

L3 The ADRs provide the current altitude information.

L12

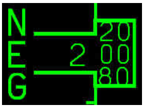


Indicates the current altitude in feet.

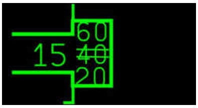
Pulses, when the difference between the current altitude and the selected altitude:
- Decreases
- Is between 200 ft and 750 ft.

Flashes, when the difference between the current altitude and the selected altitude:
- Increases
- Is above 200 ft.

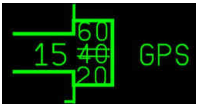
L1



The current altitude is negative.



The ADRs and the ISIS no longer provide the altitude. The backup altitude (from FADECs and AOA probes) is displayed. For more information about the display of the backup altitude, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.



The ADRs, the ISIS, and the backup altitude (from FADECs and AOA probes) no longer provide the altitude. The backup GPS altitude remains available via the PRIMs. The accuracy of the altitude is degraded, and the altitude appears with a precision around ±500 ft.

Ident.: DSC-31-CDS-50-30-50-10-00018192.0001001 / 02 OCT 14

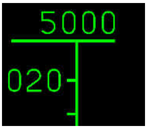
ALTITUDE TARGET

L3 The PRIMs provide the altitude target. If all three PRIMs are lost, the FCU backup provides the altitude target.

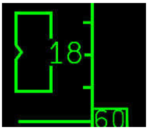
L1 Indicates:
- An Altitude, when the selected barometric reference is QNH, or
- A FL, when the selected barometric reference is STD.

L2 Appears on top of the altitude scale if the selected altitude is above the current altitude. Appears below the altitude scale if the selected altitude is below the current altitude.

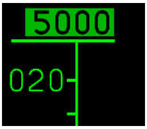
L1



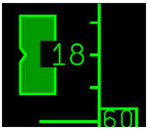
- Indicates the AFS CP selected altitude when the vertical guidance is selected
- The altitude target is outside the altitude scale.



- Indicates the AFS CP selected altitude when the vertical guidance is selected
- The altitude target is within the altitude scale.

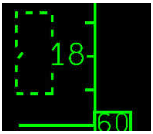


- Indicates an altitude constraint when the vertical guidance is managed
- The next altitude target is outside the altitude scale.



- Indicates an altitude constraint when the vertical guidance is managed
- The next altitude target is within the altitude scale.

L12



- Indicates the AFS CP selected altitude when the vertical guidance disregards the altitude target.
  This case occurs when a vertical approach mode is engaged and the aircraft descends through the missed approach altitude previously selected.
- The next altitude target is within the altitude scale.

L12

ALT SEL

Appears, instead of the altitude target value, if the following information cannot be displayed:
- The altitude that the flight crew selects on the AFS CP
- The altitude that the flight crew selects on the FCU backup page of the MFD
- The altitude constraint from the FMS.

Temporarily flashes, then remains steady.

Ident.: DSC-31-CDS-50-30-50-10-00018193.0001001 / 02 OCT 14

VERTICAL DEVIATION

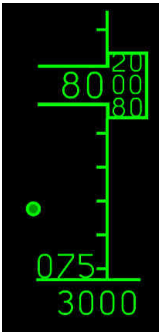
L3 The FMS provides the vertical deviation.

L1 The vertical deviation is the difference between the current altitude of the aircraft and the theoretical vertical profile of the FMS.

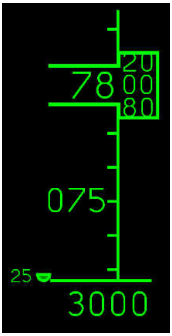
L2 The vertical deviation symbol appears when:
- The aircraft reaches the Top of Descent (T/D), or
- The FMS flight phase is descent, or approach.

The vertical deviation (VERT DEV) also appears on the DES and APPR panels of the FMS PERF page.

L1



When the vertical deviation is less than 570 ft, the vertical deviation symbol is a disk, located at the theoretical FMS altitude.



When the vertical deviation exceeds 570 ft, the symbol becomes a half disk, located at the altitude scale limits. In this case, it is associated with the numerical value displayed on two digits, in hundreds of feet.

L2 *Note:* *When the aircraft is in a holding pattern, the vertical deviation is the difference between the altitude of the aircraft, and the altitude of the holding exit. For more information, Refer to DSC-22-FMS-10-40-20 Purpose.*

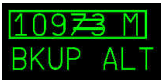
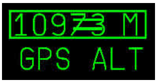
Selected Altitude
(in Meters)
Current Altitude
(in Meters)

L12



The ADRs and the ISIS no longer provide the altitude. The backup altitude (from FADECs) is displayed.
For more information about the display of the backup altitude, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.

L13



The ADRs, the ISIS, and the backup altitude (from FADECs) no longer provide the altitude. The accuracy of the altitude is degraded, and the altitude appears with a precision around ±500 ft.
The backup GPS altitude remains available via the PRIMs.

Ident.: DSC-31-CDS-50-30-50-10-00018195.0001001 / 04 MAY 16

BAROMETRIC REFERENCE

L3 The ADRs provide the selected barometric reference.

L1

The flight crew sets the barometric reference to QNH and select the barometric reference in hPa.

The flight crew sets the barometric reference to QNH and select the barometric reference in inches of mercury.

The flight crew sets the barometric reference to STD.

L2 Flashes, when the flight crew selected:
- QNH on the AFS CP, and the aircraft is in the climb phase, above the transition altitude, or
- STD on the AFS CP, and the aircraft is in the approach phase, below the transition flight level.

Note: *If the transition altitude (level) is not available from the FMS, the default transition altitude (level) is automatically set to 2 500 ft RA height.*

L1 For more information about the selection of the barometric reference, *Refer to DSC-31-CDS-40-60 Barometric Reference*.

If the automatic monitoring of air data rejects the altitude of the three ADRs, the ISIS provides the altitude information but cannot provide the barometric reference. The STD and QNH barometric references are not available. Only the pressure reference in hPa is displayed.

If the backup altitude is manually or automatically selected, only the STD barometric reference is available.
For more information about the display of the backup altitude, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.

Altitude Alerts

ALTITUDE ALERTS

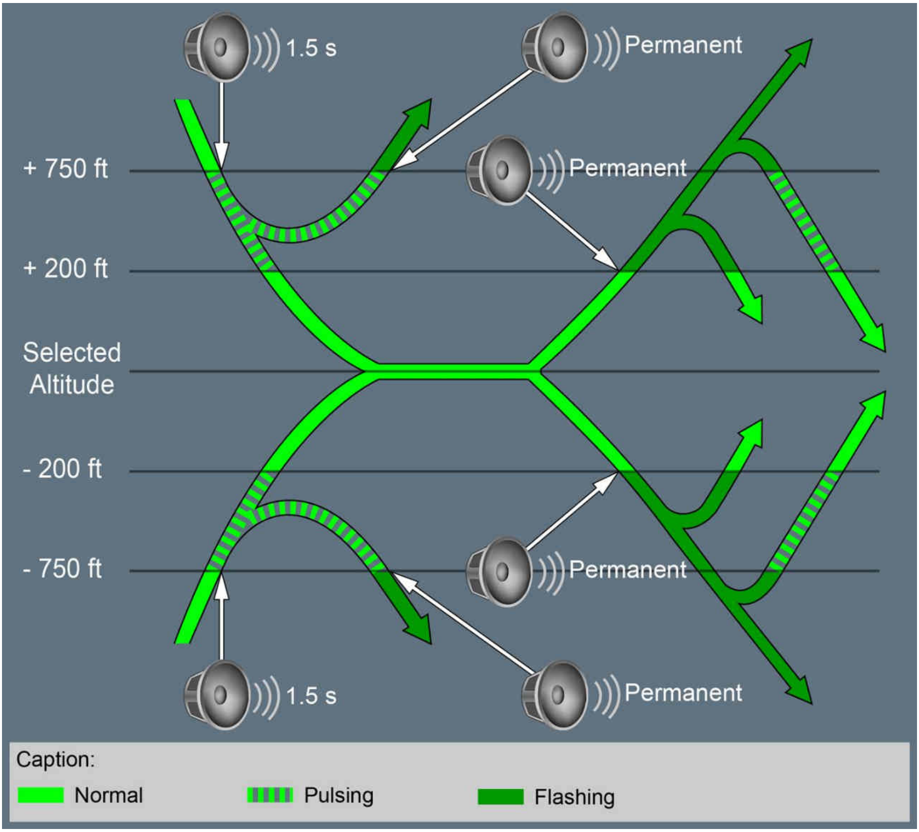
Ident.: DSC-31-CDS-50-30-60-00018148.0001001 / 24 APR 14
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

In manual flight, and when the aircraft reaches the selected altitude (flight level), or when the aircraft significantly deviates from the selected altitude (flight level), the ECAM generates an altitude alert:
- The altitude frame pulses, or flashes
- The C chord sound is generated.

C Chord Sound (Not available in PDF)

L3 The altitude alerts are triggered, when the altitude provided by the ADIRS is different from the altitude selected on the AFS CP.

Altitude Alerts



1.5 s

Pulsing
Flashing

L2 The C chord sound stops, when the flight crew:
- Selects a new altitude target, or
- Presses the EMER CANC pb on the ECAM CP, or
- Presses the MASTER WARN pb on the glareshield.

The altitude frame stops pulsing (flashing), when the flight crew selects a new altitude target.

This alert is inhibited:
- In approach, when the aircraft captures the glideslope, or
- When the landing gear is set to DOWN, and the slats are extended, or

- When the landing gear is locked down, or
- When the AP/FD TCAS mode engages upon a Resolution Advisory order.

Intentionally left blank

RA Height

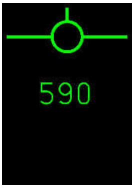
RA HEIGHT

Ident.: DSC-31-CDS-50-30-70-00018149.0001001 / 03 SEP 14
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

The RA height appears on the HUD when the aircraft height is less than 2 500 ft.

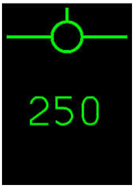
L3 The RA height value changes:
- Every 10 ft, above 50 ft
- Every 5 ft, between 5 ft and 50 ft
- Every foot below 5 ft.

L1

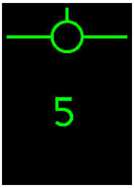


Indicates the RA height in feet, when the aircraft is:
- Below 2 500 ft
- Above 400 ft.

L12

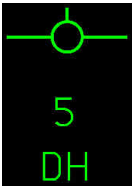


Indicates the RA height, when the aircraft is:
- Below 400 ft
- Above the minimum entered on the MFD (on the APPR panel of the FMS PERF page) +100 ft.
  Below 400 ft, the size of the RA height value increases.



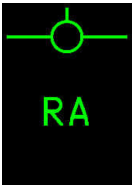
Appears when the aircraft is below:
- The minimum entered on the MFD (on the APPR panel of the FMS PERF page) +100 ft, or
- 400 ft, if the flight crew did not enter a minimum on the MFD (on the APPR panel of the FMS PERF page).

L12



Appears when the aircraft is below the minimum entered on the MFD (on the APPR panel of the FMS PERF page) .
Temporarily pulses, then remains steady.
Does not appear when the backup altitude (from FADECs and AOA probes) is manually or automatically selected. For more information, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.

L12



Appears when:
- The three radio altimeters (i.e. RA A, RA B, and RA C) are failed
- The STD barometric reference is not selected.

Temporarily flashes, then remains steady.

L2 The radio altitude indication no longer appears when:
- The aircraft is on ground with T.O power applied, or
- The aircraft is above 2 500 ft RA height.

Vertical Speed

VERTICAL SPEED

Ident.: DSC-31-CDS-50-30-80-00018150.0003001 / 26 JUL 17
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

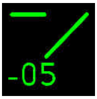
L2 The vertical speed indicated on the HUD is based on the barometric data from the ADRs and on inertial data from the IRs.

L1 The vertical speed scale ranges from -6 000 ft/min to 6 000 ft/min.

L3 *Note:* *In order to compute the baro inertial vertical speed, each IR mixes its own inertial data to the barometric data received from one ADR:*
- *In normal configuration, each IR uses its own ADR (IR 1 uses ADR 1, IR 2 uses ADR 2 and IR 3 uses ADR 3)*
- *The IR 1(2) changes its ADR source based on the ADR status (operative or failed), independently from the position of the AIR DATA and the ATT HDG selectors*
- *The IR 3 changes its ADR source based on the position of the AIR DATA and the ATT HDG selectors and on the ADR status (operative or failed).*

L2 If the baro inertial vertical speed from the IRs is no longer available, the ADRs provide the vertical speed based on a pure barometric vertical speed.

L12

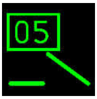


Indicates the vertical speed of the aircraft in hundred feet.

Note: *The digital indication only appears, when the vertical speed exceeds +/-200 ft/min.*
If the vertical speed exceeds +/-6 000 ft/min, the pointer remains on the top(bottom) of the scale.

Flashes, if the vertical speed:
- Equals, or exceeds +/-6 000 ft/min, or
- Exceeds -2 000 ft/min, and the aircraft is in descent between 2 500 ft and 1 000 ft , or
- Exceeds -1 200 ft/min, and the aircraft is in descent below 1 000 ft.

L12



- The vertical speed is no longer based on the baro inertial vertical speed from the IRs, but based on the barometric vertical speed from the ADRs, or
  There is a time lag between the vertical speed indication and the current vertical speed of the aircraft.
- The vertical speed is based on baro inertial data from the backup sources.

L12

The vertical speed information is not available.
This flag is located on the right side of the altitude scale, in front of the current altitude.
Temporarily flashes, then remains steady.

Heading/Track

HEADING/TRACK

Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

HEADING/TRACK SCALE

L3 The ADIRS provide the heading information.

L1 Appears on the horizon line, in the MAG or TRUE reference.
Headings are marked every 5 ° with a numeric value every 10 °.

L2 The heading/track scale is in the TRUE reference:
- When the flight crew presses the TRUE/MAG pb, on the AFS CP
- At high latitudes, when the ADIRS automatically change the MAG North reference to the TRUE North reference.

For more information about the polar navigation, *Refer to DSC-22-FMS-10-30-30 Introduction*.

L12

HDG	Appears at the bottom of the HUD instead of the heading scale, if the heading information is not available. Temporarily flashes, then remains steady.

L1 GPS TRK MESSAGE

L3 The ISIS provide the current GPS true track information.

L12

	Indicates the current GPS true track of the aircraft, on the heading/track scale, if the heading information is not available and the ISIS is selected as inertial source data. When displayed, the heading/track scale replaces the heading scale.

Ident.: DSC-31-CDS-50-30-90-10-00018202.0001001 / 24 APR 14

CURRENT HEADING

L3 The ADRs provide the heading value.

L1

	Indicates the current heading of the aircraft, on the heading scale. The heading value refers to true or magnetic north, depending on the MAG/TRUE pb selection.

Ident.: DSC-31-CDS-50-30-90-10-00018215.0001001 / 26 JUL 17

CURRENT TRACK

L3 The IRS provide the current track information.

L12

	Indicates the current track of the aircraft, on the heading/track scale. No longer appears, when the FPV is close to the horizon line, because the FPV also provides the track information.

Ident.: DSC-31-CDS-50-30-90-10-00018217.0001001 / 24 APR 14

SELECTED HEADING(TRACK)

L3 If all three PRIMs are lost, the FCU backup provides the selected heading(track) information. In all other cases, the PRIMs provide the selected heading(track) information.

L12

	Indicates the heading(track) that the flight crew selected on the AFS CP. Appears, when: - The HDG/TRACK mode is engaged, or - The APs and FDs are off.

L1

The selected heading(track) is outside the display area, the numerical value appears instead of the symbol on the right(left) side of the heading/track scale.

Ident.: DSC-31-CDS-50-30-90-10-00018218.0001001 / 24 APR 14

TRUE INDICATION

L123

The heading reference is TRUE north.

Appears when:
- The flight crew presses the TRUE/MAG pb, on the AFS CP
- At high latitudes, the ADIRS automatically change the MAG north reference to the TRUE north reference.

  The aircraft is at high latitude:
  - Above 82.5 ° North, or
  - Above 73.5 ° North, with a longitude between 117.5 ° West, and 92.5 ° West, or
  - Below 60.5 ° South.

  When the aircraft reaches high latitudes, the SELECT TRUE NORTH REF message appears on the ND, and requests that the flight crew selects the TRUE north reference.

Temporarily flashes, then remains steady when the slats are extended.
For more information about the polar navigation, *Refer to DSC-22-FMS-10-30-30 Introduction*.

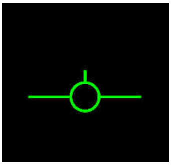
FLIGHT PATH VECTOR (FPV)

L3 The ADIRS provide the flight path angle required to display the FPV.

L12

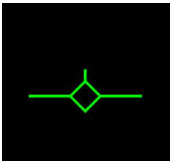


The FPV indicates:

- The Flight Path Angle (FPA) on the vertical axis
- The current track on the lateral axis.
  The current track is computed via the use of the hybrid position between IRS and GNSS/GPS. If the GPIRS position is not valid, the IRS provides the current track, and the FPV IRS message appears on the right lower part of the HUD.

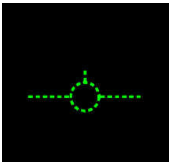
When both autopilots are not engaged, the FPV symbol shall be a circle with two horizontal lines (representing A/C wings) and one vertical line (representing A/C tail).

L1



When at least one autopilot is engaged, the FPV symbol shall be a diamond with two horizontal lines (representing A/C wings) and one vertical line (representing A/C tail).

L13

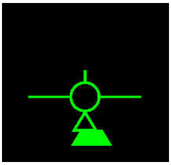


Appears as a dotted line at the edge of the display, if the FPV is outside the display area of the HUD.

The FPV is fixed at zero:

- On ground
- Under 60 kt.

L13



Appears when one engine fails during takeoff, or go-around.
The sideslip index then corresponds to the beta target.

Appears, when:

- The flight crew selects CONF 1, 2, or 3
- The N1 of the remaining engine is above 80 %
- The difference between the N1 of the engines is above 40 %.

L12

FPV IRS

The FPV only uses IRS data.
Temporarily flashes, then remains steady.

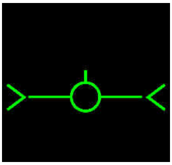
Ident.: DSC-31-CDS-50-30-100-10-00018221.0004001 / 29 JAN 19

ENERGY CHEVRONS

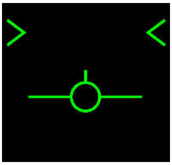
L3

The PRIMs provide the energy chevrons information.

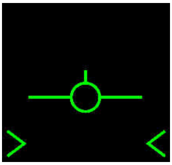
L1 Indicates the total energy of the aircraft. The position of the chevrons indicates if the aircraft accelerates, or decelerates on the current flight path.



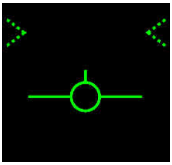
The aircraft is at a constant speed.



The aircraft will accelerate, if the flight crew maintains the current thrust and flight path.



The aircraft will decelerate, if the flight crew maintains the current thrust and flight path.



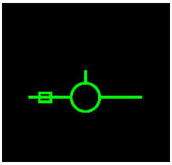
Appear as a dotted line:
- At the edge of the display, or
- When the FPV is outside the display area of the HUD.

Note: When the aircraft is on ground, during the taxi and the takeoff roll, the same symbol indicates the acceleration/deceleration of the aircraft.

Ident.: DSC-31-CDS-50-30-100-10-00018223.0003001 / 26 JUL 17

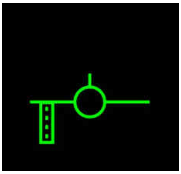
DELTA SPEED

The PRIM provides the delta speed.
Indicates the difference between the current airspeed and the selected or managed airspeed target.



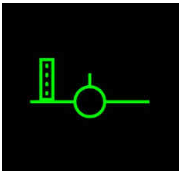
The current airspeed is equal to the airspeed target.

L12



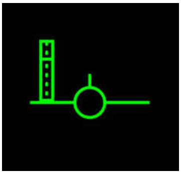
The current airspeed is less than the airspeed target, and the delta speed is less than or equal to 10 kt.
Each dot inside the vertical ribbon represents 2 kt.

L12

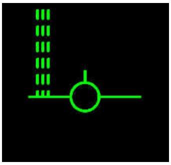


The current airspeed is more than the airspeed target, and the delta speed is less than or equal to 10 kt.
Each dot inside the vertical ribbon represents 2 kt.

L12



The current airspeed is more than the airspeed target, and the delta speed is more than 10 kt but below 20 kt.
Each dot inside the vertical ribbon represents 2 kt.

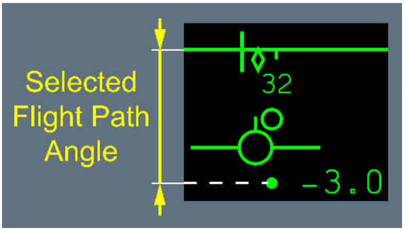


The current airspeed is more than the airspeed target, and the delta speed is more than 20 kt.

Ident.: DSC-31-CDS-50-30-100-10-00018224.0001001 / 24 APR 14

SELECTED FLIGHT PATH ANGLE

L123



Indicates the FPA that the flight crew selects on the AFS CP.

Appears, when:
- The flight crew selects TRK-FPA on the AFS CP
- The FD is engaged
-
  - The FPA mode is engaged, and the flight crew changes the selected FPA on the AFS CP, or
    The selected FPA appears for 5 s.
  - The FPA mode is not engaged, and the flight crew preselects the FPA value on the AFS CP.
    No longer appears when the FPA mode engages, or if any other AFS mode engages.

FD GUIDANCE

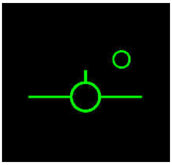
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

Ident.: DSC-31-CDS-50-30-100-20-00018222.0001001 / 02 OCT 14

FLIGHT PATH DIRECTOR (FPD)

L3 The PRIMs provide the FPD information.

L12



Indicates the AFS guidance in relation to the flight path vector.
Appears after liftoff, when the FD is engaged.

Temporarily pulses:
- After liftoff, or
- During a go-around.

Flashes, when one of the FD bars flashes on the PFD. For more information, *Refer to DSC-22-FG-30-50 Pitch and Roll Bar Flashing*.
Appears as a dotted circle at the edge of the display, if the FPD is outside the display area of the HUD.

No longer appears:
- If the attitudes of the aircraft are excessive, or
- During flare, except during autoland.

Intentionally left blank

Departure and Approach Guidance

APPROACH GUIDANCE

Ident.: DSC-31-CDS-50-30-110-00018586.0001001 / 06 NOV 14
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

The approach guidance indications on the HUD differ, when the aircraft performs:
- xLS approaches (*Refer to DSC-31-CDS-50-30-110 xLS Approaches*), or
- RNP AR/RNAV(RNP) approaches and RNAV departures (*Refer to DSC-31-CDS-50-30-110 RNP AR/RNAV(RNP) Departures And Approaches*).

For more information about the different approaches included in the xLS and RNP AR/RNAV(RNP) categories, *Refer to PRO-NOR-SOP-180-A Cross-Reference Table*.

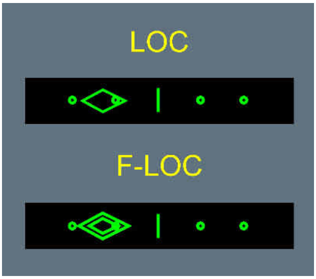
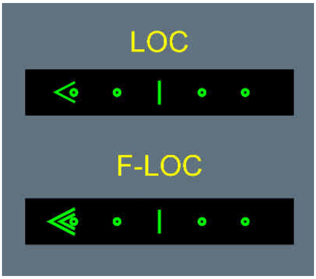
LOC OR F-LOC DEVIATION

L3 The MMR provides the LOC and F-LOC deviation.

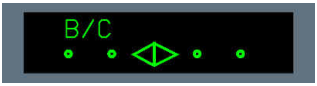
L1



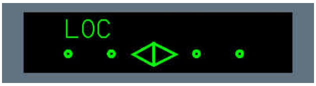
The LOC and F-LOC deviations are within the scale.



The LOC and F-LOC deviations are outside the scale.



The flight crew selected a back beam approach or a LOC back course departure .



The flight crew selected a LOC approach compatible with the FLS function.

If the deviation exceeds a quarter deflection, the deviation scale flashes and the LOC deviation symbol flashes when:
- The aircraft is below 1 000 ft down to 15 ft
- LAND1, LAND2, or LAND3 appears on the FMA
- LOC, LAND, or FLARE is engaged.

L2 For more information about the conditions of excessive deviation, *Refer to DSC-22-FG-100-20 Excessive Deviation Indication*.

L1 If the LOC transmitter fails:
- The LOC indexes disappear on both HUDs
- The LOC scales temporarily flash on both HUDs.

L2 The detection of the LOC transmitter failure is available between 1 000 ft and 15 ft, when the LOC mode is engaged.

For more information about the LS transmitter failure, *Refer to DSC-22-FG-100-20 Failure of the LS Transmitter*.

L12

LOC	Appears, instead of the LOC scale, if the LOC deviation is not valid. Temporarily flashes, then remains steady. For more information, *Refer to DSC-22-FG-100-20 Failure of one LS Receiver*.

L123

F-LOC	Appears, instead of the F-LOC scale, if the F-LOC deviation is not valid. The F-LOC deviation is not available if the FLS function of the MMR on the same side is lost. Temporarily flashes, then remains steady.

L12

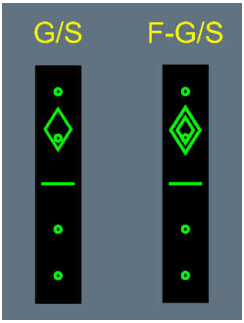
LOC F-LOC	Appears, instead of the LOC or F-LOC scale, if the MMR sends inconsistent information. Temporarily flashes, then remains steady.

Ident.: DSC-31-CDS-50-30-110-10-00018228.0001001 / 06 NOV 14

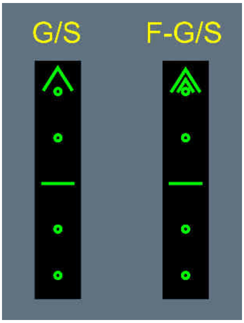
G/S OR F-G/S DEVIATION

L3 The MMR provides the G/S and F-G/S deviation.

L1



The G/S and F-G/S deviations is within the scale.



The G/S and F-G/S deviations is outside the scale.

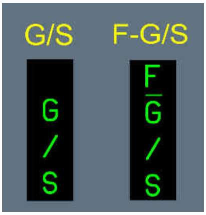
If the deviation exceeds a quarter deflection, the deviation scale flashes and the G/S deviation symbol flashes when:
- The aircraft is below 1 000 ft down to 100 ft
- LAND1, LAND2, or LAND3 appears on the FMA
- G/S, LAND, or FLARE is engaged.

L2 For more information about the conditions of excessive deviation, *Refer to DSC-22-FG-100-20 Excessive Deviation Indication*.

L1 If the G/S transmitter fails:
- The G/S indexes disappear on both HUDs
- The G/S scales temporarily flash on both HUDs.

L2 The detection of the G/S transmitter failure is available between 1 000 ft and 100 ft, when the G/S, LAND or FLARE mode is engaged.
For more information about the LS transmitter failure, *Refer to DSC-22-FG-100-20 Failure of the LS Transmitter*.

L1 *Note:* *During a LOC or LOC B/C approach flown with the FLS function, the lateral deviation symbol is a single diamond, as for an ILS approach.*



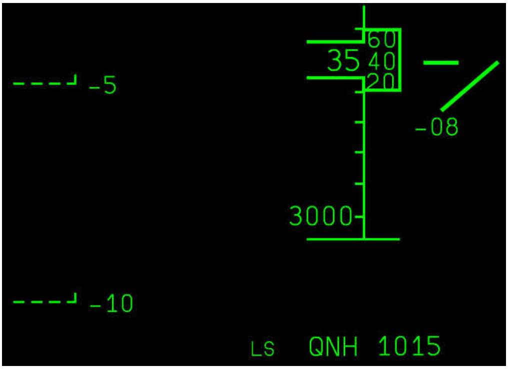
Appears, instead of the G/S or F-G/S scale, if the G/S or the F-G/S deviation is not valid.

Ident.: DSC-31-CDS-50-30-110-10-00019097.0001001 / 24 APR 14

LS REMINDER

L3 The MMR and the FMS provide the LS reminder information.

L12



Appears if:
- The flight crew selected an xLS approach
- The LS pb is set to off after the approach mode was armed or engaged.

Temporarily flashes, then remains steady.

Ident.: DSC-31-CDS-50-30-110-10-00018229.0001001 / 17 NOV 17

LS COURSE POINTER

L3 The MMR and the PRIM provide the LS course pointer information.

L1

Indicates the LOC course on the heading scale of the selected approach.

Indicates the F-LOC course on the heading scale of the selected approach.

L2 Appears, when the LS pb is set to on, for more information, *Refer to DSC-31-CDS-40-60 LS pb*.

Ident.: DSC-31-CDS-50-30-110-10-00018232.0003001 / 09 MAR 16

FINAL APPROACH FPA

L3 The FMS provide the necessary information to display the final approach FPA.

L1 The angle between the horizon line and the final approach FPA indicates the flight path angle of the final approach.

XLS APPROACH

When the LS pb is on, an LS label appears.

Appears during an ILS, GLS , or an approach compatible with the SLS function.
Indicates the flight path angle (or slope) of the final approach as stored in the FMS database.
When the aircraft is on the approach path, the final approach FPA is aligned with the touchdown point. For more information about the touchdown point, *Refer to DSC-31-CDS-50-30-110 Synthetic Runway*.

Appears during an approach compatible with the FLS function.
Indicates the flight path angle (or slope) of the final approach that the MMR provides.

RNP AR/RNAV(RNP) APPROACH

For more information, *Refer to DSC-31-CDS-50-30-110 Final Approach FPA*.

OTHER APPROACHES

The flight crew selected an FPA value via the FCU.
The selected FPA value is displayed.

The flight crew did not select an FPA value via the FCU.
The default value of the final approach FPA is displayed: -3 °.

Ident.: DSC-31-CDS-50-30-110-10-00018231.0001001 / 04 MAY 18

SYNTHETIC RUNWAY

L3 The ANF or the FMS, and the ADIRS provide the necessary information to display the synthetic runway.

L1 The synthetic runway illustrates the destination runway on the HUD. The shape and position of the synthetic runway vary in accordance with the position and attitude of the aircraft.
The touchdown point is also indicated on the synthetic runway.

L2 The touchdown point flashes when the vertical deviation is excessive.

L1 *Note:* *During an approach compatible with the FLS function:*
- *The synthetic runway is drawn with dashed lines*
- *The touchdown point does not appear.*

L2 The synthetic runway no longer appears:
- When the aircraft overflies the runway, or
- Below the minimum, or
- During flare, or
- During go-around.

Ident.: DSC-31-CDS-50-30-110-10-00018230.0001001 / 04 MAY 18

LOC AXIS

L3 The FMS, the PRIM, the MMR, and the ADIRS provide the necessary information to display the LOC axis.

L1 The LOC axis symbol:
- Indicates a perspective view of the LOC axis on the ground
- Gives an indication of the aircraft position in relation to the LOC axis.

L2 The LOC axis joins the threshold of the synthetic runway, or the anchor(end) point in the case of an approach compatible with the FLS function.

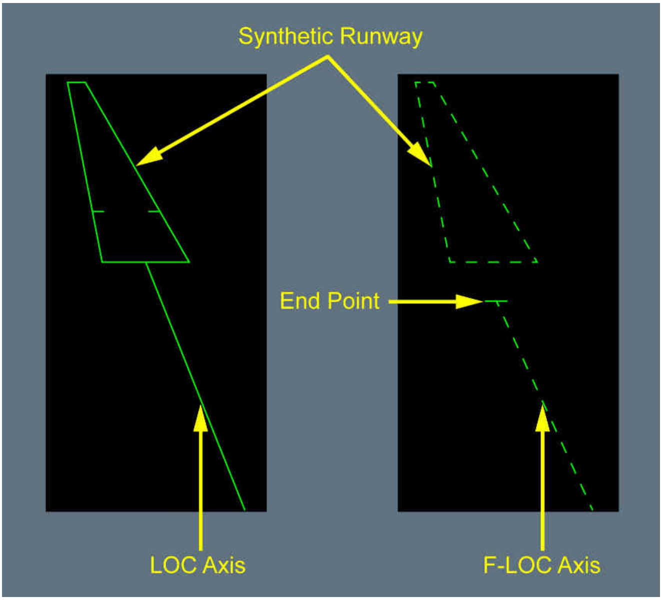
L1 *Note:* *During an approach compatible with the FLS function, the LOC axis appears as a dashed line.*

L2 Appears, when:
- The synthetic runway is displayed
- The LS pb is on.

Flashes, if the lateral deviation is excessive.

No longer appears:
- When the aircraft overflies the runway, or
- Below the minimum, or
- During flare, or
- During go-around.

LOC Axis

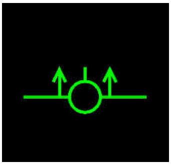


Ident.: DSC-31-CDS-50-30-110-10-00018226.0001001 / 06 NOV 14

FLARE REMINDER

L3 The RAs provide the radio altitude that is necessary for the display of the flare reminder.

L12



Indicates that it is necessary to flare.
Appears and pulses for 3 s, below 38 ft radio altitude.
No longer appears on ground.

Ident.: DSC-31-CDS-50-30-110-10-00018233.0001001 / 06 NOV 14

ILS MARKER

L3 The VOR 1 receiver provides the marker beacon information.

L2 Appears when:

- The LS pb is set to on
- The aircraft flies over the marker beacon.

L1

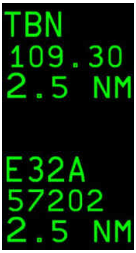
OM	The aircraft is over the outer marker of the ILS approach.
MM	The aircraft is over the middle marker of the ILS approach.
IM	The aircraft is over: - The inner marker of the ILS approach, or - An airway marker.

Ident.: DSC-31-CDS-50-30-110-10-00018234.0003001 / 28 APR 17

LS INFORMATION

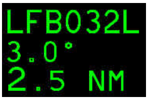
L3 The MMR, the DME, and the FMS provide the LS information.

L13



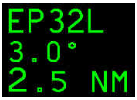
Indicates the following information about the ILS, GLS ◁ or an approach compatible with the SLS ◁ function:
- The ILS, GLS or SLS identification
  The MMR decodes the ILS identification.
- The ILS frequency or the channel of the GLS or the approach compatible with the SLS function
- The DME distance, if any.

L13



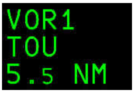
When the flight crew flies an approach with the FLS function, indicates:
- The FLS anchor point identification, when the anchor point is on the runway threshold
- The FLS beam slope
- The distance to the anchor point.
  The FMS computes this distance.

L1



When the flight crew flies an approach with the FLS function, indicates:
- The anchor point is not located on the runway threshold: In this case, the anchor point is also referred to as the End Point (EP)
- The FLS beam slope to the EP
- The distance to the anchor point.

L12



VOR1
TOU
5.5 NM

During a VOR or VOR/DME approach flown without the FLS function, indicates:
- The selected VOR receiver
- The VOR/DME ident
  If the VOR ident is not valid, the ND displays the VOR frequency instead.
  If the VOR frequency is not valid, the ND displays the DME frequency, if any.
  If nothing is displayed, it indicates that both the identifier and the frequency are not valid.
- The DME distance, if any.

L12

ILS

Appears during an ILS approach, if one of the following is not available:
- The LOC signal, or
- The G/S signal.

Temporarily flashes, then remains steady.

L12

GLS

Appears, if one of the following is not available during an GLS ◁ approach:
- The LOC signal, or
- The G/S signal.

Temporarily flashes, then remains steady.

L12

SLS

Appears, if one of the following is not available during an approach compatible with the SLS ◁ function:
- The LOC signal, or
- The G/S signal.

Temporarily flashes, then remains steady.

L12

FLS

Appears, if one of the following is not available:
- The FLS function, or
- The computed F-LOC signal, or
- The computed F-G/S signal, or
- The distance to the anchor point.

Temporarily flashes, then remains steady.

L12

LOC/FLS

Appears, if one of the following is not available:
- The LOC/FLS function, or
- The LOC signal, or
- The computed F-G/S signal, or
- The distance to the anchor point.

Temporarily flashes, then remains steady.

L12

DME	Appears, if: - The ILS has a DME - The DME distance is not available. Temporarily flashes, then remains steady.

RNP AR/RNAV(RNP) APPROACHES

Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

Ident.: DSC-31-CDS-50-30-110-20-00018893.0001001 / 06 NOV 14

To perform an RNAV(RNP) departure, the flight crew must:
- Select an RNAV(RNP) departure on the FMS DEPARTURE page
- Set the LS pb to off on the EFIS CP.

To perform an RNP AR/RNAV(RNP) approach, the flight crew must:
- Select an RNP AR/RNAV(RNP) approach on the FMS ARRIVAL page
- Set the APPR pb to on
- Set the LS pb to off on the EFIS CP.

Note: *The display enables to perform the RNAV(RNP) missed approach procedure associated with the RNP AR/RNAV(RNP) approach.*

1 LATERAL DEVIATION

L3 The FMS provides the lateral deviation (LDEV).

L1 Indicates the deviation relative to the lateral F-PLN profile.

The LDEV is within the scale.

The LDEV is outside the scale.

The maximum value of the LDEV is 0.2 NM either side.

L2 During approach, the LDEV scale and index flash when the FMS detects an excessive deviation that exceeds 1 x RNP of the current leg. There is no LDEV and index flash on departure or go-around.

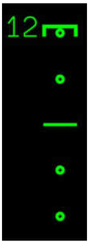
Ident.: DSC-31-CDS-50-30-110-20-00018896.0002001 / 01 MAR 17

VERTICAL DEVIATION

L3 The FMS provides the vertical deviation (VDEV).

L1 Indicates the deviation relative to the vertical F-PLN profile.

The VDEV is within the scale.



The VDEV is outside the scale.

The maximum value of the VDEV is 200 ft up and down.

L2 The VDEV scale and index flash when the FMS detects an excessive deviation of 3/4 dot (75 ft) below the vertical profile.

Ident.: DSC-31-CDS-50-30-110-20-00022183.0001001 / 06 NOV 14

FINAL APPROACH FPA

L3 The FMS provide the necessary information to display the final approach FPA.

L1 The angle between the horizon line and the final approach FPA indicates the flight path angle of the final approach.

RNP AR/RNAV(RNP) APPROACH

When the LS pb is off, the value of the flight path angle appears.

Indicates the flight path angle (or slope) of the final approach as stored in the FMS database.

XLS APPROACH

For more information, *Refer to DSC-31-CDS-50-30-110 Final Approach FPA*.

OTHER APPROACHES

The flight crew selected an FPA value via the FCU.
The selected FPA value is displayed.

The flight crew did not select an FPA value via the FCU.
The default value of the final approach FPA is displayed: -3 °.

Ident.: DSC-31-CDS-50-30-110-20-00022187.0001001 / 01 MAR 17

SYNTHETIC RUNWAY

L3 The FMS and the ADIRS provide the necessary information to display the synthetic runway.

L1 The synthetic runway illustrates the destination runway on the HUD. The shape and position of the synthetic runway vary in accordance with the position and attitude of the aircraft.

L2 The synthetic runway no longer appears:
- When the aircraft overflies the runway, or
- Below the minimum, or
- During flare, or
- During go-around.

Flight Mode Annunciator

FLIGHT MODE ANNUNCIATOR (FMA)

Ident.: DSC-31-CDS-50-30-120-00018245.0001001 / 24 APR 14
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

The Flight Mode Annunciator (FMA) indicates:
- The status of the A/THR
- The AP/FD vertical and lateral modes
- The approach and landing capability
- The AP/FD and A/THR engagement status
- The autobrake arming status
- The messages of flight guidance, flight controls, or FMS.

The FMA on the HUD provides the same indication and has the same layout as the FMA on the PFD, except for the following indications:
- In the second column, second line, when in managed mode and the altitude target is a constraint, ALT is displayed in reverse video on the HUD whereas ALT is displayed on the PFD
- An armed mode appears in blue on the PFD and is displayed with a dashed line above on the HUD.

DISPLAY MESSAGES

L12	
CHECK ATT	Attitude data on both HUDs differs by more than 5 ° in pitch or roll. Temporarily flashes, then remains steady.
L12	
CHECK CAPT HUD	Appears at the bottom of the F/O HUD. Indicates to the F/O that the CAPT HUD must be checked. Temporarily flashes, then remains steady.
L12	
CHECK F/O HUD	Appears at the bottom of the CAPT HUD. Indicates to the CAPT that the F/O HUD must be checked. Temporarily flashes, then remains steady.
L12	
CHECK HDG	Appears if the difference between the two headings exceeds: - 5 ° in TRUE reference - 7 ° in MAG reference. Temporarily flashes, then remains steady.
COMBINER UNLOCKED	Appears on the center of the HCU. The HCU is deployed and unlocked.
L12	
HUD FAULT	Displayed over the symbology. Temporarily flashes, then remains steady.
HUD NOT ALIGNED	The message shall be displayed on one line centered on the HCU. If not, the HCU and HPU are not aligned.
 HUD NOT AVAIL CDS DUs FAULT	Appears on two lines centered in the HCU. Indicate that the HUD is not available, in accordance with the DUs available.
L12	
REVERT TO PFD	The flight crew must revert to the PFD. Appears when: - EXCESSIVE ATT appears, or - TCAS RA appears. Temporarily flashes, then remains steady.

Ident.: DSC-31-CDS-50-30-140-10-00019805.0003001 / 27 FEB 17

ROW/ROP MESSAGES

L12	RWY TOO SHORT	The ROW function computes that the landing runway is too short. Appears in dark green when the aircraft is between 500 ft RA and 200 ft RA. For more information, *Refer to DSC-34-32-20-20-60 ROW/ROP Messages*. Temporarily flashes, then remains steady.
L12	RWY TOO SHORT	The ROW function computes that the landing runway is too short. Appears in light green when the aircraft is below 200 ft RA. For more information, *Refer to DSC-34-32-20-20-60 ROW/ROP Messages*. Temporarily flashes, then remains steady.
L12	 MAX BRAKING MAX REVERSE	The MAX BRAKING and the MAX REVERSE messages appear simultaneously. For more information, *Refer to DSC-34-32-20-20-60 ROW/ROP Messages*. Temporarily flashes, then remains steady.
L12	 MAX REVERSE	Only the MAX REVERSE message appears. For more information, *Refer to DSC-34-32-20-20-60 ROW/ROP Messages*. Temporarily flashes, then remains steady.
L12	 MAX BRAKING	Only the MAX BRAKING message appears. For more information, *Refer to DSC-34-32-20-20-60 ROW/ROP Messages*. Temporarily flashes, then remains steady.

Ident.: DSC-31-CDS-50-30-140-10-00019807.0002001 / 01 MAR 17

SURV MESSAGES

L12	AVOID TERRAIN	For more information, *Refer to DSC-34-SURV-20-20 TAWS Messages* Temporarily flashes, then remains steady.

L12	
AVOID OBSTACLE	For more information, *Refer to DSC-34-SURV-20-20 TAWS Messages* Temporarily flashes, then remains steady.
L12	
PULL UP	For more information, *Refer to DSC-34-SURV-20-20 TAWS Messages* Temporarily flashes, then remains steady.
L12	
TCAS RA	The TCAS triggers a resolution advisory. Advise the flight crew that a TCAS RA is displayed on the PFD. Temporarily flashes, then remains steady.
L12	
WIND SHEAR	For more information, *Refer to DSC-22-27-20 Reactive Windshear Detection*. Temporarily flashes, then remains steady.
L12	
W/S AHEAD	For more information, *Refer to DSC-34-SURV-30-20 Windshear Messages* Temporarily flashes, then remains steady.

Ident.: DSC-31-CDS-50-30-140-10-00019808.0001001 / 02 OCT 14

FLIGHT ENVELOPE

L12	
BANK BANK	For more information, *Refer to DSC-22-27-20 Bank Angle Protection*. Temporarily flashes, then remains steady.
L12	
EXCESSIVE ATT	Indicates that the attitude of the aircraft is excessive. Temporarily flashes, then remains steady.
STALL STALL	Appears if at least one FWS detects the stall. For more information, *Refer to DSC-22-27-10-20 V alpha sw*.
L12	
USE MAN PITCH TRIM	Appears when the direct law is active. For more information, *Refer to DSC-27-10-40 Direct Law*. Temporarily pulses, then remains steady.

Ident.: DSC-31-CDS-50-30-140-10-00024046.0001001 / 01 JUN 17

AUTO EMER DESCENT MESSAGES

L12	EMER DESCENT ARMED	The AUTO EMER DESCENT function is manually armed. For more information, *Refer to DSC-22-FG-70-60-40 Arming Conditions*. Temporarily flashes, then remains steady.
L12	AUTO EMER DES IN XX S	The AUTO EMER DESCENT function is automatically armed. For more information, *Refer to DSC-22-FG-70-60-40 Arming Conditions*. A 15 s countdown starts after the automatic arming of the AUTO EMER DESCENT function. Temporarily flashes, then remains steady.
L12	AUTO EMER DES ENGAGED	The EMER DES mode is automatically engaged. For more information, *Refer to DSC-22-FG-70-60-40 Engagement Conditions*. Temporarily flashes, then remains steady.
L12	AUTO EMER DES COMPLETED	The AUTO EMER DESCENT is completed. For more information, *Refer to DSC-22-FG-70-60-40 Disengagement Conditions*. The AUTO EMER DES COMPLETED message remains displayed until the flight crew either: - Changes any AFS CP target, or - Selects another AFS mode, or - Voluntarily disconnects the AP. Temporarily flashes, then remains steady.

Intentionally left blank

HUD Reduced Display Modes

HUD MODE INDICATOR

Ident.: DSC-31-CDS-50-30-150-00018248.0001001 / 09 JUL 19
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

Indicates the mode of the HUD:

N	The HUD is in normal mode.
D	The HUD is in declutter 1 mode.

Disappears in declutter 2 mode.
The flight crew can remove some information displayed on the HUD, in order to improve the observation of external parameters.

The flight crew can select different levels of declutter, in accordance with the flight phase:
- In the taxi phase, there is one level of declutter available
- In the approach phase, there are two levels of declutter available: D1 and D2

L2 Declutter 1 mode is available only when the approach phase of the FMS is active.

L1 - In all flight phases except the approach phase, there is one level of declutter available.

For more information about the declutter mode, *Refer to DSC-31-CDS-50-30-150 Declutter Modes*.
When flying in crosswind conditions, the aircraft trajectory and guidance symbols may reach the border of the display zone.
In flight, the flight crew can reduce the size of the speed and altitude scales, via the XWIND sw on the HUD CP, in order to maintain adequate visibility of the symbols.
For more information about the Crosswind mode, *Refer to DSC-31-CDS-50-30-150 Crosswind Mode*.

DECLUTTER MODES

Ident.: DSC-31-CDS-50-30-150-00018249.0003001 / 04 MAY 18
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

TAXI

The flight crew can remove the following symbols, via the DECLUTTER sw on the HUD CP:
- The pitch scale
- The airspeed scale
- The altitude scale
- The barometric setting.

Normal Mode

When the flight crew sets the takeoff thrust, the HUD automatically displays the normal mode for takeoff.

IN FLIGHT

In normal and declutter 1 mode, the flight crew can also select the crosswind mode in order to reduce the size of the speed and altitude scales.
In declutter 2 mode, the altitude and speed scales are already reduced, therefore the X WIND sw has no effect on the display.

During the approach phase, the flight crew can remove the following approach symbols, via the DECLUTTER sw one time on the HUD CP:

- The synthetic runway
- The LOC axis
- The touchdown point, or the anchor point.

The flight crew can choose to display only the following symbols, via the DECLUTTER sw used two times in the approach phase, or used one time in the other flight phases:

- The flight path vector
- The flight director
- The current heading
- The selected heading (track)
- The horizon line
- The aircraft reference, if the tail strike margin is less than 1 °
- A part of the pitch scale
- The reduced airspeed scale
- The reduced altitude scale
- The flare reminder
- The approach tail strike symbol, if the tail strike margin is less than 1 °
- The energy chevrons
- The selected FPA
- The final approach FPA
- The delta speed
- The radio altitude
- The A/THR messages and modes, and the annunciations within boxes on the FMA
- The flags and messages in the case of alerts.

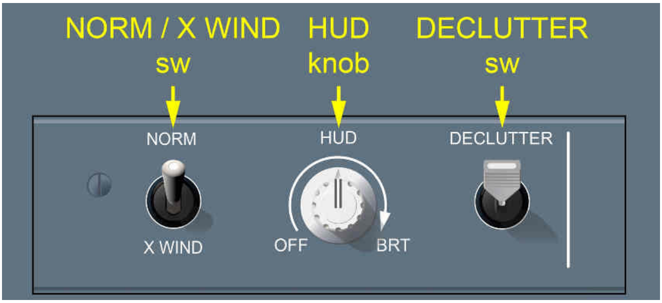
HUD Control Panel

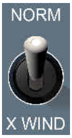


There are two identical HUD Control Panels (HUD CP):
- One HUD CP on the Captain side
- One HUD CP on the First Officer side.

Each HUD CP is associated with the corresponding HUD.

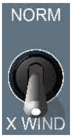
Ident.: DSC-31-CDS-50-40-10-00018254.0001001 / 24 APR 14

NORM / X WIND SW



The flight crew selects the normal mode of the HUD.

L12

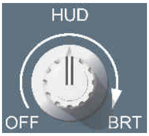


The flight crew selects the crosswind mode of the HUD.
The X WIND sw reduces the size of the speed and altitude scales, only if the aircraft is in flight.

For more information about the crosswind mode, *Refer to DSC-31-CDS-50-30-150 Crosswind Mode*.

Ident.: DSC-31-CDS-50-40-10-00018255.0001001 / 24 APR 14

HUD BRIGHTNESS KNOB

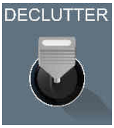


When turned, turns the HUD on or off, and adjusts the brightness.

Ident.: DSC-31-CDS-50-40-10-00018256.0001001 / 24 APR 14

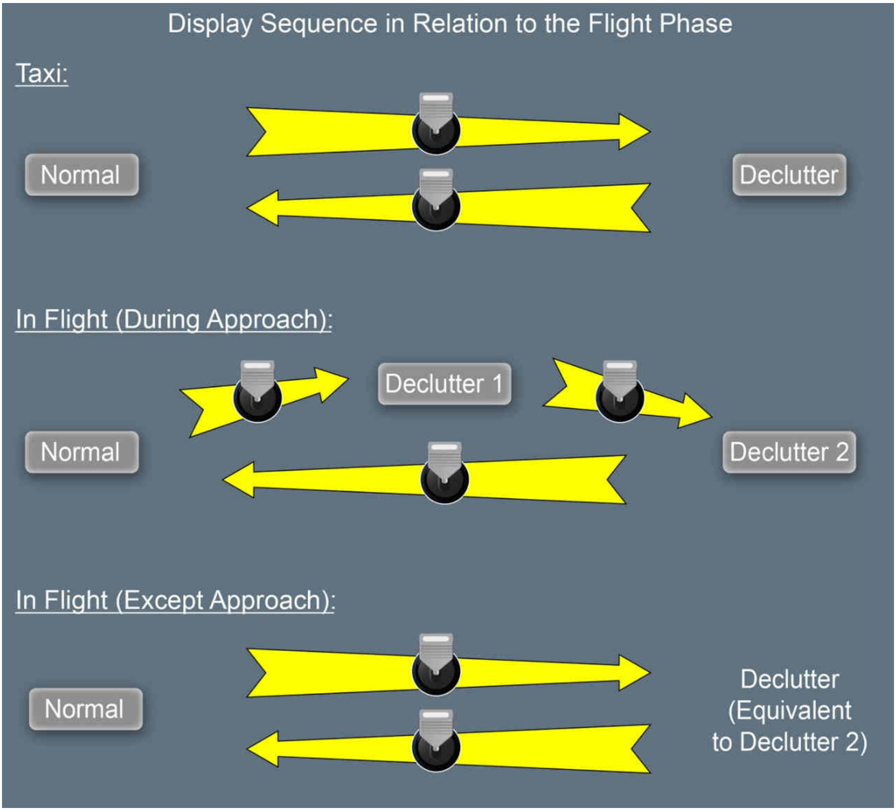
DECLUTTER SW

L12



The flight crew uses the DECLUTTER sw to reduce the HUD display.

The DECLUTTER sw changes the display, when the HUD is in:
- Taxi phase, or
- Flight phase.



Display Sequence in Relation to the Flight Phase
Taxi:
Normal
Declutter
In Flight (During Approach):
Declutter 1
Normal
Declutter 2
In Flight (Except Approach):
Normal
Declutter
(Equivalent
to Declutter 2)

For more information about the declutter modes, *Refer to DSC-31-CDS-50-30-150 Declutter Modes*.

HOW TO MOVE THE HCU

Ident.: DSC-31-CDS-50-70-00022747.0001001 / 30 JAN 17
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

The flight crew should always apply the following:

- All actions on the HCU handle and on the thumbpad should be performed in sequence and not simultaneously
- Move the HCU with only the hand on the side of the HCU handle with the thumbpad
- Do not touch the glass (e.g. to not put fingerprints on the glass).

HOW TO DEPLOY THE HCU

Ident.: DSC-31-CDS-50-70-00022748.0001001 / 03 JUL 20
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

1
2 The HUD is off, and the HCU is locked in the stowed position.
In order to use the HUD, the flight crew should apply the following procedure:

CAUTION	The HCU must be operated with one hand only. The flight crew should use the hand located on the side of the HCU handle. The deployment or stowage of the HCU with two hands may damage the HCU mechanism.

STEP 1

Pull the HCU handle to the maximum with one hand to unlock the HCU. The HCU slightly moves downward to the stop position (intermediate position). Release the HCU handle.

STEP 2

Put the hand on the thumbpad of the HCU and deploy the HCU to the operational position (steady position).
When the HCU is in the operational position, release the thumbpad of the HCU.

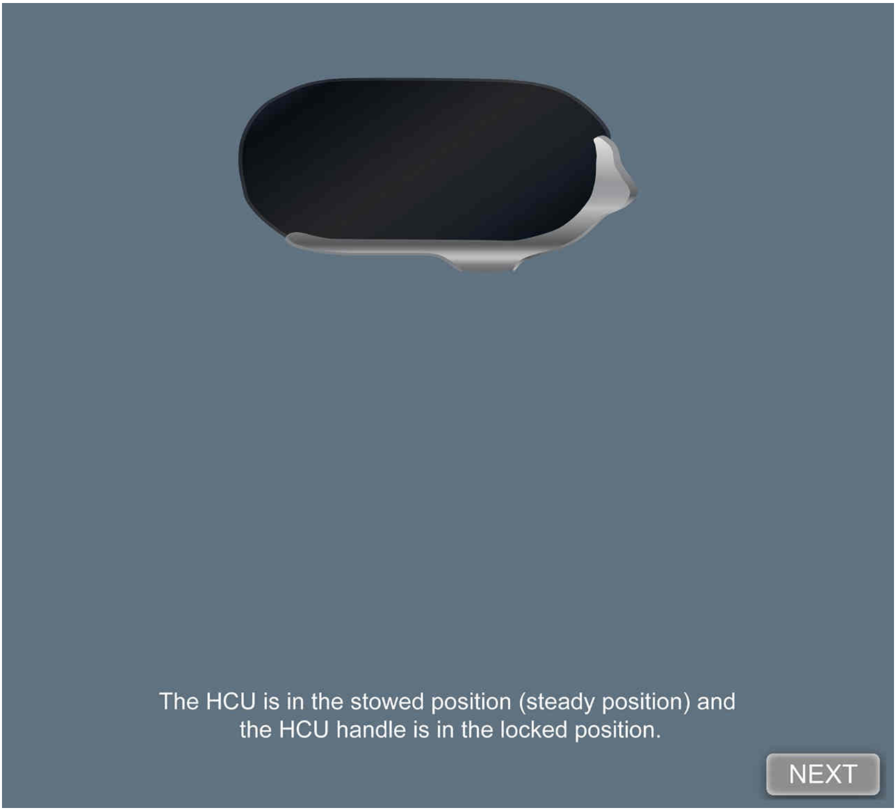
STEP 3

Push the HCU handle with one hand, in order to lock the HCU in the operational position.
When the HCU is locked in the operational position, release the HCU handle.

3 **STEP 4**

Switch on the HUD via the HUD knob on the glareshield.
L2 At HUD power-up, the HPU performs a fast functional test, then the attitude and other flight data appear on the HCU.
L1 Adjust the brightness as necessary via the HUD knob.
The illustration below illustrates the different steps for the deployment of the HCU.

Illustrated Sequence



The HCU is in the stowed position (steady position) and the HCU handle is in the locked position.

HOW TO STOW THE HCU

Ident.: DSC-31-CDS-50-70-00022749.0001001 / 03 JUL 20
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

4 The HUD is on, and the HCU is deployed and locked in the operational position.
The flight crew can stow the HCU during flight (e.g. in the cruise phase), or on ground.

CAUTION	The HCU must be operated with one hand only. The flight crew should use the hand located on the side of the HCU handle. The deployment or stowage of the HCU with two hands may damage the HCU mechanism. Once initiated the following procedure must be fully completed.

STEP 1

Switch off the HUD via the HUD knob on the glareshield.

5 STEP 2

Pull the HCU handle to the maximum with one hand to unlock the HCU. The HCU slightly moves to the pre-operational position (intermediate position).

When the HCU is in the pre-operational position, release the HCU handle.

STEP 3

Move the HCU upward with one hand on the thumbpad, in order to reach the stowed position (steady position).

When the HCU is in the stowed position, release the thumbpad.

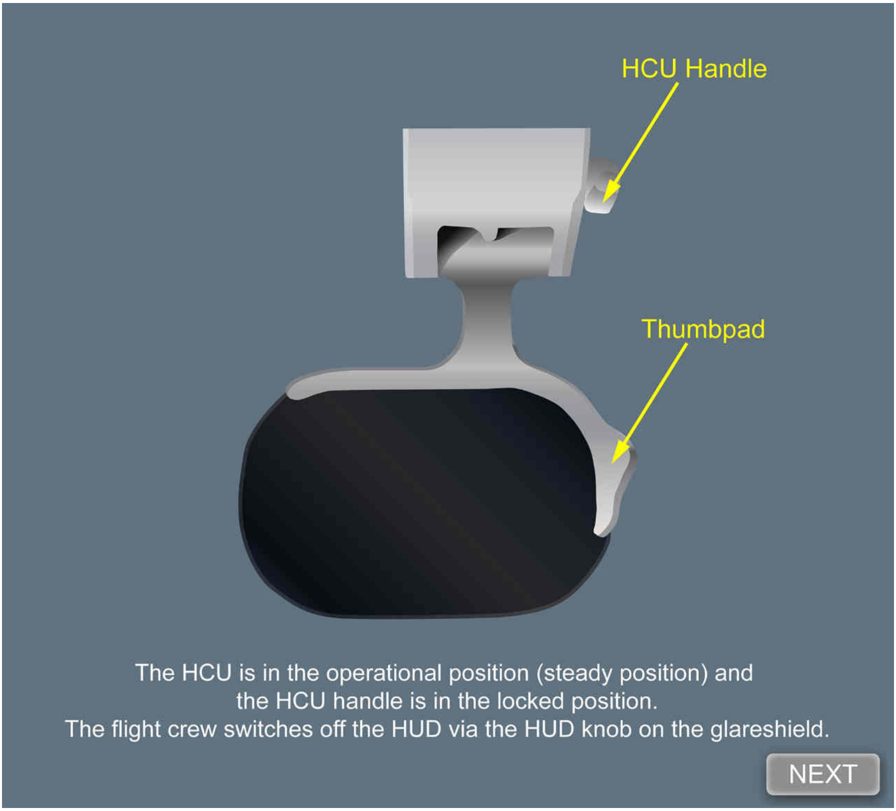
6 STEP 4

Push the HCU handle with one hand to lock the HCU in the stowed position.

When the HCU is locked in the stowed position, release the HCU handle.

The illustration below illustrates the different steps for the stowage of the HCU.

Illustrated Sequence



The HCU is in the operational position (steady position) and the HCU handle is in the locked position.
The flight crew switches off the HUD via the HUD knob on the glareshield.

HOW TO RELEASE THE HCU FROM THE BREAKAWAY ZONE/POSITIONS

Ident.: DSC-31-CDS-50-70-00022750.0001001 / 30 JAN 17
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

In the case of an inadvertent action on the HCU from the operational position, the HCU may reach the breakaway zone or reach one of the following positions:

- The breakaway stop position
- The locked breakaway position.

CAUTION	The HCU must be operated with one hand only. The flight crew should use the hand located on the side of the HCU handle. The deployment or stowage of the HCU with two hands may damage the HCU mechanism.

BREAKAWAY ZONE

If the HCU reaches the breakaway zone, the flight crew cannot see any flight data on the HCU.
In order to use the HUD, the flight crew should apply the "How to Stow the HCU" procedure, then should apply the "How to Deploy the HCU" procedure.

LOCKED BREAKAWAY POSITION

When the HCU reaches the locked breakaway position, the red breakaway release button appears and is engaged. Therefore, the HCU is mechanically blocked.
In order to release the HCU from the locked breakaway position, the flight crew should apply the following procedure:

STEP 1

Move the red breakaway release button to the right with the hand located on the side of the HCU handle, so that the HCU moves to the breakaway stop position. The HCU handle remains in the locked position.

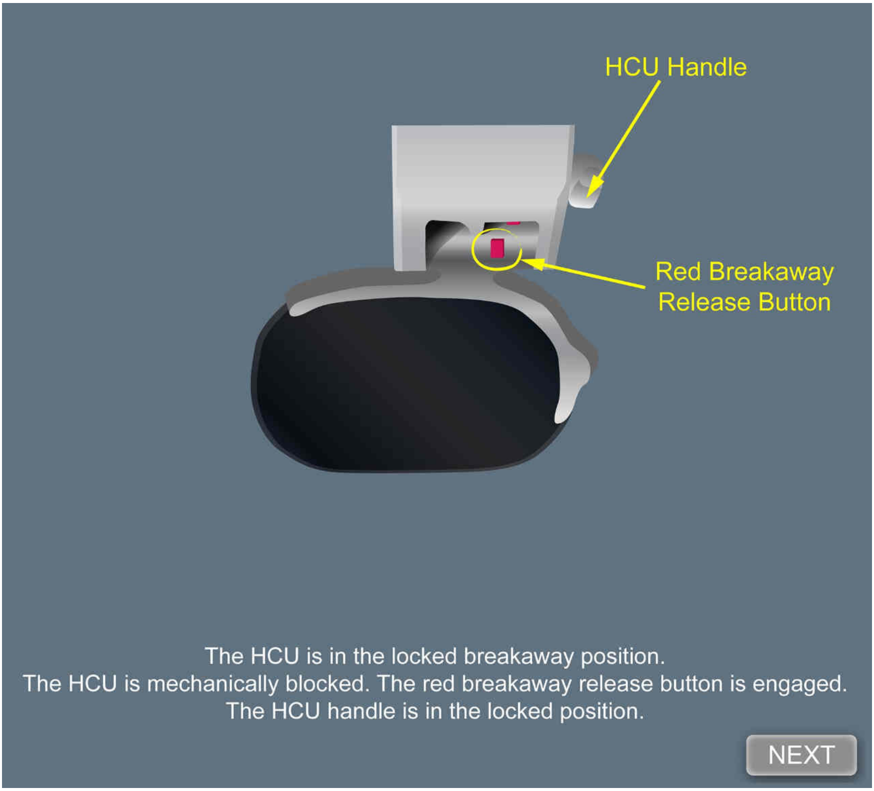
STEP 2

With one hand on the thumbpad, pull the HCU back to the operational position.

STEP 3

Then, apply the "How to Stow the HCU" procedure.
The illustration below illustrates the different steps that the flight crew should apply to release the HCU from the locked breakaway position.

Illustrated Sequence



HCU Handle
Red Breakaway Release Button
NEXT

The HCU is in the locked breakaway position.
The HCU is mechanically blocked. The red breakaway release button is engaged.
The HCU handle is in the locked position.

General

GENERAL

Ident.: DSC-31-CDS-60-10-00-00000002.0001001 / 24 APR 14
Applicable to: ALL

The Electronic Centralized Aircraft Monitoring (ECAM) function assists the flight crew in managing and monitoring the aircraft systems during both normal and abnormal operations.

The ECAM:
- Displays aircraft system information
- Monitors aircraft systems
- Identifies abnormal system operations, and triggers the related alerts and dispatch messages
- Indicates the required flight crew actions in abnormal and emergency situations
- Provides operational information to the flight crew
- Displays the checklists.

Intentionally left blank

Architecture

ARCHITECTURE

Applicable to: ALL

Ident.: DSC-31-CDS-60-10-20-10-00000003.0001001 / 24 APR 14

The ECAM has:

- 2 Flight Warning Systems (FWS)
- 1 ECAM Control Panel (ECP)
- 4 attention-getters

The ECAM information appears on various displays.

Ident.: DSC-31-CDS-60-10-20-10-00000004.0003001 / 06 MAY 14

FWS

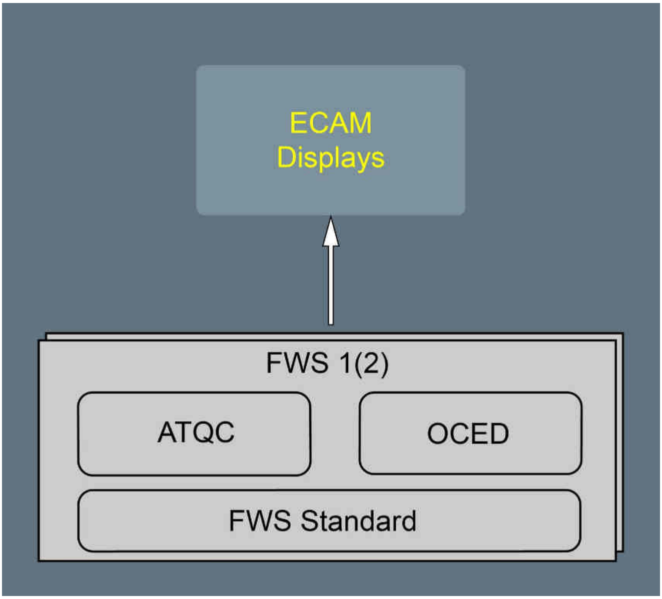
Both FWS receive information from aircraft systems in real time.

L3 Each FWS directly receives system information mainly via the avionics network. Systems that are not able to directly communicate via the avionics network transmit the parameters via the assigned Common Remote Data Concentrators (CRDCs).
In addition to the avionics network, conventional buses also ensure direct communication between each FWS and specific systems, and between FWS and the CDS.

Two CPIOMs host two independent FWS, as follows:
- CPIOM-J11 hosts FWS 1
- CPIOM-J12 hosts FWS 2.

L1 To manage the ECAM functions each FWS has:
- A flight warning software also referred to as FWS standard
- Two types of database to enable FWS standard modification and customization:
  - The Airbus Temporary Quick Change (ATQC) database
  - The Operator-Customized ECAM Database (OCED)

FWS Databases



FWS STANDARD

The FWS standard contains all the ECAM logics, and information to process all the ECAM functions.
For more information about ECAM functions, *Refer to DSC-31-CDS-60-10-10 Overview*.

ATQC DATABASE

The ATQC database enables Airbus to update the FWS standard, in between two standards.
The ATQC is mainly dedicated to modify the ECAM alerts.
L3 The ATQC enables Airbus to modify any part of the FWS standard, except the checklists.

L1 As a consequence, an ECAM alert that is modified, or updated, via the ATQC is temporary. The modification remains applicable until the appropriate technical solution is applied to the aircraft (new FWS standard or new system standard).

L2 The ATQC always has priority over the OCED and the FWS standard.
The FWS check that the ATQC database is compatible with the FWS standard. If the ATQC database is not compatible, the ECAM triggers the FWS ATQC DATABASE dispatch message.

L1 OCED DATABASE

The OCED database enables the operators to customize the checklists and some of the ECAM alerts, if necessary.

L3 The OCED enables Operators to:
- Modify the checklists
- Add not-sensed procedures
- Add more information to abnormal and emergency procedures.

L1 The FWS can have two OCED. The flight crew can change the active OCED via the C/L MENU page of MFD, when the aircraft is on ground.
L3 When the FWS changes the OCED, both FWS reset and the new OCED is loaded in both FWS.
L2 The OCED always has priority over the FWS standard.
The FWS check that the OCED database is compatible with the FWS standard. If the OCED database is not compatible, the ECAM triggers the FWS CPNY DATABASE dispatch message.
For more information about how to change the OCED, *Refer to DSC-31-CDS-60-50 How to Change COMPANY ECAM DATABASE*.

Ident.: DSC-31-CDS-60-10-20-10-00000005.0001001 / 24 APR 14

ECP

The flight crew uses the ECP to:
- Select abnormal not-sensed procedures
- Select deferred procedures
- Interface with the procedures that appear on the WD
  - Sensed abnormal procedures
  - Deferred procedures
  - Abnormal not-sensed procedures.
- Display the SD pages
- Display the dispatch messages.

For more information about ECP, *Refer to DSC-31-CDS-60-20 ECP*.

Ident.: DSC-31-CDS-60-10-20-10-00000076.0001001 / 24 APR 14

KCCU s

The Keyboard and Cursor Control Units (KCCUs) is part of the Control and Display System.
The flight crew uses the KCCU to interface with the checklists that appear on the MFDs.
For more information about KCCU, *Refer to DSC-31-CDS-60-20 KCCU*.

Ident.: DSC-31-CDS-60-10-20-10-00000006.0001001 / 24 APR 14

ATTENTION-GETTERS

Each flight crewmember has two attention-getters on the glareshield:
- 1 MASTER WARN pb
- 1 MASTER CAUT pb.

Each attention-getter has a light that informs the flight crew of an alert:
- The MASTER WARN light of both MASTER WARN pushbuttons flashes in the case of an ECAM alert for an emergency situation
- The MASTER CAUT light of both MASTER CAUT pushbuttons comes on in the case of an ECAM alert for an abnormal situation.

Note: *In the case of simultaneously-triggered alerts, all MASTER WARN lights and MASTER CAUT lights may come on at the same time.*

The flight crew can turn off the lights and stop the associated audio indicator, by pressing the corresponding attention-getter.
For more information, *Refer to DSC-31-CDS-60-20 Attention-Getters*.

Ident.: DSC-31-CDS-60-10-20-10-00000007.0001001 / 24 APR 14

LOUDSPEAKERS AND BOOMSETS

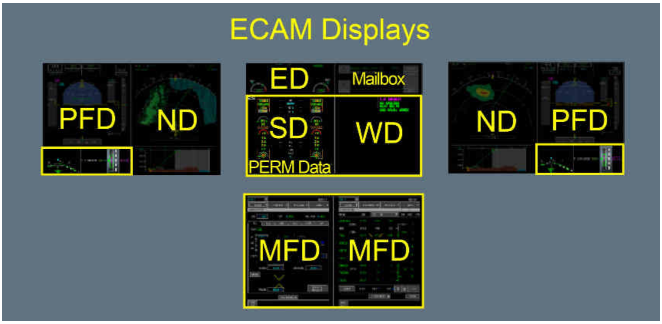
The ECAM can emit audio indicators via the loudspeakers and the boomsets of the cockpit.

Note: *The ECAM manages the priority of all audio indicators.*

For more information about loudspeakers and boomsets, *Refer to DSC-23-10-10 Communication Equipment*.

DISPLAYS

ECAM Displays



The ECAM information appears on the:
- MFD for checklists
- WD for abnormal and emergency procedures, deferred procedures, limitations, and memos
- Lower part of the PFD:
  - For limitations that have an immediate effect on the flight
  - For memos.
- SD for system displays, aircraft status and dispatch messages
- Permanent Data for temperature data, time data, G load data, aircraft weight data, and fuel data.

In addition, the ECAM communicates with the Onboard Information System (OIS) for the display of information in various OIS applications. For more information, *Refer to DSC-46-OIS-10-10 Overview*.

ECAM Function

OVERVIEW

Ident.: DSC-31-CDS-60-10-10-00018772.0001001 / 24 APR 14
Applicable to: ALL

IN NORMAL AIRCRAFT OPERATION

The FWS:

- Displays memos on WD and PFD

L2 For more informations about memos, *Refer to DSC-31-CDS-60-10-40 Limitations and Memos*.

L1 - Displays the checklists on the MFD, on flight crew request

L2 For more information about checklists, *Refer to DSC-31-CDS-60-10-30 General*.

L1 - Displays SD page in accordance with the flight phase, or on flight crew request

L2 For more information about SD pages, *Refer to DSC-31-CDS-60-10-50 SD Pages*.

L1 - Generates audio indicators.

L2 For more information about audio indicators, *Refer to DSC-31-CDS-60-10-10 Audio Indicators*.

L3 The SURV system also generates some of the audio indicators. Nevertheless, the ECAM manages the priority of all audio indicators.

L1 IN ABNORMAL AIRCRAFT OPERATION

If the FWS detects system failures or the abnormal operation of systems or a degraded state of the aircraft, the FWS:

- Triggers the applicable alerts
  The FWS manages alert priority.

L2 For more information about alerts, *Refer to DSC-31-CDS-60-10-10 Definition*.

L1 The FWS can inhibit some alerts during specific flight phases. The FWS computes these flight phases.

L2 For more information about the ECAM flight phases, *Refer to DSC-31-CDS-60-10-10 ECAM Flight Phases*.

L1 - Displays the associated procedures
The procedures include abnormal and emergency procedures and deferred procedures.

L2 For more information about the ECAM procedures, *Refer to DSC-31-CDS-60-10-40 Overview*.

L1 - Displays the applicable System Display (SD) pages with failed systems

L2 For more information about SD pages, *Refer to DSC-31-CDS-60-10-50 SD Pages*.

L1 - Advises the flight crew in case of parameter drift

L2 For more information about the advisory function, *Refer to DSC-31-CDS-60-10-10 Advisory*.

L1 - Provides the aircraft status

L2 For more information about ECAM STATUS, *Refer to DSC-31-CDS-60-10-50 STATUS Page and STATUS MORE Page*.

L1 - Displays the limitations

L2 For more information about limitations, *Refer to DSC-31-CDS-60-10-40 Limitations and Memos*.

L1 - Displays dispatch messages.
Dispatch messages are system failures that can affect the dispatch of the aircraft in accordance with MEL information.

L2 For more information about dispatch messages, *Refer to DSC-31-CDS-60-10-50 DISPATCH Page*.

ALERT TYPES AND LEVELS

Applicable to: ALL

Ident.: DSC-31-CDS-60-10-10-20-00000029.0001001 / 24 APR 14

DEFINITION

An ECAM alert is a visual or aural signal that helps the flight crew to detect and identify:
- A system failure, or
- The abnormal operation of a system, or
- A degraded state of the aircraft.

An ECAM alert can include one or more of the following visual and aural signals:
- MASTER WARN light or MASTER CAUT light
- Specific local light
- ECAM procedure on the WD
- SD page on the SD
- Audio indicator.

Ident.: DSC-31-CDS-60-10-10-20-00000072.0001001 / 24 APR 14

ALERT LEVELS

There are three levels of ECAM alerts:
- Warnings (level 3)
- Cautions (level 2 and level 1).

The ECAM receives information from aircraft systems, computes alerts (warnings and cautions) in real time, then displays and sounds these alerts in the cockpit.

If applicable, an ECAM procedure can be part of an ECAM alert:
- An ECAM procedure associated with a warning is referred to as an ECAM emergency procedure
- An ECAM procedure associated with a caution is referred to as an ECAM abnormal procedure.

For more information about ECAM procedures, *Refer to DSC-31-CDS-60-10-40 Overview*.

The ECAM alerts are categorized in the three levels, based on the situation and the priority of required actions:

Alert Level	Color	Description	Audio Indicators	Visual Signals
Warning (Level 3)	Red	For an emergency situation that requires immediate flight crew action, because: - The aircraft is in a dangerous configuration, or in a limiting flight condition - A failure of a system affects the safety of the flight.	Continuous Repetitive Chime (CRC), or a specific sound, or a synthetic voice message, or a specific sound with a synthetic voice message	- Flashing MASTER WARN light, with or without a specific local red light. - Title of the alert displayed on the WD, with the associated emergency procedure, if any. - Applicable SD page automatically displayed on the SD, if any.
Caution (Level 2)	Amber	For an abnormal situation that the flight crew should be aware of, but that does not require immediate action, because the failure does not immediately affect the flight. However, when time and situations permit, the flight crew should consider these cautions without delay, to prevent any additional degradation of the affected system, or of any other associated system.	Single Chime (SC)	- Steady MASTER CAUT light, with or without a specific local amber light. - Title of the alert displayed on the WD, with the associated abnormal procedure, if any. - Applicable SD page automatically displayed on the SD, if any.
Caution (Level 1)	Amber	For a situation that requires the flight crew to be informed (crew awareness), and may require flight crew action (e.g. redundancy loss, or system degradation).	None	- Title of the alert displayed on the WD, usually with no associated abnormal procedure. - Applicable SD page automatically displayed on the SD, if any.

Ident.: DSC-31-CDS-60-10-10-20-00000028.0001001 / 24 APR 14

PRIORITY OF ALERTS

There are three levels of priority associated with warnings and cautions:
- Warnings (level 3)
- Cautions (level 2)
- Cautions (level 1).

Level 3 warnings have priority over level 2 cautions, that have priority over level 1 cautions.
In addition, if the ECAM detects several alerts that have the same level, the ECAM displays these alerts in their decreasing order of priority. In all cases, the ECAM first displays the alert that has the highest priority, and that the flight crew should take into account first.

Ident.: DSC-31-CDS-60-10-10-20-00000009.0001001 / 24 APR 14

ALERT TYPES

The ECAM alerts are categorized in three types, depending on their possible effect on other systems:

Alert Type	WD Display (Alert Title)	Description
Independent	 F/CTL PRIM 1 FAULT	For a failure that affects a system, but does not degrade the performance of other aircraft systems.
Primary	 HYD G SYS PRESS LO	For a failure that affects a system, and causes the loss or the degradation of other systems.
Secondary	 *F/CTL	For the loss of a system, a system reconfiguration, or a system limitation, that is the result of a primary failure. Affected parts of the affected system are indicated on the corresponding SD page.

GENERAL

Ident.: DSC-31-CDS-60-10-10-00000039.0001001 / 10 APR 18
Applicable to: ALL

An advisory indicates that a monitored parameter of an aircraft system starts to deviate from the usual operational range, but does not reach a level that triggers an alert.
An advisory is indicated by the affected parameter that pulses in green on the applicable SD page.
The parameter pulses in green as long as the parameter is out of the usual operational range.

The following SD pages can display advisories:
- APU SD page
- CAB PRESS SD page
- CRUISE page
- ENG SD page
- F/CTL SD page

When there is an advisory, the SD and the WD display the applicable information, as follows:
- If the current SD page is a page that the SD automatically displays based on the current flight phase:
  The current SD page automatically changes to the SD page of the system affected by the advisory.
  The ECP pushbutton that is associated with the affected SD page comes on.
- If the current SD page is a page that the flight crew manually selected:
  The current SD page remains displayed.
  The ECP pushbutton that is associated with the affected SD page flashes. It flashes, until the flight crew presses it to manually display the SD page of the system affected by the advisory.

- If the current SD page is a page that is associated with an ECAM alert:
  The current SD page remains displayed.
  The SD page of the system affected by the advisory does not appear, until the flight crew clears the alert.
- If the WD displays memos or limitations, the ADV reminder appears on the last line of the WD.
  For more information on the reminder, *Refer to DSC-31-CDS-60-10-40 ADV Reminder*.

L3 In the case of several advisories on different SD pages, only the advisory that has the higher level is taken into account.

L1 When there is an advisory, the flight crew should check the applicable SD page to monitor the affected parameter. For more information, *Refer to ECAM Advisory*.

AUDIO INDICATORS

Ident.: DSC-31-CDS-60-10-10-00000066.0005001 / 03 JAN 19
Applicable to: ALL

The aircraft can generate three types of audio indicators:
- Sounds
- Synthetic voice messages
- Sounds associated with synthetic voice messages.

L3 Two aircraft systems can provide audio indicators:
- The ECAM
- The SURV system.

The ECAM always manages the priority of all audio indicators.
Any generated audio indicator will be entirely played, even if the triggering condition is no longer applicable.

L1

Audio Indicator	Meaning
Auto Brake Off (Synthetic Voice)	The flight crew disconnected the autobrake after touchdown. For more information, *Refer to AUTO BRK OFF audio indicator*
Auto Brake Off, Auto Brake Off (Synthetic Voice)	The autobrake is disconnected after touchdown due to a failure. For more information, *Refer to AUTO BRK OFF audio indicator*
Avoid Obstacle (Synthetic voice)	TAWS alert. For more information, *Refer to (Surveillance -TAWS)*.
Avoid Terrain (Synthetic voice)	TAWS alert. For more information, *Refer to (Surveillance -TAWS)*.

Audio Indicator	Meaning
Terrain (Synthetic voice)	TAWS alert. For more information,*Refer to (Surveillance - TAWS)*.
Terrain, Terrain (Synthetic voice)	TAWS alert. For more information, *Refer to (Surveillance -TAWS)*.
Terrain Ahead, Terrain Ahead (Synthetic voice)	TAWS alert. For more information, *Refer to (Surveillance - TAWS)*.
Terrain Ahead, Pull Up (Synthetic voice)	TAWS alert. For more information, *Refer to (Surveillance -TAWS)*.
Time Marker (Sound and Synthetic Voice)	FMS time marker For more information, *Refer to (Flight Management System)*.
Too low, flaps (Synthetic Voice)	TAWS alert. For more information, *Refer to (Surveillance -TAWS)*.
Too low gear (Synthetic voice)	TAWS alert. For more information, *Refer to (Surveillance-TAWS)*.
Too Low, Terrain (Synthetic voice)	TAWS alert. For more information, *Refer to (Surveillance-TAWS)*.
Traffic, Traffic (Synthetic voice)	TCAS advisory For more information, *Refer to (Surveillance - TCAS)*..
Triple Click (Sound)	Reversion of flight guidance mode. For more information, *Refer to (Flight Guidance)*.
Twenty retard (Synthetic voice)	Reminder to retard the thrust levers if manual landing is performed. For more information, *Refer to (Navigation-Radio Altimeter)*..
V1 (Synthetic Voice)	V1 Auto Callout. For more information, *Refer to (Flight Envelope)*.
Weather Ahead (Synthetic Voice)	Weather radar detection For more information, *Refer to (Surveillance - WXR)*.
Windshear (Synthetic Voice)	Reactive Windshear. For more information, *Refer to (Flight Envelope)*.
Windshear Ahead (Synthetic Voice)	Predictive Windshear For more information, *Refer to (Surveillance - WXR)*.

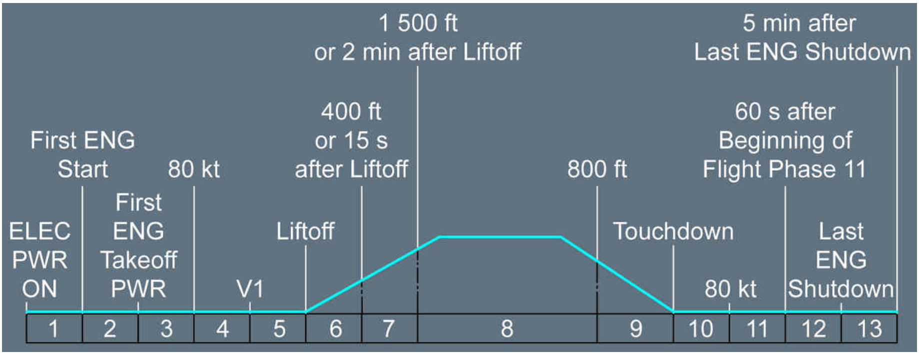
ECAM FLIGHT PHASES

Ident.: DSC-31-CDS-60-10-10-00000011.0001001 / 02 OCT 14
Applicable to: ALL

The ECAM computes ECAM flight phases for the flight.

L2 Each flight is divided into 13 flight phases. Flight phases change according to the aircraft configuration and system input.

ECAM Flight Phases



1 500 ft
or 2 min after Liftoff
5 min after
Last ENG Shutdown
First ENG
Start
80 kt
400 ft
or 15 s
after Liftoff
800 ft
60 s after
Beginning of
Flight Phase 11
ELEC
PWR
ON
First
ENG
Takeoff
PWR
V1
Liftoff
Touchdown
80 kt
Last
ENG
Shutdown
1
2
3
4
5
6
7
8
9
10
11
12
13

L3 *Note: For flight phase computation:*
- *Speed is based on computed airspeed from ADRs*
- *Height is based on radio height from radio altimeters.*

L1 The ECAM uses flight phases to better operate during each flight:
- The ECAM displays dispatch messages when in appropriate flight phases
- During high workload phases, e.g. takeoff and landing, the ECAM inhibits alerts that can be delayed to a more appropriate time
  For more information, See Flight Phase Inhibition.
- The ECAM displays the SD page that corresponds to the current flight phase, unless there is an aircraft system failure
- The ECAM displays the applicable takeoff and landing memos.

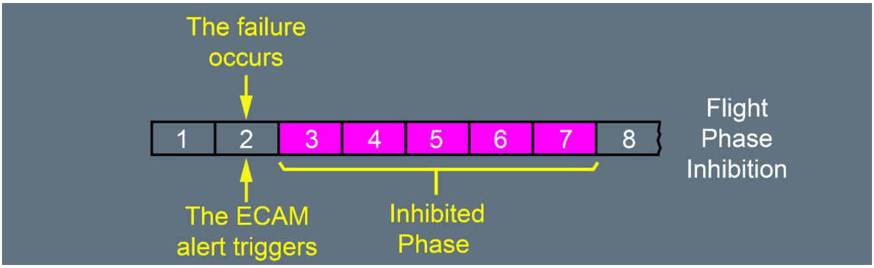
L2 *Note:*
1. *The ECAM flight phases are different and independent of the flight phases that the FMS computes and uses.*
2. *The ECAM flight phases are also different and independent of the flight phases of the CHECKLIST MENU page of the MFD.*
3. *In flight phase 7, if the thrust is reduced (thrust levers at CL) and the aircraft is below 800 ft, the flight phase changes from 7 to 9. When the aircraft reaches 800 ft, the flight phase changes from 9 to 8.*

L1 INHIBITION OF ECAM ALERTS AND MEMOS

When the ECAM detects a system failure, or a system state associated to a memo, the applicable alert or memo is either immediately triggered, or delayed to a more appropriate time.
Therefore, for each ECAM alert and memo, inhibitions are defined in accordance with the ECAM flight phases.

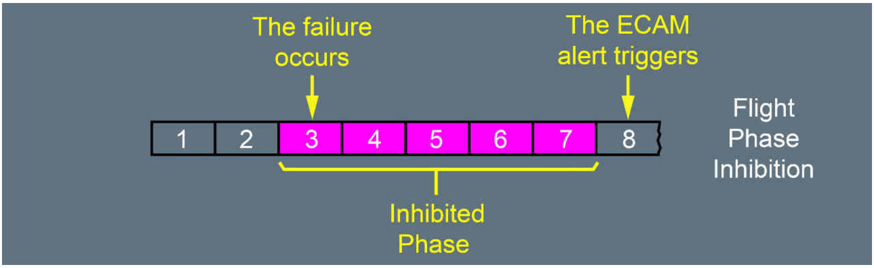
L2 *Note:* 1. *The Flight Crew Operating Manual (FCOM) indicates the flight phase inhibition associated with each alert with the description of the alerts.*
For more information about inhibition of alerts, Refer to PRO-ABN-ABN-00 Annunciations.
2. *Most of memos are not inhibited. Nevertheless, when a memo is inhibited the FCOM indicates the flight phase inhibition associated to each memo with the memo description.*

SCENARIO EXAMPLES



The failure occurs
1
2
3
4
5
6
7
8
Flight Phase Inhibition
The ECAM alert triggers
Inhibited Phase

The failure occurs during the ECAM flight phase 2: The ECAM immediately triggers the alert, and continues to display the associated procedure on the WD, as long as there is the failure (even if the next ECAM flight phase is inhibited).



The failure occurs
The ECAM alert triggers
1
2
3
4
5
6
7
8
Flight Phase Inhibition
Inhibited Phase

The failure occurs during the ECAM flight phase 3: The ECAM inhibits the alert. The alert is triggered and the associated procedure appears on the WD, only when the aircraft exits the ECAM flight phase 7.

L1 INHIBITION OF DISPATCH MESSAGES

DISPATCH MESSAGES ASSOCIATED TO AN ECAM ALERT

If the dispatch message is associated with an ECAM alert then this dispatch message has the same flight phase inhibition than the associated alert.

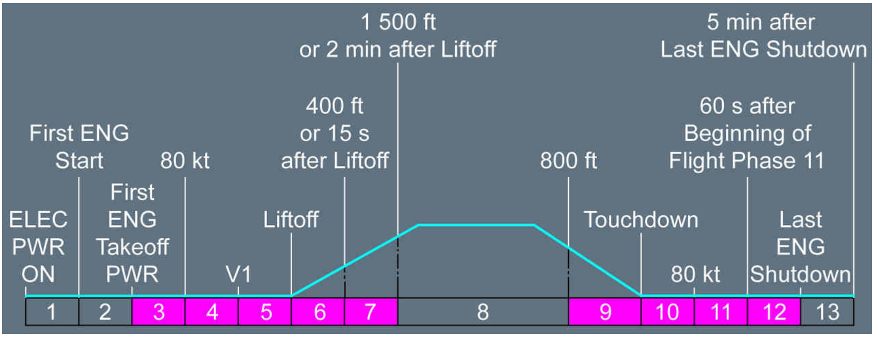
DISPATCH MESSAGES NOT ASSOCIATED TO AN ECAM ALERT

When the ECAM detects a system failure that has a dispatch condition and this dispatch message is not associated with an ECAM alert, the ECAM triggers an independent dispatch message.

Independent dispatch messages are displayed as follows:
- On ground, when the failure assessment is applicable
- In flight, during cruise when the workload is lower, for crew awareness.
L2 Dispatch messages are displayed in cruise for the flight crew to anticipate the consequences of the failure assessment after landing, if needed.

The inhibition of independent dispatch messages is the following:

Flight Phase Inhibition

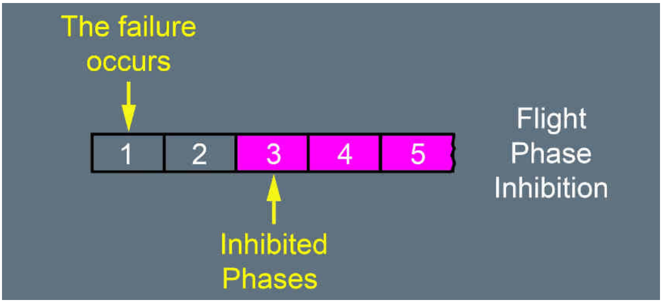


1 500 ft
or 2 min after Liftoff
5 min after
Last ENG Shutdown
400 ft
or 15 s
after Liftoff
60 s after
Beginning of
Flight Phase 11
First ENG
Start
80 kt
800 ft
First
ENG
Takeoff
PWR
ELEC
PWR
ON
Liftoff
V1
Touchdown
80 kt
Last
ENG
Shutdown
1
2
3
4
5
6
7
8
9
10
11
12
13

However, some dispatch messages can also be inhibited in flight phase 2, in particular when there is no:
- Dispatch consequence
- Operational limitation
- Particular operational procedure due to the failure.

SCENARIO EXAMPLE

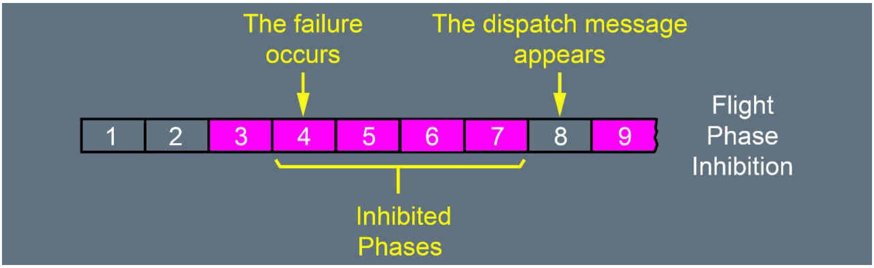
Dispatch Message In Flight Phase 1



The failure occurs
1
2
3
4
5
Flight Phase Inhibition
Inhibited Phases

A system failure associated to an independent dispatch message occurs during phase 1: The ECAM displays the dispatch message on the DISPATCH page. Then, the dispatch message is available as long as the failure remains.

Dispatch Message in Flight Phase 4



The failure occurs
The dispatch message appears
1
2
3
4
5
6
7
8
9
Flight Phase Inhibition
Inhibited Phases

A system failure associated to an independent dispatch message occurs during phase 4: The ECAM inhibits the dispatch message until the aircraft reaches the phase 8. Then, the dispatch message is available as long as the failure remains.

ECAM COLOR CODE

Ident.: DSC-31-CDS-60-10-10-00000013.0001001 / 24 APR 14
Applicable to: ALL

The ECAM displays information in 7 different colors.
Each color has an assigned definition.

RED	- For configurations or failures that require immediate action - For specific memos (e.g. AP OFF), or specific messages (e.g. LAND ASAP).

AMBER	- For configurations or failures that the flight crew should be aware of, but that do not require immediate action However, when time and situations permit, these cautions should be considered without delay, to prevent any additional degradation of the affected system, or of any other related system. - For specific memos (e.g. A/THR OFF), or specific messages (e.g. LAND ANSA).
GREEN	- For information in a procedure, or on the STATUS page - For checklist items that are completed - For memos.
WHITE	- For procedure items that are completed - For submenus, condition lines, titles, and reminders - For information on the STATUS page, or on the STATUS MORE page - For dispatch messages on the DISPATCH page.
BLUE	- For actions to be performed - For limitations - For checklist items to be checked - For titles of checklists that are not completed.
MAGENTA	For specific memos (e.g. T.O INHIBIT).
GRAY	- For checklists that are completed - For items (e.g. procedure lines) that are not yet activated.

MFD

GENERAL

Ident.: DSC-31-CDS-60-10-30-00000014.0001001 / 24 APR 14
Applicable to: ALL

A checklist (C/L) is a reminder of normal operation items, and should be performed in a specific flight phase in accordance with the Standard Operating Procedures (SOPs).
At any time during the flight, the flight crew can access and display a checklist on the MFD.

MFD OVERVIEW

Applicable to: ALL

Ident.: DSC-31-CDS-60-10-30-10-00009747.0002001 / 24 APR 14

The ECAM dedicated pages on the MFD are the C/L pages.
The MFD is interactive. Therefore, the flight crew can navigate through the C/L pages, and perform the checklists, via the KCCU.
For all information about the MFD, *Refer to DSC-31-CDS-70-10 MFD*.

Indicates the title of the checklist.

Ident.: DSC-31-CDS-60-10-30-30-00005798.0001001 / 24 APR 14

BLUE SELECTION BOX

A blue selection box appears around the applicable item line of the checklist. When the flight crew validates or completes the item line, the blue selection box automatically moves to the next applicable item line.
However, the flight crew can manually move the blue selection box, via the KCCU, in order to select any item line of the checklist.

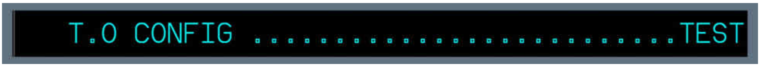
Ident.: DSC-31-CDS-60-10-30-30-00005799.0001001 / 24 APR 14

SENSED ITEM LINE

The checklists have item lines for which the ECAM can detect that the corresponding actions are completed.

These sensed item lines appear as follows:
- When the action is not completed, the item line is in blue

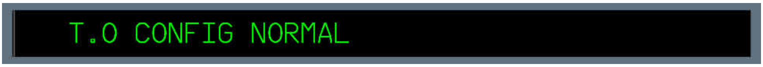
Sensed Item Line - Not Completed - Example



T.O CONFIG ....TEST

- When the action is completed, the item line is in green.

Sensed Item Line - Completed - Example



T.O CONFIG NORMAL

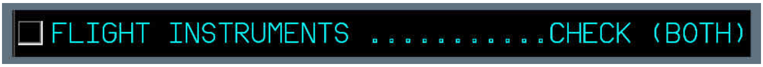
Ident.: DSC-31-CDS-60-10-30-30-00005800.0001001 / 24 APR 14

NOT-SENSED ITEM LINE

The checklists have item lines for which the ECAM cannot detect that the corresponding actions are completed.

A square appears before these not-sensed item lines, as follows:
- When the action is not completed, the item line is in blue

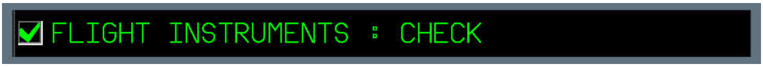
Not-Sensed Item Line - Not Completed - Example



☐ FLIGHT INSTRUMENTS ....CHECK (BOTH)

- When the action is completed and the flight crew validates the item line, the item line appears in green.

Not-Sensed Item Line - Completed - Example



☑ FLIGHT INSTRUMENTS : CHECK

Ident.: DSC-31-CDS-60-10-30-30-00005801.0001001 / 05 NOV 18

C/L COMPLETE BUTTON

When the checklist is completed, the flight crew clicks on the C/L COMPLETE button.

All of the following occurs:
- The item lines of the checklist become gray
- The CHECKLIST page disappears
- The MFD returns to the page that was previously displayed.

Note: *The flight crew can click on the C/L COMPLETE button, and consider the checklist is complete, even if the flight crew did not validate some checklist items. This may be the case after a system failure that prevents the flight crew from completing some checklist items. In that case, the state of all not-sensed lines is memorized and the checklist appears in gray in the checklist menu.*

Ident.: DSC-31-CDS-60-10-30-30-00005802.0001001 / 24 APR 14

RESET BUTTON

When clicked, resets the checklist, as follows:
- All not-sensed item lines are no longer validated
- Sensed item lines for which actions are completed remain validated
- The blue selection box returns to the first line of the checklist.

Note: *When a checklist is reset via the RESET button, all subsequent checklists are reset.*

L2 A checklist can also reset automatically. For more information about automatic checklist reset, *Refer to DSC-31-CDS-60-30 Checklist Automatic Reset*.

Ident.: DSC-31-CDS-60-10-30-30-00005803.0001001 / 24 APR 14

C/L MENU BUTTON

When clicked, displays the CHECKLIST MENU page (*Refer to DSC-31-CDS-60-10-30 CHECKLIST MENU Page*).

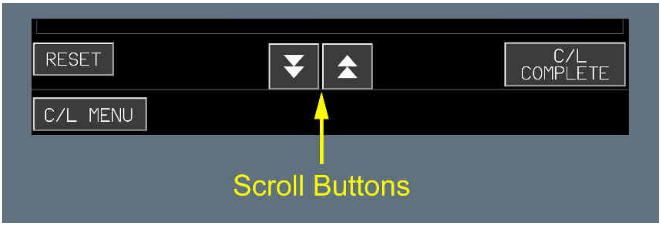
Note: *When the flight crew exits from a checklist via the CHECKLIST MENU button, the state of each not-sensed item line is memorized.*

Ident.: DSC-31-CDS-60-10-30-30-00005804.0001001 / 24 APR 14

SCROLL BUTTONS

The scroll buttons only appear, when the MFD cannot display all item lines of the checklist on a single page.

Scroll Buttons



In the case of a checklist with several pages, the ECAM automatically displays the next checklist page, when the flight crew completes the last item line of the current checklist page.
The flight crew can also use the wheel of the cursor and control device, or the scroll buttons of the checklist page to display the next page or the previous page of the current checklist.

Messages

PURPOSE

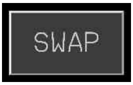
The operator has the capability to load two databases on the aircraft in order to customize the ECAM content.
The COMPANY ECAM DATABASE MANAGEMENT page displays the reference of the active customized ECAM database, and enables the flight crew to change the ECAM customized database from one to the other.

L2 The ECAM customized database is also referred to as the Operator-Customized ECAM Database (OCED). For more information about the OCED, *Refer to DSC-31-CDS-60-10-20 FWS*.

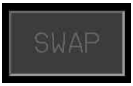
L1 ACCESS

The flight crew can access the COMPANY ECAM DATABASE MANAGEMENT page via the C/L MENU page of the MFD.
For more information about how to change the company ECAM database, *Refer to DSC-31-CDS-60-50 How to Change COMPANY ECAM DATABASE*.

SWAP

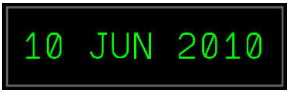


A second database is available.
When pressed, the FWS changes the database to the second database.



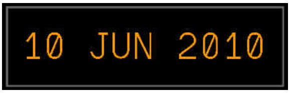
The customized database cannot be changed.
- The aircraft is in flight, or
- There is only one, or no customized database available, or
- The customized database is failed in one FWS.

ACTIVE DATABASE



Displays the current active revision of the company ECAM database.

L12



The exchange of the customized ECAM database is failed.
One or both FWS rejected the new database.
Can be associated with the FWS CPNY DATABASE dispatch message.

SECOND DATABASE

Displays the reference of the second database revision that is not active.

MESSAGES

SWAP IN PROGRESS...

The exchange of customized ECAM database is in progress, both FWS will reset.

L12

SWAP NOT AVAIL	The exchange of the active customized ECAM database is failed. The customized ECAM database is not changed. If the flight crew exits the page and comes back, the message is no longer displayed. The flight crew can try to exchange the databases one more time.

WD

OVERVIEW

Ident.: DSC-31-CDS-60-10-40-00000017.0001001 / 24 APR 14
Applicable to: ALL

The WD displays:
- The active ECAM procedures:
  - The sensed procedures: *Refer to DSC-31-CDS-60-10-40 Sensed Procedures*
  - The abnormal not-sensed procedures: *Refer to DSC-31-CDS-60-10-40 Abnormal Not-Sensed Procedures*
  - The deferred procedures: *Refer to DSC-31-CDS-60-10-40 Deferred Procedures*
- The ABNORMAL NOT-SENSED PROCEDURES page to access abnormal not-sensed procedures.
- The DEFERRED PROCEDURES LIST page to access the deferred procedures: *Refer to DSC-31-CDS-60-10-40 Deferred Procedures*
- Limitations: *Refer to DSC-31-CDS-60-10-40 Limitations*
- Memos: *Refer to DSC-31-CDS-60-10-40 Memos*
- Reminders: *Refer to DSC-31-CDS-60-10-40 Reminders*.

L2 By default, when there is no alert, the WD displays the Limitations and Memos page.

L1 The flight crew uses the ECP to interface with the WD.

The list of ABNORMAL NOT-SENSED PROCEDURES has two parts:

- The first part provides direct access to the not-sensed emergency procedures. The titles of the not-sensed emergency procedures are in red.
- The second part provides access to the not-sensed abnormal procedures in accordance with the ECAM category. The ECAM categories are white, and the not-sensed abnormal procedures are amber.

BLUE SELECTION BOX

A blue selection box automatically appears around the first procedure of the menu.
The flight crew can manually move the blue selection box, via the wheel of the ECP, in order to select any procedure title and to activate it.

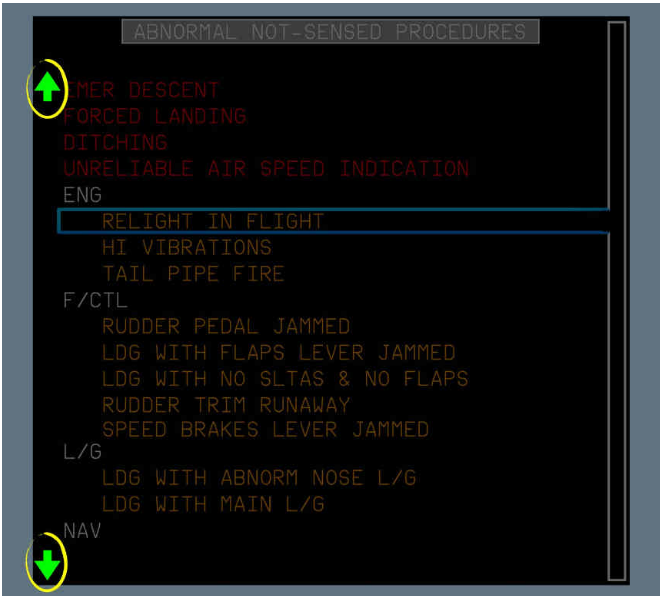
CLEAR BAR

A clear bar, on the right side of the WD, indicates the lines that can be cleared.
If the flight crew presses the CLEAR pb on the ECP, the WD clears the ABNORMAL NOT-SENSED PROCEDURES page, and displays limitations and memos (if any).

OVERFLOW INDICATORS

The WD cannot display the menu of the abnormal not-sensed procedures on a single page. Therefore, overflow indicators appears on the left part of the screen to indicate that more abnormal not-sensed procedures are available above or below the current display.

Overflow Indicators



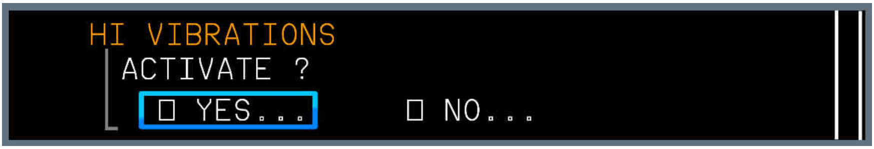
ABNORMAL NOT-SENSED PROCEDURES
EMER DESCENT
FORCED LANDING
DITCHING
UNRELIABLE AIR SPEED INDICATION
ENG
RELIGHT IN FLIGHT
HI VIBRATIONS
TAIL PIPE FIRE
F/CTL
RUDDER PEDAL JAMMED
LDG WITH FLAPS LEVER JAMMED
LDG WITH NO SLTAS & NO FLAPS
RUDDER TRIM RUNAWAY
SPEED BRAKES LEVER JAMMED
L/G
LDG WITH ABNORM NOSE L/G
LDG WITH MAIN L/G
NAV

A green down-arrow (⬇) appears at the bottom left of the screen to indicate that the menu of the abnormal not-sensed procedures continues below the current display.
When the flight crew scrolls down the menu of the abnormal not-sensed procedures, a green up-arrow (⬆) appears at the top left of the screen, to indicate that the menu of the abnormal not-sensed procedures starts above the current display.
When the flight crew scrolls the menu, the ABNORMAL NOT-SENSED PROCEDURES title always remains on top of the WD.

ACTIVATION LINE

When the flight crew selects an abnormal not-sensed procedure in the menu, an activation line appears below the title of the abnormal not-sensed procedure.

Activation Line



HI VIBRATIONS
ACTIVATE ?
☐ YES...
☐ NO...

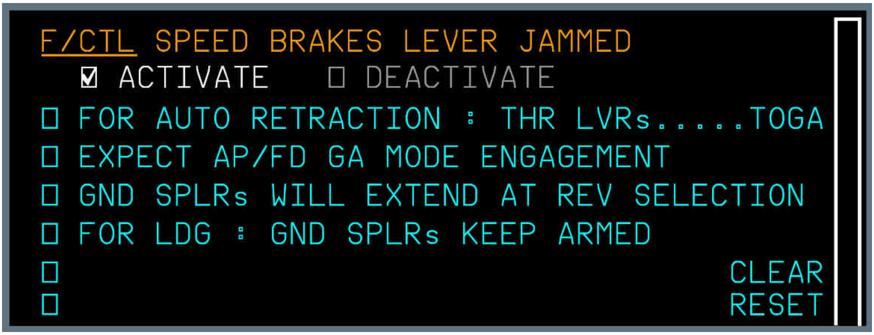
To apply an abnormal not-sensed procedure, the flight crew must activate the procedure by selecting YES... in the activation line.
If the flight crew selects the NO... answer in the activation line, the activation line closes and the blue selection box reverts to the title of the associated abnormal not-sensed procedure.
If the flight crew selects an abnormal not-sensed procedure that is active, the WD directly displays the content of the procedure.

When the flight crew activates an abnormal not-sensed procedure:
- The procedure becomes active, and the WD displays the procedure as any other active procedure
- The SD automatically displays the applicable SD page, if any
- If limitations and memos are associated with the abnormal not-sensed procedure, they become applicable
- If deferred procedures are associated with the abnormal not-sensed procedure, the deferred procedures become available in the DEFERRED PROCEDURES LIST page.
- L2 No audio indicator sounds and no attention-getter comes on.
- L3 No message is sent to the ground.

L1 *Note: To read an abnormal not-sensed procedure with no intention to apply it, the flight crew must display the procedure on the OIS, via the OPS LIBRARY BROWSER.*

The following example shows the display on the WD of an abnormal not-sensed procedure that the flight crew activated via the ABNORMAL NOT-SENSED PROCEDURES menu.

Example of Active Not-Sensed Procedure



```
F/CTL SPEED BRAKES LEVER JAMMED
  ☑ ACTIVATE    ☐ DEACTIVATE
☐ FOR AUTO RETRACTION : THR LVRs.....TOGA
☐ EXPECT AP/FD GA MODE ENGAGEMENT
☐ GND SPLRs WILL EXTEND AT REV SELECTION
☐ FOR LDG : GND SPLRs KEEP ARMED
☐                                   CLEAR
☐                                   RESET
```

To deactivate an abnormal not-sensed procedure, the flight crew can display again the procedure on the WD (via the RCL ALL pb on the ECP, or via the menu of the ABNORMAL NOT-SENSED PROCEDURES), then:

- Select the activation line to DEACTIVATE (on top of the applicable procedure), or
  L2 For more information, *Refer to DSC-31-CDS-60-10-40 Activation Line*.
- L1 Validate the DEACTIVATE action line (at the end of applicable procedures), if any.
  L2 For more information, *Refer to DSC-31-CDS-60-10-40 DEACTIVATE Action Line*.

For more information about the display of active abnormal not-sensed procedure on the WD, *Refer to DSC-31-CDS-60-10-40 Active ECAM Procedure*.

Note: *An automatic deactivation of the abnormal not-sensed procedures can occur in specific conditions. For more information, Refer to DSC-31-CDS-60-30 Automatic Deactivation of Not-Sensed ABN Procedures.*

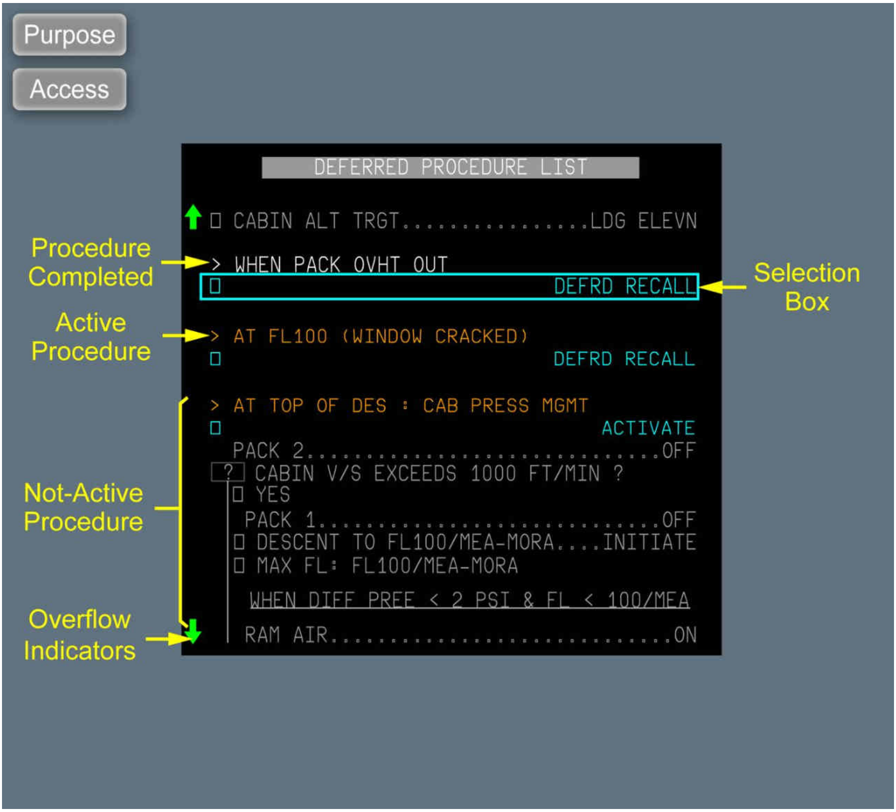
DEFERRED PROCEDURES

Ident.: DSC-31-CDS-60-10-40-00009627.0001001 / 06 MAR 15
Applicable to: ALL

In some cases, an emergency or abnormal procedure has complementary actions that the ECAM delays to a more appropriate time, later during the flight. These complementary actions are referred to as deferred procedures.
When an active emergency or abnormal procedure has a deferred procedure, the deferred procedure is available on the DEFERRED PROCEDURE LIST page.
The flight crew manually displays and activates the deferred procedures, via the DEFERRED PROCEDURE LIST page.

DEFERRED PROCEDURE LIST PAGE

DEFERRED PROCEDURE LIST Page



Purpose
Access
Procedure Completed
Active Procedure
Not-Active Procedure
Overflow Indicators
Selection Box

```
DEFERRED PROCEDURE LIST

☐ CABIN ALT TRGT...............LDG ELEVN
> WHEN PACK OVHT OUT
☐                          DEFRD RECALL

> AT FL100 (WINDOW CRACKED)
☐                          DEFRD RECALL

> AT TOP OF DES : CAB PRESS MGMT
☐                              ACTIVATE
  PACK 2.............................OFF
 ?  CABIN V/S EXCEEDS 1000 FT/MIN ?
  ☐ YES
   PACK 1............................OFF
  ☐ DESCENT TO FL100/MEA-MORA....INITIATE
  ☐ MAX FL: FL100/MEA-MORA

   WHEN DIFF PREE < 2 PSI & FL < 100/MEA

   RAM AIR............................ON
```

PURPOSE

The DEFERRED PROCEDURE LIST page enables the flight crew to:

- Display the content of a deferred procedures as long as the flight crew does not activate the procedure
- Activate a deferred procedure
- Recall the display of an activated deferred procedure on the WD.

The deferred procedures are displayed by order of priority in the list.

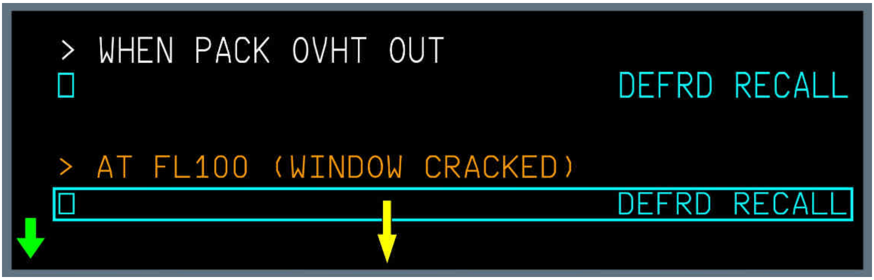
ACCESS

The flight crew can access the DEFERRED PROCEDURE LIST page via the DEFRD pb on the ECP.

SELECTION BOX

The flight crew can scroll the list of the deferred procedures with the wheel of the ECP.

Scroll

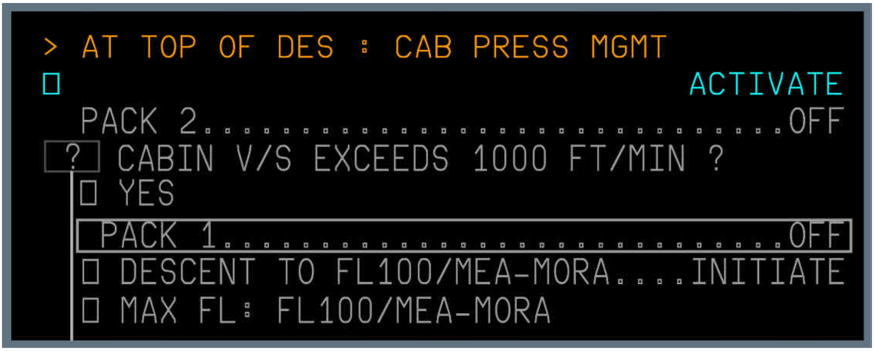


```
> WHEN PACK OVHT OUT
☐                                  DEFRD RECALL

> AT FL100 (WINDOW CRACKED)
☐                                  DEFRD RECALL
```

When the flight crew scrolls the selection box inside the content of a not-active deferred procedure, the selection box becomes gray, as no flight crew action is available.

Gray Selection Box



```
> AT TOP OF DES : CAB PRESS MGMT
☐                                      ACTIVATE
  PACK 2..............................OFF
 ?  CABIN V/S EXCEEDS 1000 FT/MIN ?
  ☐ YES
    PACK 1............................OFF
  ☐ DESCENT TO FL100/MEA-MORA....INITIATE
  ☐ MAX FL: FL100/MEA-MORA
```

OVERFLOW INDICATORS

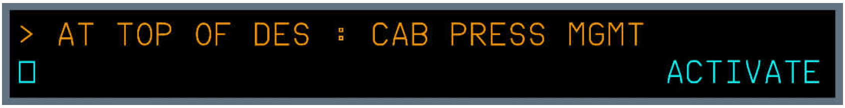
Overflow indicators appears on the left part of the screen to indicate that more deferred procedures are available above or below the current display.

⬇	Appears at the bottom left of the screen to indicate that the list of the deferred procedures continues below the current display.

⬆	Appears at the top left of the screen, to indicate that the list of the deferred procedures starts above the current display.

NOT-ACTIVE DEFERRED PROCEDURE

The deferred procedures that are not active yet are displayed in the list with an amber title.
This is the case, every time a new procedure appears in the list.
An ACTIVATE action line enables the flight crew to activate the procedure.



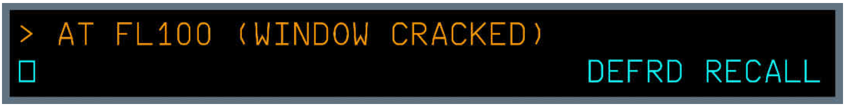
```
> AT TOP OF DES : CAB PRESS MGMT
□                         ACTIVATE
```

Not-Active Deferred Procedure

The entire content of the procedure is displayed in gray, with all the available conditions.
Therefore, the flight crew can read the entire procedure in the DEFERRED PROCEDURES LIST page, before the activation.
The title of the deferred procedure enables the flight crew to decide when the activation of the procedure is appropriate.
When the flight crew activates a deferred procedure, the procedure is displayed on the WD as any other active procedure.
L2 For information on how the active procedures appear on the WD, *Refer to DSC-31-CDS-60-10-40 Active ECAM Procedure*.

L1 ACTIVE DEFERRED PROCEDURE

The deferred procedures that the flight crew manually activated are displayed in the list with an amber title, when they are not completed yet.
The content of the procedure is no longer displayed.
A DEFRD RECALL action line enables the flight crew to display again the procedure, on the WD.



```
> AT FL100 (WINDOW CRACKED)
□                     DEFRD RECALL
```

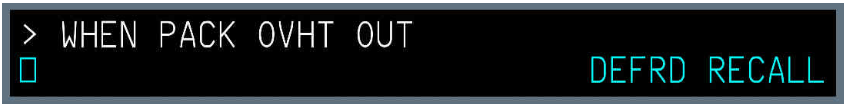
Active Deferred Procedure

DEFERRED PROCEDURE COMPLETED

The deferred procedures that the flight crew already completed, remains in the list of the deferred procedures with a white title.
The content of the procedure is no longer displayed on the DEFERRED PROCEDURE LIST page.

A DEFRD RECALL action line enables the flight crew to display again the procedure, on the WD.

Deferred Procedure Completed



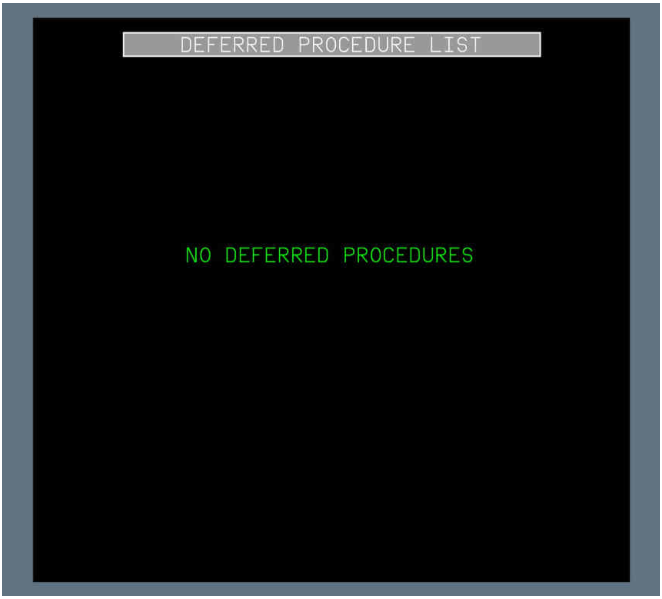
```
> WHEN PACK OVHT OUT
☐                                    DEFRD RECALL
```

NO DEFERRED PROCEDURE

If the flight crew presses the DEFRD pb and there is no deferred procedures, the WD displays the NO DEFERRED PROCEDURE message.

L2 The messages appears during 3 s, then the DEFERRED PROCEDURE LIST page disappears.

No Deferred Message



```
DEFERRED PROCEDURE LIST

NO DEFERRED PROCEDURES
```

ACTIVE ECAM PROCEDURE

Applicable to: ALL

Ident.: DSC-31-CDS-60-10-40-30-00000022.0001001 / 24 APR 14

The abnormal or emergency ECAM procedures that can be active are:

- ECAM sensed procedures that the ECAM automatically activates, when a system detects a failure
- ECAM abnormal not-sensed procedures that the flight crew manually activated

L2 For more information about manual activation of not-sensed procedures, *Refer to DSC-31-CDS-60-10-40 Abnormal Not-Sensed Procedures*

L1 - ECAM deferred procedures that the flight crew manually activated.

L2 For more information about manual activation of deferred procedures, *Refer to DSC-31-CDS-60-10-40 Deferred Procedures*

For more information about abnormal procedure description in FCOM, *Refer to PRO-ABN-ABN-00 Introduction*.

L1 Several abnormal or emergency procedures can be active at the same time. However, the WD only displays the content of only one procedure at a time, in accordance with the priority of each procedure.

Note: *When the flight crew activates an abnormal not-sensed procedure, the WD displays the abnormal not-sensed procedure as the first procedure to be applied, regardless of the priority of the other active procedures.*
However, if the ECAM triggers an alert associated with a sensed procedure while the flight crew applies an abnormal not-sensed procedure, the WD displays the active procedures in the order in which the flight crew should apply them.

```

Ident.: DSC-31-CDS-60-10-40-30-00000312.0001001 / 24 APR 14

PURPOSE

The WD displays an active procedure to enable the flight crew to apply the procedure.

Ident.: DSC-31-CDS-60-10-40-30-00000315.0001001 / 24 APR 14

ACCESS

The WD displays active ECAM procedures as soon as a procedure becomes active.

Ident.: DSC-31-CDS-60-10-40-30-00000023.0001001 / 24 APR 14

TITLE

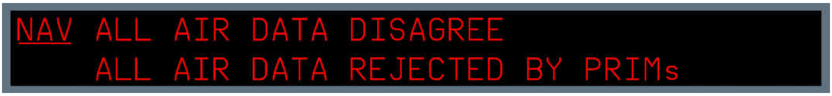
The title of the procedure appears in:
- Red, for emergency procedures
- Amber, for abnormal procedures.

The display of the procedure title depends on the type of the procedure (independent, primary, or secondary). For more information, *Refer to DSC-31-CDS-60-10-10 Alert Types*.
When the WD displays a deferred procedure, the DEFRD label appears before the title of the deferred procedure (e.g. DEFRD FOR LANDING (HYD G+Y SYS PRESS LO))

SUBTITLE

When necessary, a subtitle can appear below the title:

Subtitle

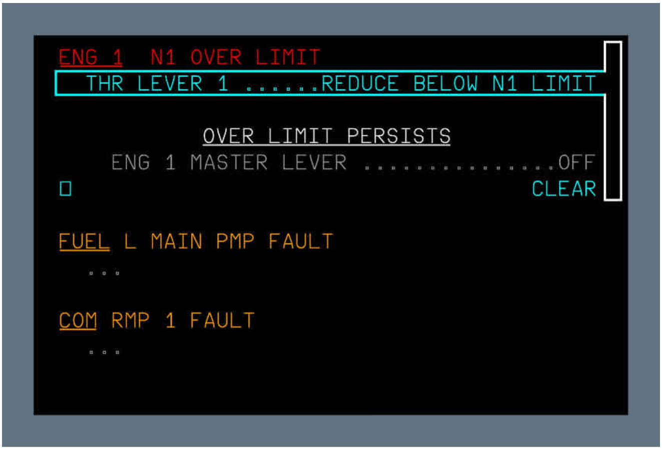


NAV ALL AIR DATA DISAGREE
ALL AIR DATA REJECTED BY PRIMs

SIMULTANEOUSLY-DISPLAYED PROCEDURES

If several alerts are triggered at the same time, the WD displays the procedures that are associated with these alerts in decreasing order of priority.
The WD first displays the procedure that is associated with the alert that has the highest priority, and that the flight crew should apply first. For the other procedures, the WD displays their title with the ... indication, instead of the procedure lines.

Simultaneously-Displayed Procedures - Example



```
ENG 1  N1 OVER LIMIT
  THR LEVER 1 .......REDUCE BELOW N1 LIMIT

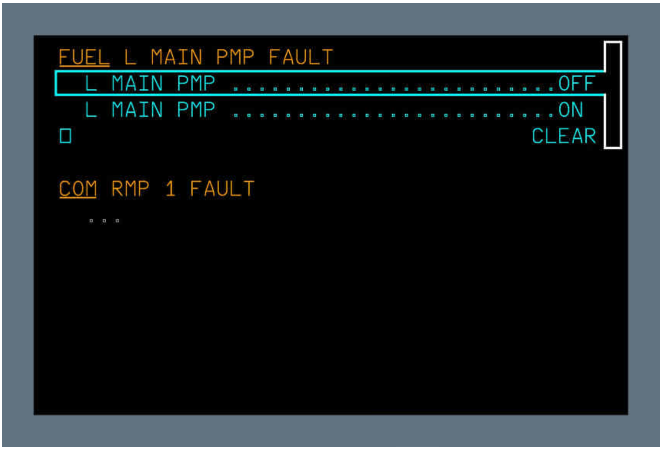
           OVER LIMIT PERSISTS
    ENG 1 MASTER LEVER ...............OFF
☐                                   CLEAR

FUEL L MAIN PMP FAULT
   ▫ ▫ ▫

COM RMP 1 FAULT
   ▫ ▫ ▫
```

When the flight crew clears the first procedure, the procedure lines of the next procedure appear below the corresponding title, instead of the ▫ ▫ ▫ indication.

Simultaneously-Displayed Procedures - After Clear - Example



```
FUEL L MAIN PMP FAULT
  L MAIN PMP .........................OFF
  L MAIN PMP .........................ON
☐                                   CLEAR

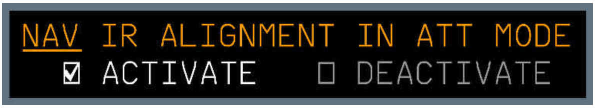
COM RMP 1 FAULT
   ▫ ▫ ▫
```

Ident.: DSC-31-CDS-60-10-40-30-00015649.0001001 / 24 APR 14

ACTIVATION LINE

When the flight crew activated an abnormal not-sensed procedure, or a deferred procedure the procedure displays an activation line on top of the procedure to enable the flight crew to deactivate the procedure.

Activation Line



NAV IR ALIGNMENT IN ATT MODE
☑ ACTIVATE ☐ DEACTIVATE

When the flight crew deactivates a procedure then all associated limitations, memos, information and associated deferred procedures are removed.
The activation line is not displayed for sensed alerts.

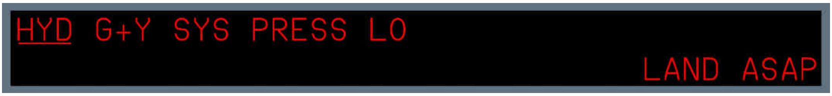
Ident.: DSC-31-CDS-60-10-40-30-00000024.0001001 / 24 APR 14

LAND ASAP / LAND ANSA

In some abnormal or emergency cases, the ECAM indicates, below the title of the procedure:

- LAND ASAP
  For more information about the LAND ASAP definition and expected flight crew action, *Refer to GEN Definitions*.

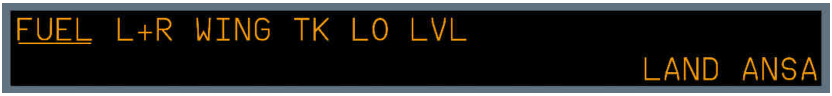
LAND ASAP - Example



HYD G+Y SYS PRESS LO
LAND ASAP

- LAND ANSA
  For more information about the LAND ANSA definition and expected flight crew action, *Refer to GEN Definitions*.

LAND ANSA - Example



FUEL L+R WING TK LO LVL
LAND ANSA

Note: *LAND ASAP and LAND ANSA also appear in the memos section of the WD and on the PFD.*

Ident.: DSC-31-CDS-60-10-40-30-00000025.0001001 / 24 APR 14

SELECTION BOX

A selection box appears around the applicable procedure line. When the flight crew validates or completes the procedure line, the selection box automatically moves to the next applicable procedure line.
However, the flight crew can manually move the selection box, via the wheel of the ECP, in order to select any line of the procedure.

The selection box is either:
- Blue, when the boxed line corresponds to an action to be performed, or
- Gray, if the boxed line is not yet activated .
  (e.g. in a sensed procedure step that is not active yet).

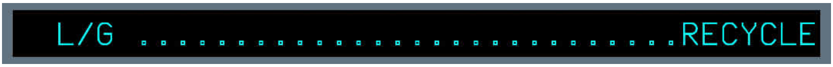
Ident.: DSC-31-CDS-60-10-40-30-00000026.0001001 / 24 APR 14

SENSED ACTION LINE

The ECAM procedures have action lines for which the ECAM can detect that the corresponding actions are completed.

These sensed action lines appear as follows:
- When the action is not completed, the action line is in blue

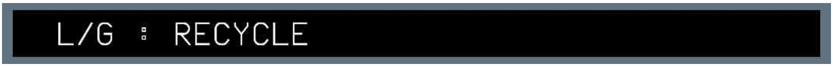
Sensed Action Line - Not Completed - Example



```
L/G ............................RECYCLE
```

- When the flight crew completes the action, the action line appears in white.

Sensed Action Line - Completed - Example



```
L/G : RECYCLE
```

Ident.: DSC-31-CDS-60-10-40-30-00000027.0001001 / 24 APR 14

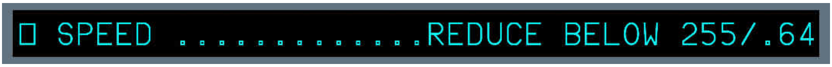
NOT-SENSED ACTION LINE

The ECAM procedures have item lines for which the ECAM cannot detect that the corresponding actions are completed.

A square appears before these not-sensed action lines, as follows:

- When the action is not completed, the action line is in blue

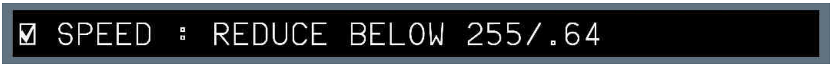
Not-Sensed Action Line - Not Completed - Example



☐ SPEED ....REDUCE BELOW 255/.64

- When the action is completed and the flight crew validates the action line, the action line appears in white.

Not-Sensed Action Line - Completed - Example



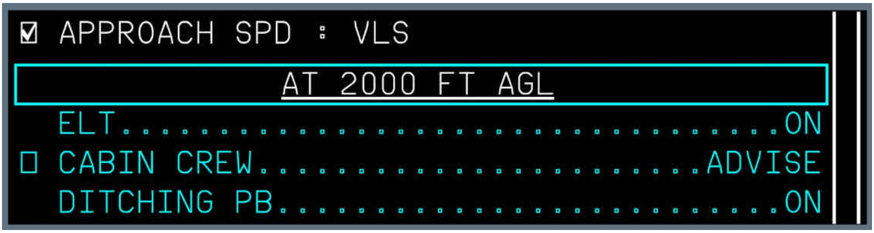
☑ SPEED : REDUCE BELOW 255/.64

Ident.: DSC-31-CDS-60-10-40-30-00001154.0001001 / 24 APR 14

CONDITIONS

NOT-SENSED PROCEDURE STEP

Procedure Step



☑ APPROACH SPD : VLS

AT 2000 FT AGL

ELT..................................ON

☐ CABIN CREW..........................ADVISE

DITCHING PB..........................ON

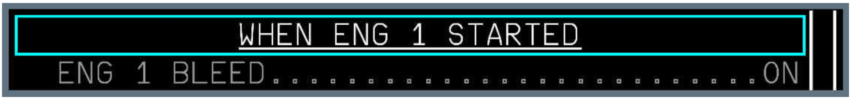
The not-sensed procedure step is a block of ECAM lines that the flight crew must perform at the appropriate time.

SENSED PROCEDURE STEP

A sensed procedure step is a block of ECAM lines that appears in grey, until the ECAM detects the flight crew can perform related actions.

Step Condition Not-Satisfied

Sensed Condition Not-Satisfied



WHEN ENG 1 STARTED

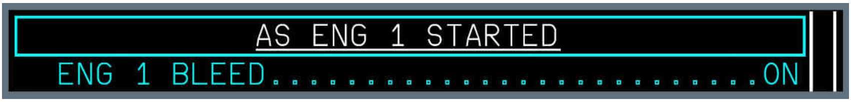
ENG 1 BLEED...........................ON

The block of actions associated with the condition is not applicable (grey color).

The flight crew must wait the condition is satisfied to continue the procedure.

Step Condition Satisfied

Sensed Condition Satisfied



AS ENG 1 STARTED

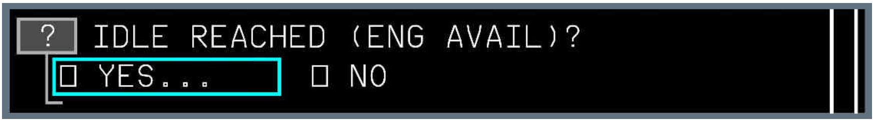
ENG 1 BLEED..........................ON

When the condition is satisfied, the colors of the ECAM lines change from grey to blue, and the text of the condition changes to start with "AS" . Then, the flight crew can complete the remaining applicable actions that are associated with the condition.
When a confirmation time is necessary to perform more actions (e.g. for landing gear extension), the ECAM step contains a countdown timer.

YES/NO QUESTION

For some abnormal procedures the ECAM can display a question with a YES/NO answer, when a manual confirmation is required from the flight crew to continue the procedure.

YES/NO

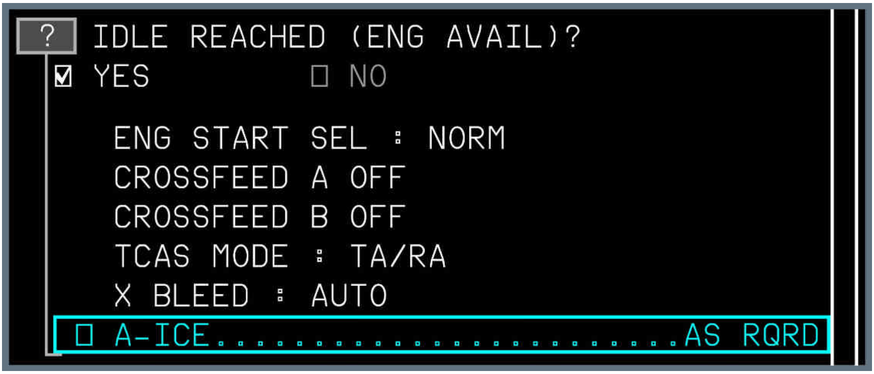


? IDLE REACHED (ENG AVAIL)?

☐ YES...   ☐ NO

The content associated to each choice is displayed only when the answer is ticked. However the "..." after the YES or NO selection indicates if the choice contain actions. In the above example only the YES choice has associated actions. The "NO" choice answers the ECAM question without associated action.
When the flight crew selects an answer, the ECAM displays the associated actions to perform.

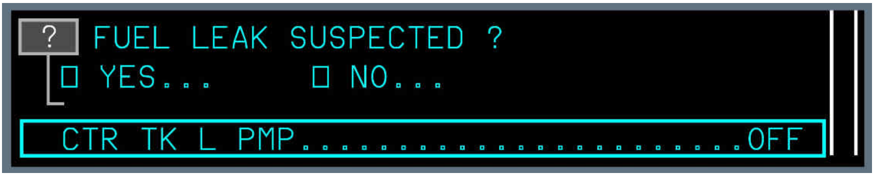
Open Condition



? IDLE REACHED (ENG AVAIL)?
☑ YES ☐ NO
ENG START SEL : NORM
CROSSFEED A OFF
CROSSFEED B OFF
TCAS MODE : TA/RA
X BLEED : AUTO
☐ A-ICE..........................AS RQRD

If the flight crew scrolls down the procedure and do not select an answer at the ECAM question, the ECAM question becomes blue.

Condition Not-Checked

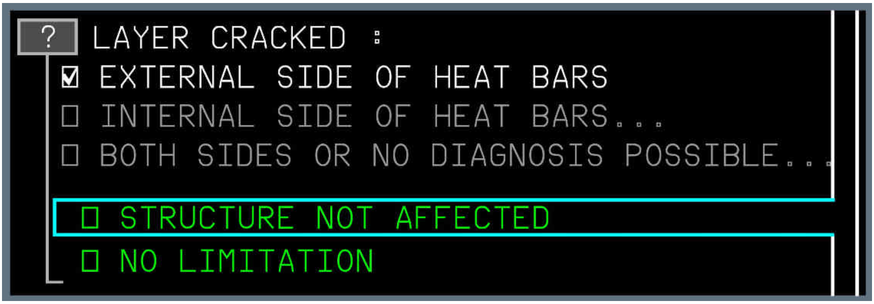


? FUEL LEAK SUSPECTED ?
☐ YES... ☐ NO...
CTR TK L PMP.......................OFF

MULTIPLE CHOICES

When more than two choices are available, the ECAM question displays the different possibilities. As for the YES/NO choice, the "..." after each possibility indicates that more content will be available when the choice is ticked.
When the flight crew selects an answer, the ECAM displays the associated actions as below.

Multiple Choices



```
? LAYER CRACKED :
  ☑ EXTERNAL SIDE OF HEAT BARS
  ☐ INTERNAL SIDE OF HEAT BARS...
  ☐ BOTH SIDES OR NO DIAGNOSIS POSSIBLE...
    ☐ STRUCTURE NOT AFFECTED
    ☐ NO LIMITATION
```

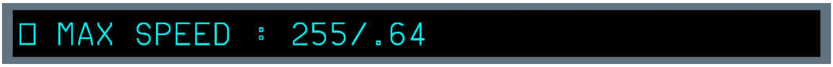
Ident.: DSC-31-CDS-60-10-40-30-00009751.0001001 / 24 APR 14

LIMITATION LINE

Some ECAM procedures have lines that indicate limitations.

The limitation lines appear as follows:
- When the limitation line is not validated, the line is in blue

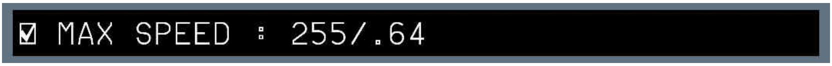
Limitation Line - Not Validated - Example



```
☐ MAX SPEED : 255/.64
```

- When the flight crew acknowledges the limitation by validating the limitation line, the limitation line appears in white.

Limitation Line - Validated - Example



```
☑ MAX SPEED : 255/.64
```

Note: *The limitations also appear in the LIMITATIONS section of the WD, and, if applicable, on the PFD. For more information about limitations on the WD and PFD, Refer to DSC-31-CDS-60-10-40 Limitations.*

Ident.: DSC-31-CDS-60-10-40-30-00000306.0001001 / 24 APR 14

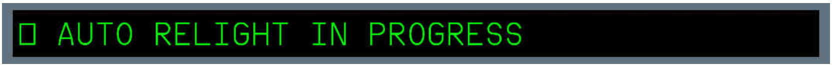
INFORMATION LINE

Some ECAM procedures have lines that provide information.

The information lines appear as follows:

- When the information line is not validated, the information line is in green

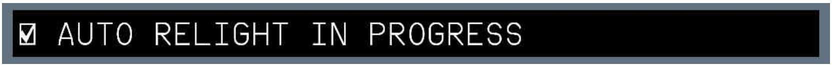
Information Line - Not Validated - Example



☐ AUTO RELIGHT IN PROGRESS

- When the flight crew acknowledges the information by validating the information line, the information line appears in white.

Information Line - Validated - Example



☑ AUTO RELIGHT IN PROGRESS

Ident.: DSC-31-CDS-60-10-40-30-00001157.0001001 / 15 APR 19

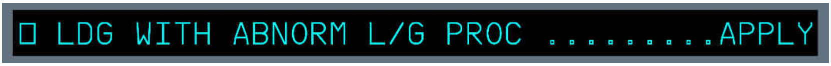
PROC APPLY OR PROC CONSIDER ACTION LINE

Some ECAM procedures have an action line that requests the flight crew to refer to another procedure.

The action line appears as follows, depending on the requested action:

- Name of the abnormal not-sensed procedure...........APPLY
  The flight crew stops applying the current ECAM procedure, and immediately begins to apply the indicated abnormal not-sensed procedure. The flight crew resumes and completes the current ECAM procedure, after the flight crew completes the indicated abnormal not-sensed procedure.

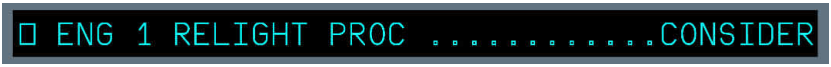
Abnormal Not-Sensed PROC....APPLY - Example



☐ LDG WITH ABNORM L/G PROC ....APPLY

- Name of the abnormal not-sensed procedure..........CONSIDER
  The flight crew should consider the application of the indicated abnormal not-sensed procedure, depending on the situation (e.g. remaining flight time, flight conditions, or when time permits after the flight crew completes the current ECAM procedure). The flight crew can validate the action line without immediately applying the indicated abnormal not-sensed procedure.

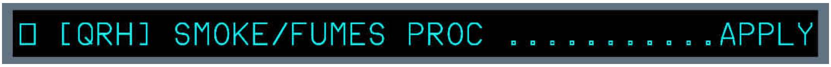
Abnormal Not-Sensed PROC....CONSIDER - Example



☐ ENG 1 RELIGHT PROC ....CONSIDER

- [QRH] Name of the procedure..........APPLY
  The flight crew stops applying the current ECAM procedure, and immediately begins to apply the indicated procedure in the Quick Reference Handbook (QRH). The flight crew resumes and completes the current ECAM procedure, after the flight crew completes the indicated QRH procedure.

[QRH] PROC....APPLY - Example



☐ [QRH] SMOKE/FUMES PROC ....APPLY

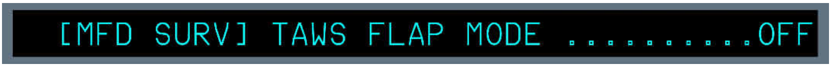
Ident.: DSC-31-CDS-60-10-40-30-00001155.0001001 / 24 APR 14

INFORMATION BETWEEN BRACKETS

Some ECAM procedures have action lines with information between brackets.

Information between brackets indicates:
- The associated MFD page on which to perform the ECAM action, or

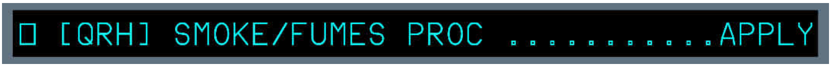
Action on MFD Page - Example



```
[MFD SURV] TAWS FLAP MODE ..........OFF
```

- That the procedure to be applied is in the QRH.

QRH Procedure - Example



```
☐ [QRH] SMOKE/FUMES PROC ...........APPLY
```

Ident.: DSC-31-CDS-60-10-40-30-00000031.0001001 / 24 APR 14

OVERFLOW INDICATION

When a procedure contains many lines, or when several alerts are simultaneously triggered, the WD may not be able to display all lines at the same time.

In these cases, a green down-arrow symbol (⬇) appears at the bottom left of the screen to indicate that the procedure continues below the current display.

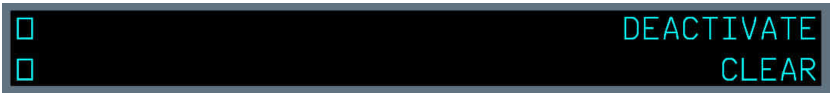
When the flight crew scrolls down, a green up-arrow symbol (⬆) appears at the top left of the procedure, below the title of the procedure, to indicate that the procedure starts above the current display. The title of the procedure always appears.
If the next applicable line of a procedure is in overflow, the WD automatically scrolls down line by line to display the next procedure lines.

Ident.: DSC-31-CDS-60-10-40-30-00009626.0001001 / 06 MAR 15

DEACTIVATE ACTION LINE

Some of the abnormal not-sensed procedures have a DEACTIVATE action line before the CLEAR line, at the end of the procedure.

DEACTIVATE Action Line



```
☐                                 DEACTIVATE
☐                                      CLEAR
```

When an active abnormal not-sensed procedure is no longer applicable, the flight crew must manually deactivate it, in order to remove the limitations, information, and deferred procedures that are associated with the abnormal not-sensed procedure.

An abnormal not-sensed procedure can be no longer applicable:
- When the conditions that caused the activation of the abnormal not-sensed procedure disappear (e.g. there is no longer turbulence), or
- Immediately after the flight crew completes the abnormal not-sensed procedure (e.g. ENG RELIGHT IN FLIGHT).

The DEACTIVATE line has the same effect as the DEACTIVATE selection of the activation line on the top of the procedure.

Ident.: DSC-31-CDS-60-10-40-30-00000030.0001001 / 24 APR 14

CLEAR BAR

When it is possible to clear procedure lines, a clear bar appears on the right side of the WD.

This clear bar indicates the procedure lines that can be cleared. To clear these applicable procedure lines, the flight crew can either:
- Validates the CLEAR action line, or
- Press the CLEAR pb on the ECP.

In the case of simultaneously-displayed ECAM procedures, the clear bar appears on the right side of the first procedure. When the flight crew clears the procedure, the clear bar moves to the next procedure.

L2 The clear bar only appears, when the selection box is on the first procedure to apply.

Ident.: DSC-31-CDS-60-10-40-30-00000032.0001001 / 24 APR 14

CLEAR ACTION LINE

When validated, clears the procedure lines that are associated with the clear bar.

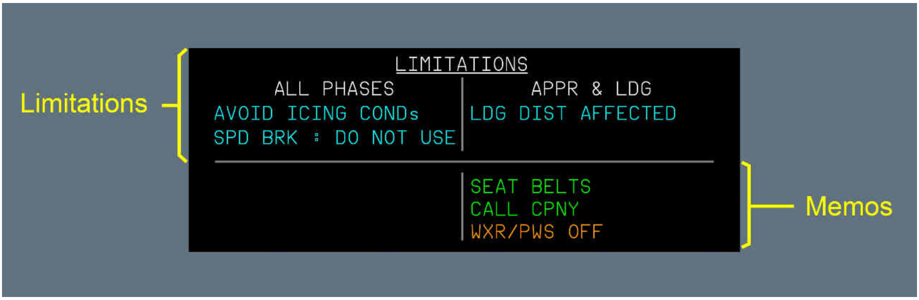
LIMITATIONS AND MEMOS

Applicable to: ALL

Ident.: DSC-31-CDS-60-10-40-35-00018766.0001001 / 24 APR 14

The limitations and memos page is the default page of the WD, when:
- No abnormal procedure is active
- The ABNORMAL NOT-SENSED PROCEDURES menu is not displayed
- The DEFERRED PROCEDURES LIST page is not displayed.

Overview



LIMITATIONS
ALL PHASES
AVOID ICING CONDs
SPD BRK : DO NOT USE
APPR & LDG
LDG DIST AFFECTED
SEAT BELTS
CALL CPNY
WXR/PWS OFF

L2 There is only one page to display memos and limitations. As a consequence, if the limitations and memos exceed the display, some of the memos or limitations does not appear on the WD.

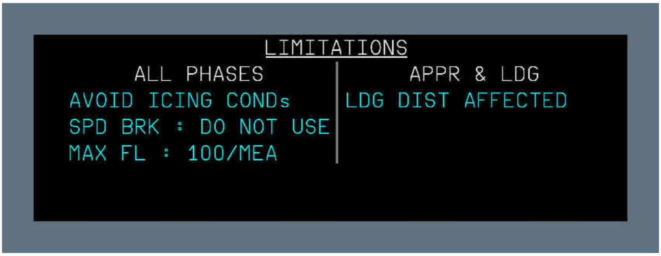
Ident.: DSC-31-CDS-60-10-40-35-00000041.0001001 / 24 APR 14

LIMITATIONS

A limitation is an operational constraint that is applicable after a system failure.

A limitation can appear on the WD only, or on both the PFD and the WD:
- A limitation appears on both the WD and the PFD, when the limitation has an immediate effect on the flight (e.g. MAX FL : 100/MEA)
  For more information about Limitations on PFD, *Refer to DSC-31-CDS-40-30 Limitations*.
- In all other cases (e.g. LDG DIST AFFECTED), limitations appear on the WD only.

Limitations appear in blue.



LIMITATIONS
ALL PHASES
AVOID ICING CONDs
SPD BRK : DO NOT USE
MAX FL : 100/MEA
APPR & LDG
LDG DIST AFFECTED

The WD displays limitations in two columns:
- The left column (ALL PHASES) displays the limitations that are applicable to all flight phases
- The right column (APPR & LDG) displays the limitations that are only applicable to the approach phase, or to the landing phase, or to both the approach and landing phases.

The first line of each column displays the most important limitation. All other limitations are listed in the order of most to least important.

L12

Note: *During some flight phases, the WD may temporarily clear some limitations, in order to optimize the information display. This may occur, for example, when the T.O or LDG memo is displayed, because there is no sufficient space on the screen to display all the memos and limitations.*

The WD clears limitations:

- *If they also appear on the PFD*
- *In the order of least to most important.*

Ident.: DSC-31-CDS-60-10-40-35-00000042.0001001 / 07 JAN 16

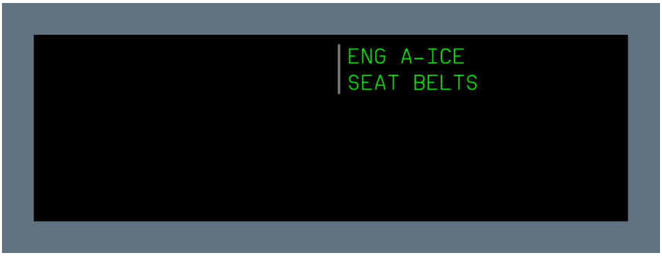
MEMOS

A memo indicates the status of an aircraft system, and usually appears as a reminder:

- After a specific flight crew action or selection
- To indicate the automatic function of a system
- To indicate a LAND ASAP or LAND ANSA.

A memo can appear on the WD only, or on both the PFD and the WD:

- Memos that appear on both the PFD and the WD are memos to increase the flight crew awareness (e.g. ENG A-ICE).
  For more information about the display of memos on the PFD, *Refer to DSC-31-CDS-40-30 MEMOs*
- Other memos (e.g. SEAT BELTS) appear on the WD only.



```
ENG A-ICE
SEAT BELTS
```

The WD displays memos in two columns:

- The left column displays the Takeoff (T.O) and Landing (LDG) memos
- The right column displays all other memos.

L2 Most of memos are not inhibited. Nevertheless, the ECAM can inhibit a memo during specific flight phases. For more information about memo inhibition, *Refer to DSC-31-CDS-60-10-10 ECAM Flight Phases*.

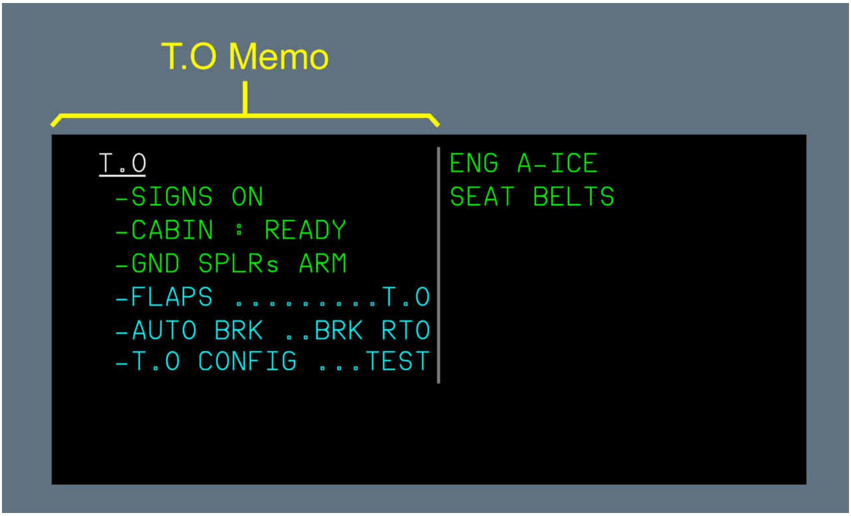
L1 T.O AND LDG MEMOS (LEFT COLUMN)

The T.O and LDG memos provide the flight crew with the list of actions to be performed before takeoff and landing:

- Actions that are not completed yet, appears in blue
- Actions that are already completed appear in green.

Note: In accordance with the Standard Operating Procedures (SOP), the flight crew must ensure that all memo items are green before takeoff and landing.

T.O Memo



```
T.O                        ENG A-ICE
 -SIGNS ON                 SEAT BELTS
 -CABIN : READY
 -GND SPLRs ARM
 -FLAPS .........T.O
 -AUTO BRK ..BRK RTO
 -T.O CONFIG ...TEST
```

L2 *Note: The T.O memo illustration shows the optional CABIN : READY ◁ indication.*

L1 The T.O memo automatically appears 2 min after the first engine start.

The flight crew can manually display the T.O memo when the flight crew presses the T.O CONFIG pb on the ECP, and:

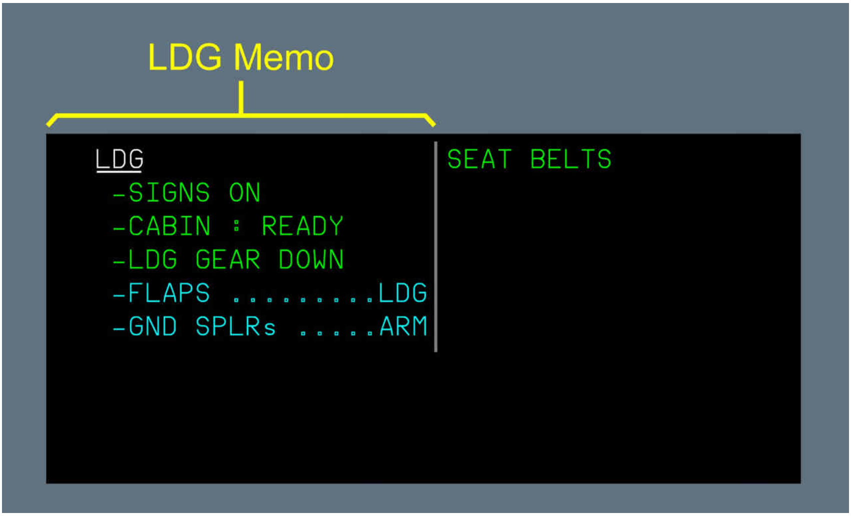
- The aircraft is on the ground with at least one engine running
- There is no engine at takeoff power.

The T.O memo disappears, when the flight crew applies the takeoff power.

Note: *The T.O memo items are also part of the BEFORE TAKEOFF checklist.*

For more information about T.O configuration test, *Refer to DSC-31-CDS-60-30 Takeoff Configuration Test*.

LDG Memo



```
LDG                          SEAT BELTS
 -SIGNS ON
 -CABIN : READY
 -LDG GEAR DOWN
 -FLAPS .........LDG
 -GND SPLRs .....ARM
```

Note: *The LDG memo illustration shows the optional CABIN : READY* ⊲✳ *indication.*

The LDG memo automatically appears, when the aircraft descends below 2 000 ft radio height.

The LDG memo disappears after landing:
- One minute after the speed goes below 80 kt
- If the flight crew applies takeoff power.

Note: *The LDG memo items are also part of the LANDING checklist.*

ALL PHASE MEMOS (RIGHT COLUMN)

The right column displays memos that are applicable to all phases.
Memos are displayed in accordance with memo importance. The first line displays the most important memo.
Memos usually appear in green. However, some memos may appear in amber (e.g. A/THR OFF), in red (e.g. AP OFF), or in magenta (e.g. T.O INHIBIT).

REMINDERS

Applicable to: ALL

Ident.: DSC-31-CDS-60-10-40-40-00000033.0001001 / 24 APR 14

The following reminders can appear on the last line of the limitations and memos pages of the WD:

- The DISPCH reminder
- The ADV reminder
- The STS reminder
- The STS & DEFRD PROC reminder.

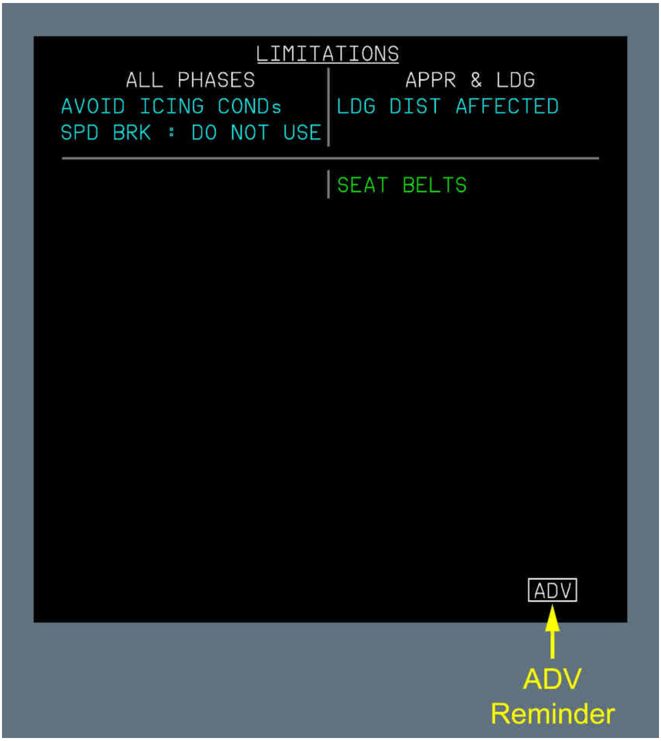
Ident.: DSC-31-CDS-60-10-40-40-00000107.0001001 / 24 APR 14

ADV REMINDER

The ADV reminder appears and pulses on the WD, if all of the following apply:

- There is an advisory condition for an aircraft system
L2 For more information about advisory, *Refer to DSC-31-CDS-60-10-10 Advisory*.
L1
- The WD displays the page dedicated to limitations and memos.

ADV Reminder



LIMITATIONS

ALL PHASES
AVOID ICING CONDs
SPD BRK : DO NOT USE

APPR & LDG
LDG DIST AFFECTED

SEAT BELTS

The ADV reminder disappears from the WD, when:

- The flight crew presses the ECP pushbutton that is associated with the affected SD page, or
- The parameter, source of the advisory indication, returns to its defined operational range.

Ident.: DSC-31-CDS-60-10-40-40-00000108.0001001 / 24 APR 14

STS REMINDER

The STS reminder appears on the WD, if all of the following apply:

- The STATUS page is not empty

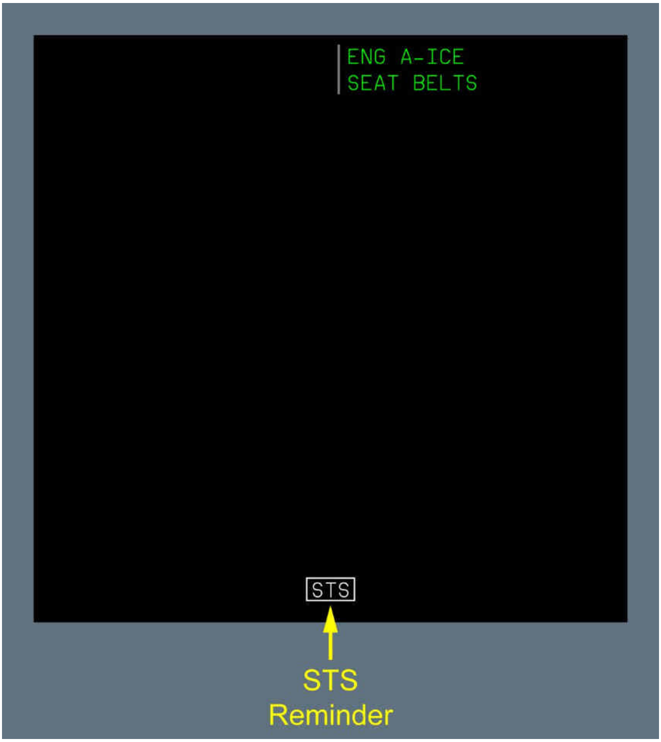
L2 For more information about the STATUS page, *Refer to DSC-31-CDS-60-10-50 STATUS Page and STATUS MORE Page*.

L1 - The DEFERRED PROCEDURES page is empty

L2 For more information about the DEFERRED PROCEDURES page, *Refer to DSC-31-CDS-60-10-40 Deferred Procedures*.

L1 - The WD displays memos or limitations.

STS Reminder



Ident.: DSC-31-CDS-60-10-40-40-00000109.0001001 / 24 APR 14

STS & DEFRD PROC REMINDER

The STS & DEFRD PROC reminder appears on the WD, if all of the following apply:

- The STATUS page is not empty

L2 For more information about the STATUS page, *Refer to DSC-31-CDS-60-10-50 STATUS Page and STATUS MORE Page*.

L1
- There are deferred procedures available in the DEFERRED PROCEDURES page.

L2 For more information about the DEFERRED PROCEDURES page, *Refer to DSC-31-CDS-60-10-40 Deferred Procedures*.

L1
- The WD displays memos or limitations.

SD

OVERVIEW

Ident.: DSC-31-CDS-60-10-50-00000035.0001001 / 24 APR 14
Applicable to: ALL

The SD displays the:
- SD pages: *Refer to DSC-31-CDS-60-10-50 SD Pages*
- STATUS page and STATUS MORE page: *Refer to DSC-31-CDS-60-10-50 STATUS Page and STATUS MORE Page*
- The DISPATCH page: *Refer to DSC-31-CDS-60-10-50 DISPATCH Page*
- Video: *Refer to DSC-31-CDS-110-10 Overview*.

The flight crew uses the ECP to interface with the SD.

SD PAGES

Ident.: DSC-31-CDS-60-10-50-00000036.0001001 / 04 MAY 18
Applicable to: ALL

The SD pages provide information about aircraft systems.

The following SD pages are available:
- APU SD page
  Provides information about APU: *Refer to DSC-49-20 APU SD Page*.
- BLEED SD page

  Provides information about bleed air and air conditioning:
  - For bleed air: *Refer to DSC-36-20 BLEED SD Page*
  - For air conditioning: *Refer to DSC-21-COND-20 BLEED SD Page*
  - For wing anti-ice, *Refer to DSC-30-20-20 BLEED SD page*.
- C/B SD page
  Provides the list of the tripped circuit breakers: *Refer to DSC-24-20 ELEC C/B SD Page*.
- CAB PRESS SD page

  Provides information about air systems:
  - For air conditioning: *Refer to DSC-21-COND-20 CAB PRESS SD Page*
  - For ventilation: *Refer to DSC-21-VENT-20 CAB PRESS SD Page*
  - For pressurization: *Refer to DSC-21-PRESS-20 CAB PRESS SD page*.

- COND SD page

  Provides information about air systems and smoke detection:
  - For air conditioning: *Refer to DSC-21-COND-20 COND SD Page*
  - For ventilation: *Refer to DSC-21-VENT-20 COND SD Page*
  - For smoke detection in avionic bay, *Refer to DSC-26-60-20 COND SD Page*
  - For smoke detection in cargo compartment, *Refer to DSC-26-70-20 COND SD Page*.

- DOOR/OXYGEN SD page

  Provides information about doors, oxygen, and rain repellent ◁ fluid:
  - For cabin doors: *Refer to DSC-52-30-20 DOOR/OXYGEN SD page*
  - For cargo doors: *Refer to DSC-52-60-20 DOOR/OXYGEN SD page*
  - For avionics bay door: *Refer to DSC-52-20-20 DOOR/OXYGEN SD page*
  - For oxygen in the cockpit: *Refer to DSC-35-20-20 DOOR/OXYGEN SD Page*
  - For rain repellent ◁ fluid: *Refer to DSC-30-30-20 DOOR/OXYGEN SD page*.

- ELEC AC SD page

  Provides information about AC electrical power:
  - For in-flight configuration, *Refer to DSC-24-20 ELEC AC SD Page: In-Flight Configuration*
  - For on-ground configuration, *Refer to DSC-24-20 ELEC AC SD Page: On-Ground Configuration*.

- ELEC DC SD page
  Provides information about DC electrical power: *Refer to DSC-24-20 ELEC DC SD Page*.
- ENG SD page
  Provides information about engine secondary parameters: *Refer to DSC-70-20 ENG SD Page*.
- F/CTL SD page
  Provides information about flight controls, *Refer to DSC-27-10-20 F/CTL SD Page*.
- FUEL SD page
  Provides information about the fuel system: *Refer to DSC-28-20 FUEL SD Page*.
- HYD SD page
  Provides information about hydraulic power: *Refer to DSC-29-20 HYD SD Page*.
- WHEEL SD page

  Provides information about the landing gear and the associated systems:
  - For landing gear and doors, *Refer to DSC-32-10-20 WHEEL SD Page*
  - For braking system, *Refer to DSC-32-20-20 WHEEL SD Page*
  - For steering system, *Refer to DSC-32-30-20 WHEEL SD Page*
  - For landing gear monitoring system, *Refer to DSC-32-40-20 WHEEL SD Page*.

The SD pages appear:
- When the flight crew manually selects a SD page via the ECP, or
- Automatically.

The SD can also display:

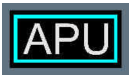
- The CRUISE page (See CRUISE page)
- The RWY CONDITION/BRAKING ACTION Matrix, *Refer to DSC-34-32-20-20-70 RWY CONDITION/BRAKING ACTION Matrix*.

For more information about SD page display, *Refer to DSC-31-CDS-60-30 Automatic SD Page Display*.

SD PAGE TITLE

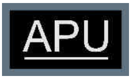
The title of a SD page appears as follows:
- In a blue box, when the flight crew manually displays the SD page

SD Page Title - Manual Display



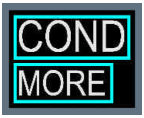
- Underlined in white, when the SD automatically displays the SD page

SD Page Title - Automatic Display



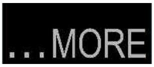
- In a blue box, when the flight crew manually selects the SD MORE page.

SD Page Title with MORE Page Selection



SD MORE PAGE

Some SD system displays have two pages available to provide additional information on the applicable system. In such a case,  appears below the name of the system.



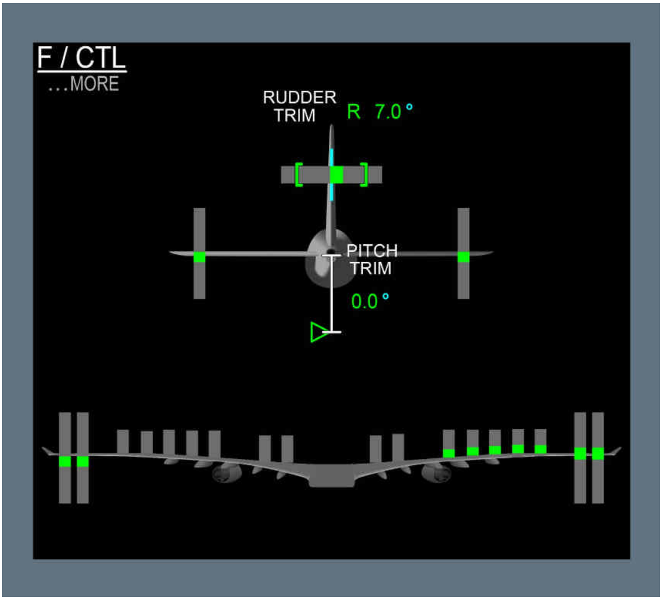
The MORE page is available but not active, the system page does not display all the available information.

MORE	The flight crew pressed the MORE pb on the ECP The MORE page is active, additional system information is displayed.

The following systems have a SD MORE page:
- The WHEEL page
- The COND page
- The F/CTL page.

The following page is an example of SD page with additional information available but not displayed.

SD Page with Basic Information



The following page is an example of SD page with additional information displayed when the flight crew selects the MORE page.

FUEL
CAB PRESS
COND

PURPOSE

The CRUISE page provides the flight crew with information about the fuel system and air systems, via three sections:

- FUEL
- CAB PRESS
- COND.

ACCESS

The flight crew cannot manually display the CRUISE page via the ECP.
The SD automatically displays the CRUISE page at 1 500 ft AGL, or at thrust reduction, depending on which one occurs first. Then, the CRUISE page remains the default-displayed page, until landing gear extension in approach.

FUEL

The FUEL section indicates the:
- Fuel flow per engine
- Fuel used per engine
- The difference between:
  - The current FOB plus the total fuel used by the two engines and the APU, and
  - The FOB at departure.

For more information about the FUEL section of the CRUISE page, *Refer to DSC-28-20 CRUISE SD Page - Upper Part*.

CAB PRESS

The CAB PRESS section indicates the:
- Differential pressure
- Cabin pressure and cabin vertical speed
- Landing elevation.

For more information about the CAB PRESS section of the CRUISE page, *Refer to DSC-21-PRESS-20 CRUISE Page*.

COND

The COND section indicates the temperature in the cockpit, cabin, and cargo compartments.
For more information about the COND section of the CRUISE page, *Refer to DSC-21-COND-20 CRUISE Page*.

XX DISPLAY ON SD PAGES

If a parameter value or status on any SD page is not available for display, XX appears, instead of the value or status.

 --------------ALERTS IMPACTING LDG PERF-------------
 F/CTL FLAPS LOCKED
                        MORE
```

PURPOSE

The STATUS page provides an operational summary of the aircraft state, via 5 sections:
- LIMITATIONS
- DEFERRED PROCEDURES
- INFO

- INOP SYS
- ALERTS IMPACTING LANDING PERF.

The above-listed sections appear, only if they are not empty.

ACCESS

The flight crew displays the STATUS page when:

- The STATUS page is not empty, and the flight crew clears the last alert on the WD via:
  - The CLEAR action line on the WD
  - The CLEAR pb on the ECP.
  - L2 The EMER CANC pb on the ECP.
- L1 The flight crew presses the STS pb on the ECP.

L2 The STATUS page can also automatically appear. For more information about the automatic STATUS page display, *Refer to DSC-31-CDS-60-30 Automatic STATUS Page Display*.

L1 LIMITATIONS

The LIMITATIONS label indicates that there are limitations.
These limitations appear on the WD only, or on the WD and the PFD.
L2 For more information, *Refer to DSC-31-CDS-60-10-40 Limitations*.

L1 DEFERRED PROCEDURES

The DEFERRED PROCEDURES section provides the list of the applicable deferred procedures by order of priority.

The titles of the applicable deferred procedures are:

- Amber, when the corresponding deferred procedures are not completed
- White, when the corresponding deferred procedures are completed.

The flight crew access the deferred procedures on the DEFERRED PROCEDURE LIST page, via the DEFRD pb on the ECP.
L2 For more information, *Refer to DSC-31-CDS-60-10-40 Deferred Procedures*.

L1 INFO

The INFO section provides information about any degraded aircraft system.
Information appears in green.

INOP SYS

The INOP SYS section makes a list of inoperative systems in two columns:
- The left column (ALL PHASES) displays the inoperative systems that are applicable to all flight phases
- The right column (APPR&LDG) displays the inoperative systems that are applicable to the approach phase, or to the landing phase, or to both the approach and landing phases.

The inoperative systems appear in amber.
The first line of each column displays the most important inoperative system. All other inoperative systems are listed in the order of most to least important.

ALERTS IMPACTING LDG PERF

The ALERTS IMPACTING LDG PERF section provides the list of the active alerts that affect the landing performance.
L2 For more information about landing distance computation, *Refer to FCTM/PR-AEP-LDC Landing Computation*.

L1 MORE

The MORE reminder appears on the last line of the SD, only if the STATUS MORE page is not empty.

The MORE reminder indicates that information is available on the STATUS MORE page: See STATUS MORE Page.

OVERFLOW INDICATION

When the SD cannot display the STATUS information on a single STATUS page, the SD displays the following message on the bottom of the STATUS page.

Overflow Indication

PRESS STS FOR NEXT STATUS PAGE

The flight crew can press the STS pb on the ECP to access the next STATUS pages, as long as the message appears. Several STATUS pages may be available.
When the SD displays the last STATUS page the PRESS STS FOR NEXT STATUS PAGE message disappears and the flight crew can press the STS pb on the ECP to remove the STATUS page.

INOP SYS REDUND

FLAP CTL 2

CANCELLED CAUTION

AIR ENG BLEED TEMP LO

HYD G RSVR AIR PRESS LO

IF HYDRAULIC IS RECOVERED CORRESPONDING LIMITATIONS WILL NOT APPLY

STATUS MORE Page

PURPOSE

The STATUS MORE page provides additional information about the aircraft state, via three sections:

- INOP SYS REDUND
- CANCELLED CAUTION
- MORE INFO.

The above-listed sections appear, only if they are not empty.

ACCESS

The flight crew can access the STATUS MORE page via the STATUS page, by pressing the MORE pb on the ECP.

Note:

The flight crew can access the STATUS MORE page, only if the MORE *reminder appears at the bottom of the STATUS page.*

INOP SYS REDUND

The INOP SYS REDUND section provides the list of the system redundancy losses that are associated with the active alerts.
The system redundancy losses appear in amber.
The first line displays the most important system redundancy loss. All other system redundancy losses are listed in the order of most to least important.

CANCELLED CAUTION

The CANCELLED CAUTION section provides the list of the cautions that the flight crew cancelled by using the EMER CANC pb on the ECP.
The titles of the cancelled cautions are in white.

MORE INFO

The lower section of the STATUS MORE page provides additional information related to procedures. This section is referred to as MORE INFO.
The information appears in white.
If the MORE INFO is not the first-displayed section on the STATUS MORE page, a separation line appears above the MORE INFO.

OVERFLOW INDICATION

When the SD cannot display the STATUS MORE information on a single STATUS page, the SD displays the following message on the bottom of the STATUS page.

Overflow Indication

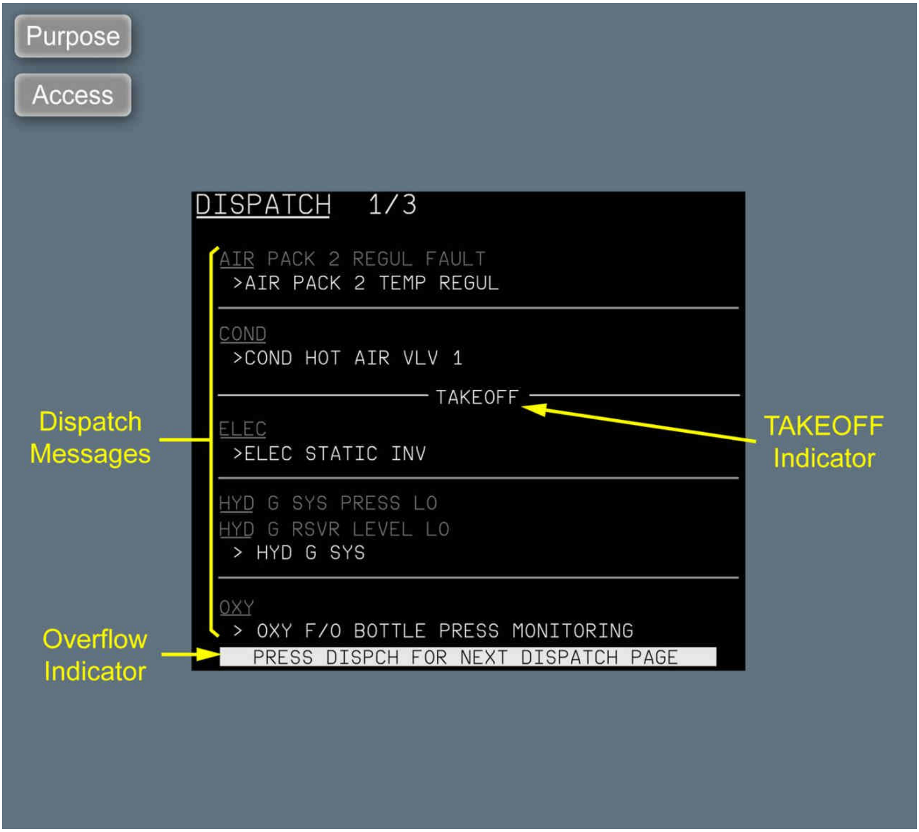
PRESS MORE FOR NEXT MORE PAGE

The flight crew can press the MORE pb on the ECP to access the next STATUS MORE pages, as long as the message appears. Several STATUS MORE pages may be available.
When the SD displays the last STATUS MORE page the overflow message disappears and the flight crew can press the MORE pb on the ECP to remove the STATUS MORE page. Then, the SD displays the STATUS page.

DISPATCH PAGE

Ident.: DSC-31-CDS-60-10-50-00000038.0001001 / 02 JUL 14
Applicable to: ALL

DISPATCH Page



```

HYD G SYS PRESS LO
HYD G RSVR LEVEL LO
 > HYD G SYS

OXY
 > OXY F/O BOTTLE PRESS MONITORING
    PRESS DISPCH FOR NEXT DISPATCH PAGE
```

PURPOSE

The DISPATCH page provides the list of all current dispatch messages with the associated alerts, if available.
The dispatch messages enable the flight crew to identify failed equipment that can be detected, if there is an associated dispatch condition to consider.

ACCESS

The DISPATCH page appears when the flight crew presses the DISPCH pb on the ECP.

DISPATCH MESSAGES

The dispatch function computes all the dispatch messages associated to a system failure in order to display each dispatch message only one time with the associated system ECAM alerts, or the associated ECAM category.
The DISPATCH page displays the sequence of dispatch messages as they appeared, with the last dispatch message on the top of the list. A line separates each dispatch message.
As for ECAM alerts the display of the dispatch messages can be inhibited in accordance with ECAM flight phases.
When there is at least one dispatch message available, a reminder appears on the WD.

L3 *Note: The dispatch function also interfaces with the OPS LIBRARY on the Onboard Information System (OIS)*

L1 DISPATCH MESSAGES ASSOCIATED WITH ECAM ALERTS

Dispatch Message with ECAM Alert

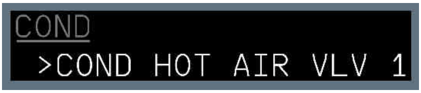
DISPATCH MESSAGES ASSOCIATED WITH ECAM CATEGORY

Dispatch Message with ECAM Category



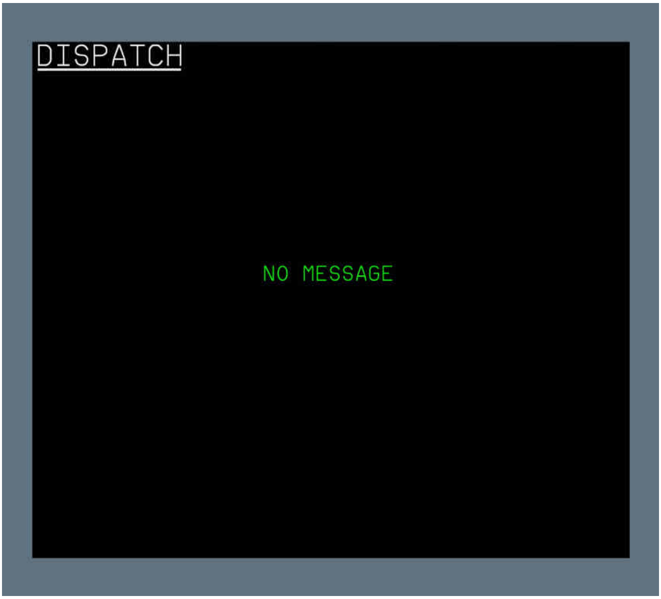
COND
\>COND HOT AIR VLV 1

The above dispatch message is not associated with an ECAM alert.
When the dispatch message is not associated with an ECAM alert, the ECAM triggers the DISPATCH PAGE UPDATE.
This ECAM alert only appears before takeoff and after all engine shutdown.
L2 For more information about the DISPATCH PAGE UPDATE, *Refer to procedure*

L1 NO MESSAGE PAGE

When the flight crew displays the DISPATCH page and no dispatch message is available, the NO MESSAGE label appears.

No Message Page



DISPATCH

NO MESSAGE

L2 When there is no message, the DISPATCH page remains 3 s then the SD page reverts to the previous SD page.

L1 TAKEOFF LINE INDICATOR

The TAKEOFF line separates the list of the dispatch messages:
- The dispatch messages that occurred before the flight crew applied the takeoff thrust on ground are displayed below the TAKEOFF line
- The dispatch messages that occurred after the flight crew applied the takeoff thrust on ground are displayed above the TAKEOFF line.

L2 The takeoff line appears when the flight crew sets the take off thrust and disappears 5 min after the last engine shutdown.

L1 OVERFLOW INDICATOR

When there are more than one page of dispatch messages:
- The DISPATCH page number appears next to the DISPATCH title
- The overflow indication appears below the dispatch messages on the DISPATCH pages.

Overflow Indicator

PRESS DISPCH FOR NEXT DISPATCH PAGE

When this message appears, the flight crew can press the DISPCH pb on the ECP to display the next DISPATCH page with the dispatch messages previously triggered .

L2 When the flight crew presses the DISPCH pb on the last dispatch page, the DISPATCH page disappears from the SD and the light of DISPCH pb goes off.

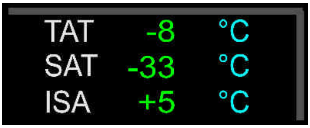
TEMPERATURE DATA

The left column displays the external air temperature values in degrees Celsius. The applicable plus and minus signs always appear.

L13



TAT -8 °C
SAT -33 °C
ISA +5 °C

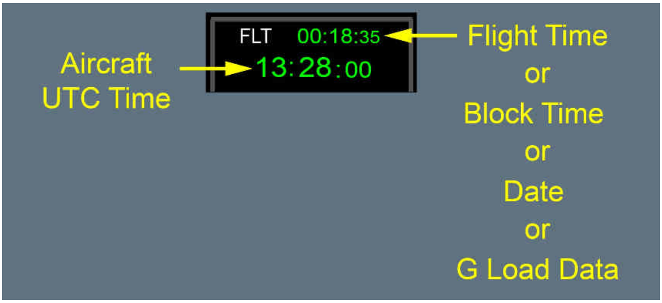
Indicates:
- The Total Air Temperature (TAT)
  The ADIRS provides the TAT and SAT values
- The Static Air Temperature (SAT)
  The ADIRS provides the TAT and SAT values
- The International Standard Atmosphere (ISA) deviation.
  The CDS uses SAT to compute the ISA deviation.

Ident.: DSC-31-CDS-60-10-80-10-00000045.0001001 / 24 APR 14

TIME AND G LOAD DATA

The first line of the middle column may display either the flight time, the block time, the date, or the G load data.
The Aircraft Universal Time Coordinated (UTC) time appears on the second line.

Time and G Load Data



FLIGHT TIME

The Flight (FLT) time appears, if the flight crew selects the FLT TIME display via the POSITION/TIME page of the MFD.

L2 For more information about the POSITION/TIME page, *Refer to DSC-22-FMS-20-20-20 POSITION/TIME Page*.

L3 The FMS provides the FLT time.

L1

Indicates the FLT time. The format is HH:MM:SS.

BLOCK TIME

The Block (BLK) time appears, if the flight crew selects the BLK TIME display via the POSITION/TIME page of the MFD.

L2 For more information about the POSITION/TIME page, *Refer to DSC-22-FMS-20-20-20 POSITION/TIME Page*.

L3 The FMS provides the BLK time.

L1

Indicates the BLK time. The format is HH:MM:SS.

DATE

The date appears, if the flight crew selects the DATE display via the POSITION/TIME page of the MFD.

L2 For more information about the POSITION/TIME page, *Refer to DSC-22-FMS-20-20-20 POSITION/TIME Page*.

L3 The ADIRS provides the date.

L1

Indicates the date. The format is DD MMM YYYY.

G LOAD DATA

If the measured G load exceeds a specific range, the first line of the middle column indicates the abnormal G load.

L2 The G LOAD indication appears, if the G load is less than 0.7 g, or more than 1.4 g, for more than 2 s.
Then, the G LOAD indication remains displayed as long as the G load is in the abnormal range.
The G LOAD indication disappears, 5 s after the G load returns in the normal range.

L1 The applicable plus or minus signs always appears.

L3 The ADIRS provides the G load data.

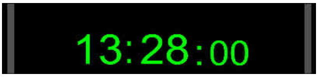
L1

Indicates the abnormal G load.

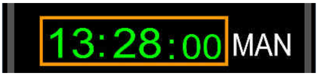
An abnormal G load value was measured, but the value is not available.

AIRCRAFT UTC TIME

L13



Indicates the UTC time, when the aircraft time reference is set to AUTO on the POSITION/TIME page of the MFD.
The format is HH:MM:SS.
The ADIRS provides the UTC time. For more information about the computation of the aircraft time reference, *Refer to DSC-34-NAV-20-10-70 Time Function*.



Indicates the manual time entry, when the aircraft time reference is set to MANUAL on the POSITION/TIME page of the MFD.
The flight crew can manually enter the UTC time in the UTC field of the POSITION/TIME page of the MFD.

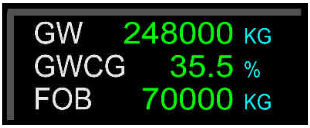
Ident.: DSC-31-CDS-60-10-80-10-00000046.0001001 / 09 MAR 16

WEIGHT AND FUEL DATA

The right column displays weight and fuel data: The aircraft Gross Weight (GW), the aircraft Gross Weight Center of Gravity (GWCG), and the Fuel On Board (FOB).

L3 In normal operation, the permanent data displays the GW, GWCG, and FOB values from the Fuel Quantity Management System (FQMS) computation.

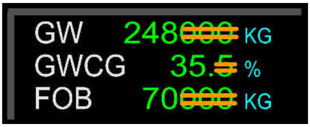
L1 The GW and FOB values are rounded off to the nearest hundred.



GW 248000 KG
GWCG 35.5 %
FOB 70000 KG

Indicates:
- The GW in kilograms (kg) or in pounds (lbs)
- The GWCG in per cent
- The FOB in kilograms (kg) or in pounds (lbs).

L123



GW 248~~000~~ KG
GWCG 35.~~5~~ %
FOB 70~~000~~ KG

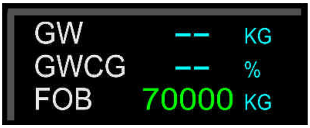
Value accuracy is degraded.

Associated with one of the following alerts:
- FUEL FQI FAULT
- FUEL FQMS 1(2)(1+2) FAULT

The GW value is dashed in the case of an FQMS failure, when:
- The CDS computes the GW based on last memorized FOB and ZFW values, with current total fuel used (engines+ APU).
- The WBBC computes the GW, if the CDS cannot compute the GW.

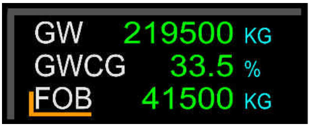
The GWCG value is dashed in the case of an FQMS failure, when the WBBC computes the GW.

The FOB value is dashed in the case of an FQMS failure, when the CDS computes the FOB with:
- The memorized FOB value at second engine start.
- The current value of total fuel used (engines+APU).



GW -- KG
GWCG -- %
FOB 70000 KG

The aircraft is on ground, and the flight crew did not enter the ZFW and ZFWCG in the FMS.



GW 219500 KG
GWCG 33.5 %
FOB 41500 KG

At least one fuel tank is not usable.

Ident.: DSC-31-CDS-60-10-80-10-00000018.0001001 / 24 APR 14

NOT VALID DATA

If the value of a parameter is not valid, XX appears, instead of the value.

Ident.: DSC-31-CDS-60-10-80-10-00018765.0001001 / 02 MAY 14

SD PAGE GRID

The permanent data area can also display the SD page grid, when the flight crew:

- Rotates the SD knob, on the ECAM control panel (ECP)
- Presses the ALL pb, on the ECP.

SD Page Grid

L2 The C/B 2 selection is available only if the C/B 2 page is not empty.

L1 When the SD page grid is displayed, the flight crew can move the selection box to select an SD display, via:

- The SD knob of the ECP
- The ALL pb of the ECP.

The SD page grid disappears, when:

- The flight crew selects an SD display
- The grid remains inactive for 5 s.

L2 The SD page grid is the only way to access to the C/B pages.

MASTER WARN pb

MASTER WARN

The ECAM triggers a warning: The MASTER WARN light flashes, and an audio indicator sounds.
The audio indicator associated with the MASTER WARN light is usually the continuous repetitive chime, but the audio indicator can also be a specific sound, a synthetic voice message, or a specific sound with a synthetic voice message.
When pressed, the light goes off, and the audio indicator associated with the warning stops.
However, for some specific warnings, the flight crew cannot turn off the light and stop the audio indicator by pressing the MASTER WARN pb (e.g overspeed).

L2

MASTER
WARN

or

MASTER
WARN

The ECAM triggers a warning, and one FWS is inoperative. As each FWS controls half of the MASTER WARN light, the remaining FWS turns on its assigned half of the MASTER WARN light.

MASTER CAUT pb

L13

MASTER
CAUT

The ECAM triggers a caution (level 2): The MASTER CAUT light comes on, and the single chime sounds.
The MASTER CAUT light remains steady.
When pressed, the light goes off, and the single chime associated with the caution stops.

L2

MASTER
CAUT

or

MASTER
CAUT

The ECAM triggers a caution, and one FWS is inoperative. As each FWS controls half of the MASTER CAUT light, the remaining FWS turns on its assigned half of the MASTER CAUT light.

AUDIO INDICATORS

Ident.: DSC-31-CDS-60-20-00000010.0001001 / 24 APR 14
Applicable to: ALL

Audio Indicator	Condition or Cause	Duration (1)
Continuous Repetitive Chime (Sound)	The ECAM triggers a new level 3 alert (Warning), and the Master warning comes on.	Sounds until the flight crew presses any MASTER WARN pb (except for some warnings that the flight crew cannot cancel via the MASTER WARN pb).
Single Chime (Sound)	The ECAM triggers a new level 2 alert (Caution), and the Master caution comes on.	Sounds one time.

(1) *All audio indicators are canceled if the flight crew presses the EMER CANC pb on the ECP.*

L2 For more information about the list of all audio indicators, *Refer to DSC-31-CDS-60-10-10 Audio Indicators*.

ECP

Applicable to: ALL

Ident.: DSC-31-CDS-60-20-10-00000048.0001001 / 24 APR 14

The flight crew uses the ECP to interface with the SD and the WD.

There is one ECP, and it is on the pedestal.

The flight crew uses the ECP to:
- Navigate in a menu or in a procedure
- Select an item in a menu
- Validate an item in a procedure
- Activate the takeoff configuration test
- Cancel alerts
- Clear alerts or abnormal procedures
- Access the SD pages (except the CRUISE page)
- Access the not-sensed abnormal and emergency procedures
- Access the deferred procedures
- Access the DISPATCH page
- Access the STATUS page and the STATUS MORE page
- Display videos of the aircraft cameras.

ALL pb

L13

When pressed and maintained, the SD displays the SD pages one after the other, and displays each SD page for 3 s.
In addition, the permanent data area displays the SD page grid.

The display cycle begins with:
- The currently-displayed SD page, or
- The ENG SD page, when the current SD display is not in the list of cycled displays.

The SD display appears in the sequence of the SD page grid.
The display cycle ends when the SD display revert to the first page of the cycle.
When released, the last-displayed SD page remains, until a new page is either requested by the flight crew, or displayed by the ECAM, and the SD page grid disappears from the permanent data area.
For more information about the SD page grid, *Refer to DSC-31-CDS-60-10-80 SD Page Grid*.

Ident.: DSC-31-CDS-60-20-10-00000051.0001001 / 24 APR 14

SD knob

The flight crew can select the SD display with the SD knob:
- When turned:
  - Displays the SD page grid on the permanent data area, if the permanent data area is not displayed.
  - Moves the selection box of the SD page grid in the direction of the knob rotation, when the SD page grid is already displayed on the permanent data area.
- When pressed, displays the SD page selected on the SD page grid, and removes the SD page grid.

L2 For more information about the SD page grid, *Refer to DSC-31-CDS-60-10-80 SD Page Grid*.

L1

The SD display is one of the following:
- The DISPATCH page
- The STATUS, or STATUS MORE page
- An automatic SD display, in accordance with the flight phase
- An SD display, in accordance with the active ECAM alert.

The SD display is:
- A flight crew selection, or
- An SD display due to an advisory.

Ident.: DSC-31-CDS-60-20-10-00000061.0001001 / 24 APR 14

Tick pb

When pressed:
- Validates or cancels the procedure item that is in the selection box on the WD
- Selects one item of a procedure menu, when the item is in the selection box on the WD.

Ident.: DSC-31-CDS-60-20-10-00000062.0001001 / 24 APR 14

WHEEL

Moves the selection box to scroll through a procedure or a procedure menu on the WD.

Ident.: DSC-31-CDS-60-20-10-00000052.0001001 / 24 APR 14

T.O CONFIG pb

When pressed, initiates a takeoff configuration test. This test simulates the application of takeoff power.
If all of the monitored systems are in the correct takeoff configuration, the WD displays the T.O CONFIG NORMAL line in the T.O memo section.
If the test is not successful, the applicable alerts are triggered.
For more information about the takeoff configuration test, *Refer to DSC-31-CDS-60-30 Takeoff Configuration Test*.

Ident.: DSC-31-CDS-60-20-10-00000053.0001001 / 24 APR 14

DEFRD pb

The WD does not display the DEFERRED PROCEDURES page.
When pressed, the DEFERRED PROCEDURES page appears on the WD.

The WD displays the DEFERRED PROCEDURES page.
When pressed, the DEFERRED PROCEDURES page disappears from the WD.

Ident.: DSC-31-CDS-60-20-10-00000054.0001001 / 24 APR 14

ABN pb

The WD does not display the ABNORMAL PROCEDURES menu.
When pressed, the ABNORMAL PROCEDURES menu appears on the WD.

The WD displays the ABNORMAL PROCEDURES menu.
When pressed, the ABNORMAL PROCEDURES menu disappears from the WD.

Ident.: DSC-31-CDS-60-20-10-00000055.0001001 / 06 MAR 15

EMER CANC pb

The EMER CANC pb is a guarded pushbutton.

L123

When pressed:

- Cancels the audio indicator and turns off the MASTER WARN light, associated with an ECAM warning. However, the associated procedure remains displayed on the WD.
  The audio indicator and the light on the attention-getter are not cancelled for the remainder of the flight. If the ECAM warning is triggered a second time, the audio indicator and the MASTER WARN light appear again.
- Cancels the single chime, the procedure on the WD, and turns off the MASTER CAUT light, that are associated with an ECAM caution
  The ECAM caution is cancelled for the remainder of the flight, even if the triggering conditions occur again.
  The title of the cancelled caution appears in the CANCELLED CAUTION section of the STATUS MORE page.
- Cancels all audio indicators and aural alerts
  If the triggering conditions occur again, the audio indicators and aural alerts sound again.
- Deactivates an activated not-sensed procedure.
  However, Airbus does not recommend to use the EMER CANC pb to deactivate a not-sensed procedure.

Note:
1. *Pressing the EMER CANC pb cancels only one alert at a time. Therefore, if the WD displays more than one alert, press the EMER CANC pb as many times as necessary to cancel each alert one at a time.*
2. *When alerts are cancelled with the EMER CANC pb but remain active, these alerts reappear on the WD after the flight crew presses the RCL ALL pb on the ECP for more than three seconds.*
3. *When pressed and if there is no alert, the WD displays the EMERGENCY CANCEL ON message.*

Ident.: DSC-31-CDS-60-20-10-00000056.0001001 / 03 JUL 20

1 RCL LAST pb

L12

When pressed, the WD displays the last alert that was previously cleared.
If the triggering conditions of the last cleared alert are no longer applicable, the recall has no effect.

Ident.: DSC-31-CDS-60-20-10-00000058.0001001 / 24 APR 14

DISPCH pb

The SD does not display the DISPATCH page.
When pressed, displays the DISPATCH page.

The SD displays the DISPATCH page.

When pressed:
- The DISPATCH page disappears, if there is no overflow.
- The next DISPATCH page appears, if there is an overflow.

Ident.: DSC-31-CDS-60-20-10-00000059.0001001 / 24 APR 14

STS pb

The SD does not display the STATUS page.
When pressed, the STATUS page appears on the SD.

The SD displays the STATUS page.
When pressed and if there is an overflow on the STATUS page, the next part of the STATUS page appears on the SD.
When pressed and if there is no overflow on the STATUS page, the STATUS page disappears from the SD.

Ident.: DSC-31-CDS-60-20-10-00000060.0001001 / 24 APR 14

MORE pb

The SD does not display the STATUS MORE page or a SD MORE page.

When pressed:
- If the SD displays the STATUS page, and the MORE reminder is at the bottom of page, the STATUS MORE page appears
- If the SD displays a system page with ...MORE indication below the title of the system page, the associated MORE page appears.

The SD displays the STATUS MORE page, or a SD MORE page.

When pressed:
- If the SD displays the STATUS MORE page, the STATUS MORE page disappears, and the SD reverts to the previous STATUS page.
- If the SD displays the MORE page of a system SD page, the MORE page disappears, and the SD reverts to the system SD page.

Ident.: DSC-31-CDS-60-20-10-00000057.0001001 / 06 MAR 15

RCL ALL pb

- When pressed, the WD displays all previously-cleared alerts that are still active.
- When pressed for more than three seconds, the WD displays all alerts that were previously:
  - Cancelled via the EMER CANC pb, or
  - Inhibited based on the current ECAM flight phase, or
  - Cleared.

Note: When pressed and if there is no alert to recall, the NORMAL message appears for 3 seconds on the WD.

Ident.: DSC-31-CDS-60-20-10-00000063.0001001 / 24 APR 14

CLEAR pb

When pressed, has no effect because there is no clear bar on the WD.

When pressed, clears the lines that are associated with the clear bar on the WD.

Note: The CLEAR pb does not cancel any audio indicator that is associated with a caution or warning, and does not deactivate a not-sensed procedure.

Ident.: DSC-31-CDS-60-20-10-00000064.0001001 / 24 APR 14

Intentionally left blank

CHECKLIST AUTOMATIC RESET

Ident.: DSC-31-CDS-60-30-00000310.0001001 / 24 APR 14
Applicable to: ALL

The ECAM automatically resets all of the checklists:
- At aircraft power-up, or
- At the end of the flight, if the aircraft remains powered.

L2 The ECAM automatically resets the checklists 30 min after the last engine shutdown.

L1 In addition, an automatic reset of the checklists occurs, in the following cases:
- If the flight crew manually resets a checklist, the ECAM resets all subsequent checklists
- In the case of a go-around, the ECAM resets the AFTER TAKEOFF checklist and subsequent checklists
- After a system failure that affects a checklist, the ECAM resets the applicable checklist.

AUTOMATIC DEACTIVATION OF ABNORMAL NOT-SENSED PROCEDURES

Ident.: DSC-31-CDS-60-30-00009709.0001001 / 24 APR 14
Applicable to: ALL

The ECAM automatically deactivates all the abnormal not-sensed procedures that are active:
- At aircraft power-up, or
- At the end of the flight, if the aircraft remains powered.

L2 The ECAM automatically deactivates the abnormal not-sensed procedures that are active 30 min after the last engine shutdown.

AUTOMATIC SD PAGE DISPLAY

Ident.: DSC-31-CDS-60-30-00000070.0001001 / 06 MAR 15
Applicable to: ALL

IN NORMAL AIRCRAFT OPERATION

In normal aircraft operation, the SD automatically displays some of the SD pages that are relevant for the flight crew, depending on the flight phase.

L2

SD Page	Automatic Display Conditions
DOOR	On ground: - Before engine start, or - After last engine shutdown.
APU	When the APU MASTER SW pb-sw is set to ON, until the end of the APU start sequence.

Continued on the following page

Continued from the previous page

SD Page	Automatic Display Conditions
ENG	- When the ENG START selector is set to IGN START, until the end of the engine start sequence, or - When the ENG START selector is set to CRANK, until the end of the engine crank sequence, or - When takeoff thrust is set, until 1 500 ft AGL or thrust reduction (depending on which one occurs first).
WHEEL	- After engine start, until takeoff thrust is set, or - After landing gear extension, until last engine shutdown.
F/CTL	After engine start, during flight control checks.
CRUISE	At 1 500 ft AGL or at thrust reduction (depending on which one occurs first), until landing gear extension in approach.
VIDEO	Above 1 500 ft AGL and until 800 ft, if video is required (e.g. cockpit door access request)

L1 The SD can also automatically display a system page in the case of a system advisory, when a parameter starts to deviate.

L2 For more information about advisory, *Refer to DSC-31-CDS-60-10-10 Advisory*.

L1 IN ABNORMAL AIRCRAFT OPERATION

When the ECAM triggers an alert, the SD displays the associated system display to identify the consequences of the alert.
Depending on the alert, one, none or several SD pages can be displayed.
When the flight crew clears the current active alert, the SD removes the associated SD page and displays the SD page that is associated with the next alert, if any.

L2 If several alerts are triggered at the same time, the flight crew can scroll the selection box of the WD on an alert that is displayed below the current active alert. The SD always displays the SD page that is associated with the alert where the WD selection box is.

L1 PRIORITY OF DISPLAY

In the case of simultaneous automatic requests for the display of SD pages, the following priority applies to change the current SD page display (from the highest priority to the lowest priority):

- SD page that automatically appears, when an alert is triggered
- SD page that automatically appears, in the case of an advisory
- SD page that automatically appears, depending on the flight phase.

L3 In accordance with above rules, when several SD pages can be automatically displayed at the same time by the same automatic trigger, the SD pages appear with the following priority.

Priority	SD Page
1	ENG SD page
2	APU SD page
3	F/CTL SD page
4	DOOR SD page
5	WHEEL SD page
6	VIDEO page
7	CRUISE page

L1 *Note:*
- *At any time the flight crew can manually display an SD page via the ECP. In this case the manual display has always priority over the automatic display.*
- *If the current SD page displayed is a manual display, then only an alert can change the current display.*

AUTOMATIC STATUS PAGE DISPLAY

Ident.: DSC-31-CDS-60-30-00019753.0001001 / 24 APR 14
Applicable to: ALL

L2 The STATUS page automatically appears, if all the following conditions are applicable:
- The STATUS page is not empty
- The aircraft is below 20 000 ft
- The aircraft is in cruise or descent
- The flight crew performs one of the following action:
  - Slat or flap extension
  - Barometric reference change from STD to barometric on the EFIS CP

TAKEOFF CONFIGURATION TEST

Ident.: DSC-31-CDS-60-30-00000071.0003001 / 03 JAN 19
Applicable to: ALL

At any time between engine start and takeoff, when the aircraft is ready for takeoff, the flight crew can request a takeoff configuration test.
In accordance with the SOPs, the flight crew performs this test before takeoff. For more information, *Refer to PRO-NOR-SOP-100 Taxi - Final Check*.
The T.O CONFIG ...TEST line of the T.O memo is a reminder that the flight crew must perform this test.
The flight crew presses the T.O CONFIG pb on the ECP to initiate the takeoff configuration test. This test simulates the application of takeoff power.
The test is successful, if all of the monitored systems are in the takeoff configuration.
When the takeoff configuration test is completed and successful, the T.O CONFIG NORMAL line appears in the T.O memo, instead of the T.O CONFIG ...TEST line.
If the test is not successful one or more alerts appears.

L2 Depending on the affected systems one or more of the following alerts appears:

- CONFIG PITCH TRIM NOT IN T.O RANGE, *Refer to (procedure)*.
- CONFIG RUDDER TRIM NOT IN T.O RANGE, *Refer to (procedure)*.
- CONFIG SLATS(FLAPS) NOT IN T.O CONFIG, *Refer to (procedure)*.
- CONFIG SPEED BRAKES NOT RETRACTED, *Refer to (procedure)*.
- CONFIG L(R) SIDESTICK FAULT (BY TAKEOVER), *Refer to (procedure)*.
- CONFIG AFT(FWD) CARGO DOOR NOT CLOSED, *Refer to (procedure)*.
- HYD G+Y SYS PRESS LO, *Refer to (procedure)*.
- BRAKES HOT, *Refer to (procedure)*.
- CAB PRESS MAN CTL FAULT, *Refer to (procedure)*.
- DOOR AFT(BULK)(FWD) CARGO POS DET FAULT, *Refer to (procedure)*.
- DOOR ALL POS DET FAULT, *Refer to (procedure)*.
- DOOR AVNCS NOT CLOSED, *Refer to (procedure)*.
- DOOR AVNCS POS DET FAULT, *Refer to (procedure)*.
- DOOR BULK CARGO NOT CLOSED, *Refer to (procedure)*.
- DOOR ESCAPE HATCH NOT CLOSED, *Refer to (procedure)*.
- DOOR ESCAPE HATCH POS DET FAULT, *Refer to (procedure)*.
- DOOR 1(2)(3)(4) L(R) NOT CLOSED, *Refer to (procedure)*.
- DOOR 1(2)(3)(4) L(R) POS DET FAULT, *Refer to (procedure)*.
- DOOR 1(2)(3)(4) L(R) SLIDE FAULT, *Refer to (procedure)*.
- DOOR MULTIPLE POS DET FAULT, *Refer to (procedure)*.
- ELEC DRIVE 1A(1B)(2B)(2A) DISCONNECTED, *Refer to (procedure)*.
- ELEC GEN 1A(1B)(2B)(2A) FAULT, *Refer to (procedure)*.
- ELEC GEN 1A(1B)(2B)(2A) OFF, *Refer to (procedure)*.
- ENG 1(2) OIL TEMP LO, *Refer to (procedure)*.
- F/CTL PITCH TRIM/FMS/CG DISAGREE, *Refer to (procedure)*.
- F/CTL T.O FLAPS/FMS DISAGREE, *Refer to (procedure)*.
- FUEL CTR TK L+R PMPS FAULT, *Refer to (procedure)*.
- FUEL L(R) TK MAIN+STBY PMPS FAULT, *Refer to (procedure)*.
- HYD G(Y) SYS PRESS LO, *Refer to (procedure)*.
- T.O RWY TOO SHORT, *Refer to (procedure)*.
- T.O SPEEDS NOT INSERTED, *Refer to (procedure)*.
- T.O SPEEDS TOO LOW, *Refer to (procedure)*.
- T.O V1/VR/V2 DISAGREE, *Refer to (procedure)*.

When corrective actions are completed, the flight crew must press the T.O CONFIG pb again to verify the takeoff configuration is correct.

L1 When the flight crew sets the takeoff power, the test automatically occurs again.

FWS REDUNDANCY

Ident.: DSC-31-CDS-60-40-00015029.0001001 / 24 APR 14
Applicable to: ALL

The two FWS operate independently and in parallel. Therefore, if one FWS fails, the remaining FWS is sufficient to perform all ECAM functions.

L2 The failure of one FWS is associated with the FWS FWS 1(2) FAULT (*Refer to procedure*) ECAM alert.

L1 However, the FWS controls some indicators that are divided in two parts, with each part associated with a FWS.

Therefore, in the case of a FWS failure, only half of the following indicators are available:
- The Master Caution indicator
- The Master Warning indicator
- The AUTOLAND indicator
- The ATC MSG indicator.

MASTER WARN AND MASTER CAUT INDICATORS

When a FWS fails the MASTER WARN and the MASTER CAUT indicators remain available, on both sides. Nevertheless, only the half part of each indicator remains available, depending on the FWS 1(2) failure.

HOW TO CHANGE COMPANY ECAM DATABASE

Ident.: DSC-31-CDS-60-50-00018783.0001001 / 02 OCT 14
Applicable to: ALL

The flight crew can change the ECAM database of the FWS via the COMPANY ECAM DATABASE MANAGEMENT page, when the aircraft is on ground.

L2 The COMPANY ECAM DATABASE is also referred to as Operator-Customized ECAM DATABASE (OCED). For more information about OCED, *Refer to DSC-31-CDS-60-10-20 FWS*.

MFD

Applicable to: ALL

Ident.: DSC-31-CDS-70-10-10-00001325.0001001 / 17 APR 14

There are two Multifunction Displays (MFDs), one for the Captain and one for the First Officer.

The MFD displays:
- The FMS pages (FMS)
- The ATC communication pages (ATC COM)
- The surveillance pages (SURV)
- The checklists page (C/L MENU)
- The FCU backup pages (FCU BKUP).

The MFD is interactive. Therefore, the flight crew can navigate through the pages and display, enter, or modify data via the KCCUs.

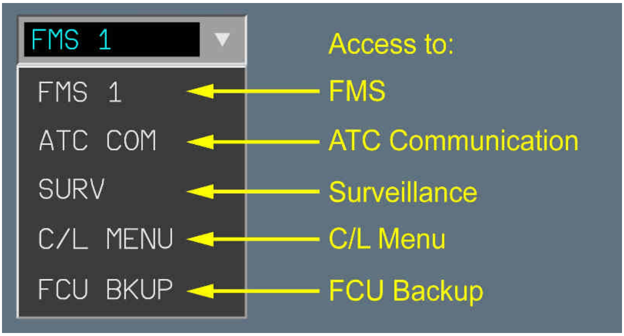
MFD SYSTEM MENU

Indicates the system identifier that displays data on the MFD.
The menu list displays all systems that can display data on the MFD.
When the flight crew clicks on an option of the menu, the associated page appears in the system page area.

MFD System Menu



L2 *Note:* *The identifier that enables to access the FMS page is different on the Captain's side and First Officer's side, and depends on which FMC provides data for display on the MFD.*

Ident.: DSC-31-CDS-70-10-10-00001331.0001001 / 15 APR 14

SHARED MESSAGE AREA

The shared message area displays messages in order to inform the flight crew about an event that is related to the FMS or ATC communication.
The shared message area displays the following messages:

D-ATIS RECEIVED	Indicates that a new ATIS report is received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.
D-ATIS GROUND MSG	Indicates that an ATIS FSM message is received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.
D-ATIS NO REPLY	Appears when the time-out (7.5 min) is reached and that no ATIS was received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.

D-ATIS SEND FAIL	Appears when an ATIS request failed for one of the following reasons: - The sending of the ATIS request failed, or - The time-out (6 min) for acknowledgement is reached, or - A negative answer for the ATIS request is received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.
CHECK FMS MESSAGE	Indicates that the FMS triggered an amber FMS message. Only appears if the MFD displays a page that is not an FMS page. Disappears when the flight crew accesses an FMS page.

L12

IND	Indicates that both FMS operate in INDEPENDENT mode. For information about the INDEPENDENT mode, *Refer to DSC-22-FMS-40 INDEPENDENT Mode*.

L2 *Note: The shared message area displays only one message at a time. However, the IND message can appear in addition to another message.*

Ident.: DSC-31-CDS-70-10-10-00001333.0001001 / 15 APR 14

FLIGHT NUMBER

Indicates the flight number that the flight crew entered on the FMS ACTIVE/INIT page (*Refer to DSC-22-FMS-20-20-20 INIT Page*).

Ident.: DSC-31-CDS-70-10-10-00001334.0001001 / 17 APR 14

PREVIOUS ITEM

The NOTE PAD enables the flight crew to write and store notes during the flight.
One independent NOTE PAD is available on each side of the cockpit.
The NOTE PAD appears on the lower part of the MFD.

L2 When the OIS is displayed on the center lower DU, and two MFDs are displayed on the CAPT(F/O) outer DU, the NOTE PAD is displayed on the inner MFD.

L3 When the NOTE PAD is full, the last entry removes the oldest entry.

L2 If the flight crew does not use the NOTE PAD, the NOTE PAD automatically closes after:
- 10 min on ground
- 1 min in flight.

Intentionally left blank

HOW TO OPEN THE NOTE PAD

Ident.: DSC-31-CDS-70-20-00011306.0001001 / 15 APR 14
Applicable to: ALL

To open the NOTE PAD, the flight crew has to:

- Press the NOTE PAD key on the KCCU, or
  In this case the last note is displayed on the NOTE PAD.
- Click on the NOTE PAD area, or
  In this case a pop-up list of notes appears.
- Press the ENT key when the cursor is over the NOTE PAD area.
  In this case the pop-up list of notes appears.

OIS

Ident.: DSC-31-CDS-80-00000081.0001001 / 18 APR 14
Applicable to: ALL

The Onboard Information System (OIS) provides software applications to the flight crew, the cabin crew, and the maintenance personnel.

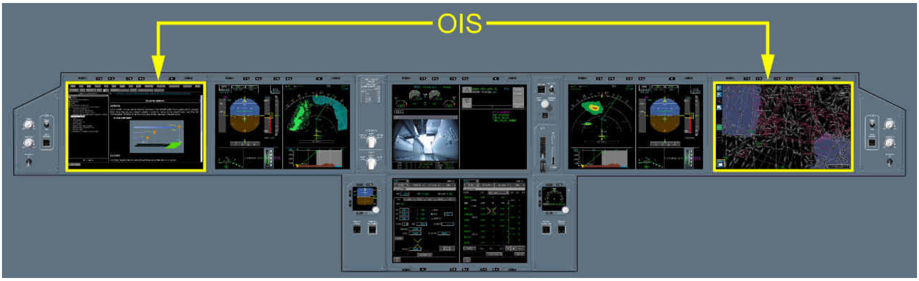
The flight crew uses the OIS applications to access the following tools and information:
- The aircraft operating manuals (OPS LIBRARY)
- The aircraft performance applications (T.O PERF, LDG PERF, IN-FLT PERF, LOADSHEET)
- The navigation charts (CHARTS)
- The mission management information (FLT FOLDER)
- The company communication application (COMPANY COM).

Note: Operators can install other applications.

L2 For more information, *Refer to DSC-46-OIS-10-10 Overview*.

L1 The CDS displays the OIS information. In the standard display configuration, the OIS dedicated screens are the CAPT and the F/O outer DUs.

OIS Overview



If necessary, the flight crew can display either the CAPT or F/O OIS on the center lower DU via the CAPT(F/O) OIS ON CENTER pb.

L2 For more information, *Refer to DSC-31-CDS-30-30 Normal Operations*.

Intentionally left blank

MAILBOX

Ident.: DSC-31-CDS-90-10-00000188.0001001 / 18 APR 14

GENERAL

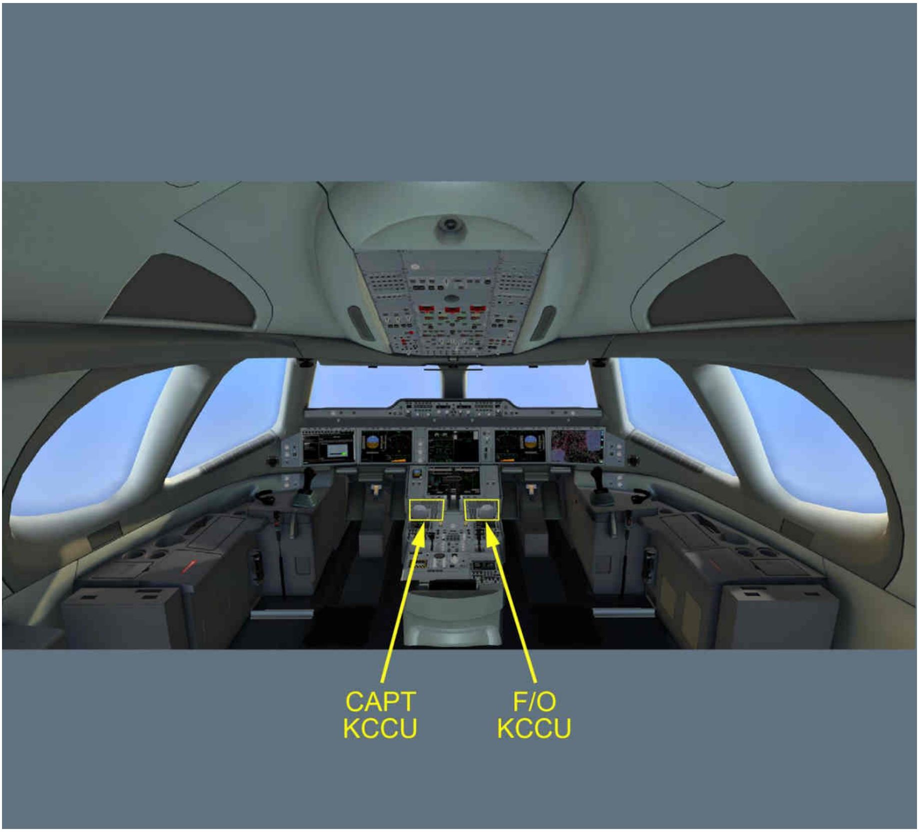
Ident.: DSC-31-CDS-100-10-00001083.0001001 / 24 APR 14
Applicable to: ALL

There are two Keyboard and Cursor Control Units (KCCUs) on the center pedestal. There is one for the Captain and one for the First Officer.

The KCCUs are used to:
- Interface with the NDs, the MFDs, the mailbox, and the OIS
- Select and/or modify parameters.

L3 Both KCCUs are functionally identical.

Cockpit Presentation



L1 Each KCCU has:
- A Keyboard (KBD) that enables to enter alphanumeric information
  The KBD also has shortcut keys that provide direct access to specific pages on a display unit.
- A Cursor Control Device (CCD) that enables to control the associated cursor.

L2 The KBD and the CCD are independent of each other: The failure of one does not affect the other.

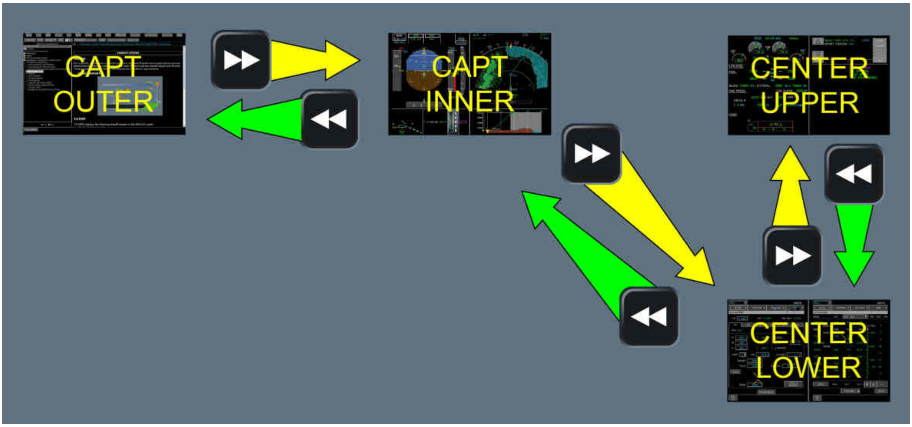
Note: *The KCCU continues to interact with the ND, MFD, mailbox, and OIS, regardless of the display unit reconfiguration.*

The flight crew uses the navigation keys to move the cursor from a display unit to another.
The illustration below shows the moving path of the Captain's cursor:

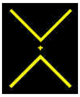


The moving path of the First Officer's cursor is symmetrically identical.

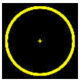
CURSOR DISPLAY

Each KCCU displays a different cursor.

The Captain's cursor is :



The First Officer's cursor is :



Both cursors can appear on the MFD or on the mailbox at the same time. However, only one KCCU can interact at one time. The active KCCU is the one that last interacted with the display. However, the cursor may disappear when the KCCU is not used for an extended period of time. It reappears, when the flight crew uses any key or the trackball of the KCCU.

INTERACTIVE ZONES

The flight crew can use the KCCU to interact with the objects on the different display units. When the cursor is moved over an interactive element of the display unit, a light blue box appears around this element.

INTERACTION WITH THE ND

The lateral navigation part and the airport navigation display are the only interactive parts of the ND.

The interactive objects are:
- The aircraft symbol
- All displayed waypoints

- All displayed navaids
- All displayed airports.

The KCCU can be used to perform the following functions:
- Direct To
- Insert or delete a waypoint
- Access data on any displayed airport
- Insert, erase, or undo the temporary flight plan.

For the Direct To and the Insert functions, an interactive FMS dialog box replaces the vertical display part of the ND. This FMS dialog box enables the flight crew to enter parameters with the KCCU.
For more information, *Refer to DSC-31-CDS-40-40-100 Interactive ND Overview*.

INTERACTION WITH THE OIS

The flight crew can use the KCCU to interact with the OIS applications.
When the flight crew moves the cursor of a KCCU to the OIS, yellow corners appear on the OIS.

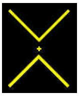
CURSOR

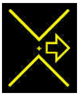
Ident.: DSC-31-CDS-100-20-00001094.0001001 / 07 MAY 18
Applicable to: ALL

Each KCCU has a unique cursor. The symbol changes to indicate the status of the cursor.

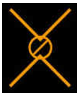
CAPTAIN'S CURSOR



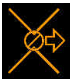
The Captain's cursor is active.



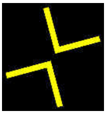
On the center lower DU, the Captain's cursor is active on the CAPT MFD at the separation with the F/O MFD.
When in this state, the Captain can move the cursor to the right to move the cursor to the F/O MFD.



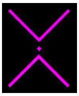
The Captain's cursor is not active.
This occurs when both Captain's and First Officer's cursors appear on the same display, and the First Officer's cursor is active.
Both cursors can be displayed on the center lower DU or on the mailbox.



On the center lower DU, the Captain's cursor is not active on the CAPT MFD at the separation with the F/O MFD.
When in this state, the Captain can move the cursor to the right to move the cursor to the F/O MFD.

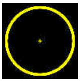


Appears:
- Before the cursor is displayed: The symbol rotates and becomes increasingly smaller, until it disappears. Then, the cursor becomes active.
- When the Captain selects a different page on the MFD, or moves the cursor to a different display unit.

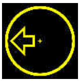


: The Captain's cursor is magenta on the ND when the ANF is displayed.

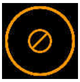
FIRST OFFICER'S CURSOR



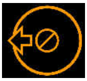
The First Officer's cursor is active.



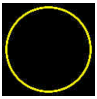
On the center lower DU, the First Officer's cursor is active on the F/O MFD at the separation with the CAPT MFD.
When in this state, the First Officer can move the cursor to the left to move the cursor to the CAPT MFD.



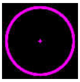
The First Officer's cursor is not active.
This occurs when both Captain's and First Officer's cursors appear on the same display, and the Captain's cursor is active.
Both cursors can be displayed on the center lower DU or on the mailbox.



On the center lower DU, the First Officer's cursor is not active on the F/O MFD at the separation with the CAPT MFD.
When in this state, the First Officer can move the cursor to the left to move the cursor to the CAPT MFD.



Appears:
- Before the cursor is displayed: The circle becomes increasingly smaller, until it disappears. Then, the cursor is active.
- When the First Officer selects a different page on the MFD, or moves the cursor to a different display unit.



: The First Officer's cursor is magenta on the ND when the ANF is displayed.

CURSOR CONTROL DEVICE

Applicable to: ALL

Ident.: DSC-31-CDS-100-20-20-00001097.0001001 / 13 JAN 15

Cursor Control Device

Trackball
Validation pb
Wheel
CCD 1
KBD
ESC
ESC key
KBD key

The two buttons on the bottom-left and bottom-right of the trackball are inactive.
The spare keys without label are inactive.

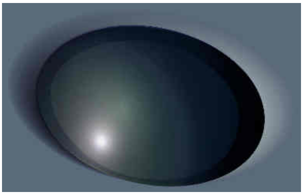
Ident.: DSC-31-CDS-100-20-20-00001126.0001001 / 24 APR 14

WHEEL

Enables the flight crew:
- To change the selection in an option-list
- To scroll through a page (e.g. F-PLN page or message list)
- To increment a value in an entry field.

Ident.: DSC-31-CDS-100-20-20-00001128.0001001 / 24 APR 14

TRACKBALL



Enables the flight crew to move the cursor over the interactive section of the selected display unit.
Operates the same way as the direction arrow keys on the KBD.

Ident.: DSC-31-CDS-100-20-20-00001131.0001001 / 24 APR 14

VALIDATION PB

Operates the same way as the ENT key of the KBD.

Enables the flight crew to:
- Edit an entry field:
  - The cursor is positioned in the field, and is ready for a new entry
  - When data is entered, another click validates the entry, and the cursor moves to the field or button that is most likely to be used next
- Edit an option-list:
  - The option-list opens to the first option that is selected
  - The flight crew uses the wheel or the direction arrow keys, to change the selected option, if required
  - Another click validates the selection, and the cursor moves to the field or button that is most likely to be used next
- Activates an button.

Ident.: DSC-31-CDS-100-20-20-00001133.0001001 / 24 APR 14

NAVIGATION KEYS

Moves the cursor to the next display unit with an interactive format that is to the right, or to the left, of the one that is currently selected.

Ident.: DSC-31-CDS-100-20-20-00001134.0001001 / 24 APR 14

ESC KEY

L12

When pressed:
- Cancels the current field edition, or
  The field returns to the last valid value.
- Closes a pop-up window or a menu.

There is a similar key on the KBD.

Ident.: DSC-31-CDS-100-20-20-00001136.0001001 / 04 SEP 17

KBD KEY

L12

When pressed, displays the soft keyboard on the MFD depending on the type of editable field and the availability of the KCCU keyboard.
By default, the soft keyboard appears in the lower part of the MFD, unless the field to be edited is in the lower part of the MFD.
The flight crew can use the soft keyboard when the KCCU keyboard is inoperative, for more information, *Refer to DSC-31-CDS-100-30 Soft Keyboard Display*.

The flight crew can also access to the soft keyboard when the KCCU keyboard is operative:
- To edit an entry field, the flight crew selects an entry field then presses the KBD key in order to display the soft keyboard
- To manually enter data in a list, the flight crew performs the following sequence:
  - Select the list
  - Press one time the KBD key to activate the cursor in the list
  - Press a second time the KBD key to display the soft keyboard.

When pressed again, the soft keyboard disappears from the MFD.

When pressed:
- Displays the FMS DIRECT TO page on the MFD (*Refer to DSC-22-FMS-20-20-20 DIRECT TO Page*)
- Moves the cursor back to the MFD, if the cursor was previously on another display.

Ident.: DSC-31-CDS-100-20-10-00001100.0001001 / 24 APR 14

PERF KEY

When pressed:
- Displays the FMS ACTIVE/PERF page (on the panel that corresponds to the active flight phase) on the MFD (*Refer to DSC-22-FMS-20-20-20 PERF Page*)
- Moves the cursor back to the MFD, if the cursor was previously on another display.

Ident.: DSC-31-CDS-100-20-10-00001102.0001001 / 24 APR 14

INIT KEY

When pressed:
- Displays the FMS ACTIVE/INIT page on the MFD (*Refer to DSC-22-FMS-20-20-20 INIT Page*)
- Moves the cursor back to the MFD, if the cursor was previously on another display.

Ident.: DSC-31-CDS-100-20-10-00001103.0001001 / 24 APR 14

NAV AID KEY

When pressed:
- Displays the FMS POSITION/NAVAIDS page on the MFD (*Refer to DSC-22-FMS-20-20-20 POSITION/NAVAIDS Page*)
- Moves the cursor back to the MFD, if the cursor was previously on another display.

Ident.: DSC-31-CDS-100-20-10-00011278.0001001 / 24 APR 14

C/L MENU KEY

When pressed:
- Displays the CHECKLISTS page on the MFD (*Refer to DSC-31-CDS-60-10-30 CHECKLIST MENU Page*)
- Moves the cursor back to the MFD, if the cursor was previously on another display.

Ident.: DSC-31-CDS-100-20-10-00001104.0001001 / 24 APR 14

F-PLN KEY

When pressed:

- Displays the top of the flight plan on the FMS ACTIVE/F-PLN page on the MFD (*Refer to DSC-22-FMS-20-20-20 F-PLN Page*)
- Moves the cursor back to the MFD, if the cursor was previously on another display.

Ident.: DSC-31-CDS-100-20-10-00001105.0001001 / 24 APR 14

DEST KEY

When pressed:

- Displays the bottom of the destination flight plan on the FMS ACTIVE/F-PLN page on the MFD (*Refer to DSC-22-FMS-20-20-20 F-PLN Page*)
- Moves the cursor back to the MFD, if the cursor was previously on another display.

Ident.: DSC-31-CDS-100-20-10-00001107.0001001 / 24 APR 14

SEC INDEX KEY

When pressed:

- Displays the FMS SEC INDEX page on the MFD (*Refer to DSC-22-FMS-20-20-20 SEC INDEX Page*)
- Moves the cursor back to the MFD, if the cursor was previously on another display.

Ident.: DSC-31-CDS-100-20-10-00001109.0001001 / 24 APR 14

SURV KEY

When pressed:

- Displays the SURV CONTROLS page on the MFD (*Refer to DSC-34-SURV-70-50 CONTROLS Page*)
- The cursor moves back to the MFD, if the cursor was previously on another display.

Ident.: DSC-31-CDS-100-20-10-00001111.0001001 / 24 APR 14

ATC COM KEY

When pressed:

- Displays the ATC COM REQUEST page on the MFD (*Refer to DSC-46-ATC-20-30-30 REQUEST Page*)
- Moves the cursor back to the MFD, if the cursor was on another display before.

Ident.: DSC-31-CDS-100-20-10-00011279.0001001 / 24 APR 14

OIS KEY

When pressed, moves the cursor to the onside OIS display.
If the OIS is not displayed, the OIS appears.

Ident.: DSC-31-CDS-100-20-10-00001112.0001001 / 24 APR 14

ND KEY

When pressed, moves the cursor to the onside ND.
If the ND is not displayed, the ND appears.

Ident.: DSC-31-CDS-100-20-10-00011280.0001001 / 24 APR 14

MFD KEY

When pressed, the cursor moves to the onside MFD.
If the MFD is not displayed, the MFD appears.

Ident.: DSC-31-CDS-100-20-10-00001110.0001001 / 24 APR 14

MAIL BOX KEY

When pressed, moves the cursor to the mailbox (*Refer to DSC-46-ATC-20-60 Mailbox*).

Ident.: DSC-31-CDS-100-20-10-00001116.0001001 / 24 APR 14

← KEY

- Clears the character that is on the left of the cursor, when the flight crew presses the key less than 2 s, or

Example of Character Clear

ABCDE

- Clears the entire entry field when:
  - The flight crew presses the key more than 2 s, or
  - The entire field is selected.

Example of Selection Clear

ABCDIEK

Note: *In some entry fields (e.g. navaids) clearing a previously entered value will set the entry field to the default value.*

Ident.: DSC-31-CDS-100-20-10-00011282.0001001 / 24 APR 14

NOTE PAD KEY

- When pressed less than 2 s, activates the NOTE PAD area on the MFD, in edit mode.
- When pressed more than 2 s, closes the NOTE PAD area on the MFD.

For more information about the NOTE PAD, *Refer to DSC-31-CDS-70-10 NOTE PAD*.

Ident.: DSC-31-CDS-100-20-10-00001114.0001001 / 24 APR 14

ENT KEY

Operates the same way as the validation pb of the CCD.

- Edits an entry field:
  - The cursor is positioned in the field, and is ready for a new entry
  - When data is entered, another click validates the entry, and the cursor moves to the field or button that is most likely to be used next
- Edits an option-list:
  - The option-list opens, and the first option is selected
  - The flight crew uses the wheel or the direction arrow keys, to change the selected option, if required
  - Another click validates the selection, and the cursor moves to the field or button that is most likely to be used next
- Activates a button.

Ident.: DSC-31-CDS-100-20-10-00001117.0001001 / 24 APR 14

NUMERIC KEYS

Note: Only one character is displayed, even if the flight crew presses and holds a numeric key.

NUMBER KEYS

Inserts a number at the cursor position in the entry field.

+/- KEY

Inserts:

- A "-" (minus) sign in front of the edited value, when pressed for the first time
- A "+" (plus) sign in front of the edited value, when pressed again.

. KEY

Inserts a “.” (decimal point) at the cursor position in the entry field.

SPACE KEY

Inserts a space at the cursor position in the entry field.

Ident.: DSC-31-CDS-100-20-10-00001118.0001001 / 24 APR 14

ALPHABET KEYS

Note: *Only one character is displayed, even if the flight crew presses and holds an alphabet key.*

LETTER KEYS

Inserts an alphabet character at the cursor position in the entry field.
The alphabet keys are organized in the “QWERTY” (US keyboard) layout.

N, E, S, W (CARDINAL POINT) KEYS

Inserts a cardinal point (N, E, S, W) in fields, when applicable.
There is a dot under these letters to help the flight crew to easily find these keys.

/ KEY

Inserts a “/” (slash) at the cursor position in the entry field.

SPACE KEY

Inserts a space at the cursor position in the entry field.

Ident.: DSC-31-CDS-100-20-10-00001121.0001001 / 24 APR 14

CLR INFO KEY

When pressed, clears the message that is currently displayed in the FMS, ATC COM, or SURV message area.

Ident.: DSC-31-CDS-100-20-10-00001123.0001001 / 24 APR 14

ESC KEY

L12

When pressed:
- Cancels the current field edition, or
  The field returns to the last valid value.
- Closes a pop-up window or a menu.

There is a similar key on the CCD.

Ident.: DSC-31-CDS-100-20-10-00001125.0001001 / 24 APR 14

DIRECTION ARROW KEYS

- Move the cursor from one interactive area to another, in the direction of the pressed key. The cursor remains in the selected display unit
  These keys operate in the same way as the trackball on the CCD.
- Move the light blue selection box in the option-list, in the direction of the pressed key. These keys operate in the same way as the wheel on the CCD.

Note: *If the flight crew presses and holds a direction arrow key, the associated action is repeated periodically.*

LOSS OF KEYBOARD

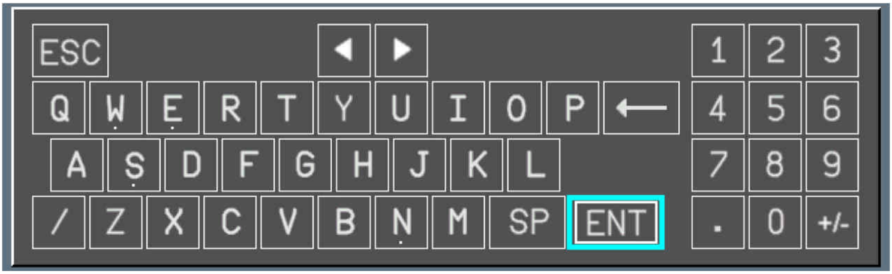
Applicable to: ALL

Ident.: DSC-31-CDS-100-30-10-00001138.0001001 / 24 APR 14

KEYBOARD BACKUP

In the case of a total or partial loss of the KBD, the flight crew can use a soft keyboard as a backup.

Soft Keyboard



The soft keyboard has:
- Alphabet softkeys
  “A” to “Z” keys, organized in a “QWERTY” layout.
- Numeric softkeys
  “0” to “9”, “.” (decimal point) and "+/-” (plus or minus) keys.
- A backspace softkey
- An ENT softkey
- A “/” (slash) softkey
- A space (SP) softkey
- An escape (ESC) softkey
- N, E, S, W softkeys
  These softkeys insert cardinal points. There is a dot under these letters to help the flight crew to easily find these keys.
- Left and right arrow softkeys.
  These softkeys operate in the same way as the left and right keys of the direction arrow keys.

Ident.: DSC-31-CDS-100-30-10-00001141.0001001 / 04 SEP 17

SOFT KEYBOARD DISPLAY

The soft keyboard is a backup of the KCCU keyboard.
By default, the soft keyboard appears in the lower part of the MFD, unless the field to be edited is in the lower part of the MFD.

When the KCCU keyboard is inoperative:
- To edit an entry field, the flight crew clicks on the entry field in order to display the soft keyboard
- To manually enter data in a list, the flight crew performs the following sequence:
  - Select the list
  - Press one time the KBD key to display the soft keyboard.

Note: *The soft keyboard cannot be used to edit an entry field on the ND, even if the flight crew can continue to interact with the ND, via the CCD.*
Therefore, if the KCCU keyboard fails, it is not recommended to access the FMS functions via the ND, but to use the MFD instead.

Ident.: DSC-31-CDS-100-30-10-00001142.0001001 / 24 APR 14

SOFT KEYBOARD EXIT

The soft keyboard is no longer displayed on the MFD:
- When the flight crew presses the ENT key or the ESC key
- When the flight crew presses the KBD key on the CCD, while the soft keyboard is displayed

L3 Note: *Pressing the KBD key to remove the soft keyboard from the MFD will leave the cursor in its current position.*

L1
- In the case of a display unit reconfiguration that involves the MFD.

Ident.: DSC-31-CDS-100-30-10-00001144.0001001 / 24 APR 14

USE OF THE SOFT KEYBOARD

When the soft keyboard appears, a light blue box highlights the “ENT” softkey.
The light blue box highlights the currently selected softkey. The flight crew can change the selection with the trackball of the CCD.
Only one softkey is highlighted at a time.
When the flight crew presses the CCD validation pb, the selected character is entered in the active entry field.

LOSS OF KCCU

Ident.: DSC-31-CDS-100-30-00024499.0001001 / 02 NOV 17
Applicable to: ALL

In the case of loss of a KCCU, the ECAM displays the CDS CAPT(F/O) KCCU CURSOR CTL + KEYBOARD FAULT alert (*Refer to procedure*).

L2 On the affected side:
- The KCCU is not available to interact with the MFD session
- The OIS KBD remains available to interact with the OIS session.

L1 On the affected side, the CAPT(F/O) OIS ON CENTER pb becomes inactive.

L2 The associated INOP light does not come on.

L1 If the OIS session of the affected side is displayed on the center lower display unit, the flight crew can press two times the OIS ON CENTER pb on the opposite side in order to recover the OIS displayed on the outer display units and the MFD displayed on the center lower display unit.

- Displays:
  - The video from the ETACS ◁ on the PFD and/or on the VIDEO SD page
  - The video from the CDSS ◁ , the CVMS ◁ and the Lower Deck Surveillance Function ◁ on the VIDEO SD page only
  - The OIS information.

The CMV system has two Concentrator and Multiplexer for Video modules, as CMV 1 and CMV 2.
L2 Only the CMV 1 provides live video from the ETACS ◁ to the IFE for passenger entertainment.
In the case of a video failure, the corresponding part of the display is a black area (*Refer to DSC-31-CDS-110-20 Video Messages*).

Ident.: DSC-31-CDS-110-10-10-00001489.0001001 / 09 MAR 16

VIDEO SD PAGE

The VIDEO SD page can display:

- The CDSS ◁ videos
- The ETACS ◁ videos
- The CVMS ◁ videos
- The videos from Lower Deck Surveillance Function ◁ .

Ident.: DSC-31-CDS-110-10-10-00011289.0001001 / 18 APR 14

OIS DISPLAY

The CMV displays OIS information on the OIS displays, or on the center lower display unit.
For more information about OIS display reconfiguration, *Refer to DSC-31-CDS-30-30 Normal Operations*.

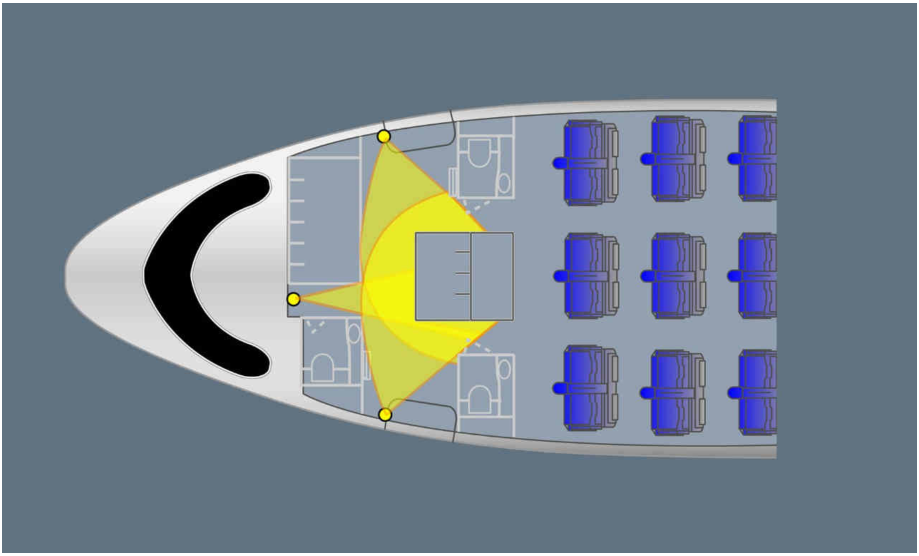
COCKPIT DOOR SURVEILLANCE SYSTEM ⋞

Ident.: DSC-31-CDS-110-10-00001484.0001001 / 28 APR 17
Applicable to: ALL

There are three cameras that enable the flight crew to identify who is requesting entry to the cockpit, before authorizing (or not) their access.

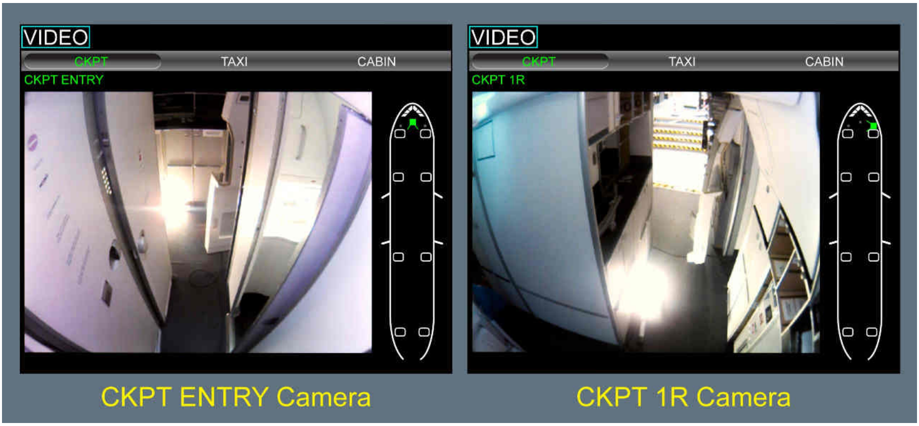
The CDSS has three cameras:
- One camera monitors the cockpit door
- Two cameras monitor the hidden cross section between the right and the left forward doors.

Cockpit Door Cameras



The live video images from these three cameras appear on the VIDEO SD page, in one of the following views:
- A full image of cockpit door entry area, or
- A full image of the cross section from the camera that are next to the left/right forward doors.

Cockpit Door Cameras



CKPT ENTRY Camera CKPT 1R Camera

The VIDEO SD page automatically displays the video image of the cockpit door entry area, if:
- The emergency cockpit access is requested, or
- In flight, the routine cockpit access is requested, and the ECAM displays the CRUISE page.

L2 If the VIDEO SD page is not automatically displayed, the flight crew can press the VIDEO pb on the ECP.

L1 The flight crew can also display images from these cameras without a request for cockpit access, via dedicated controls on the ECP. For a detailed description, *Refer to DSC-31-CDS-110-20 ECP*.

EXTERNAL AND TAXIING AID CAMERA SYSTEM ✻

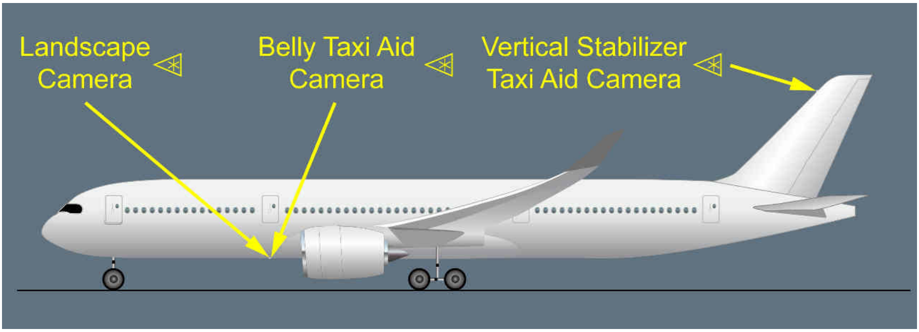
Ident.: DSC-31-CDS-110-10-00019119.0002001 / 09 MAR 16
Applicable to: ALL

The ETACS provides the flight crew an external view of the aircraft, in order to:

- Monitor external activities on ground (maintenance operations, airport activities,...)
- Make taxiing easier
- Perform a visual check of the external environment during the flight.

There are several cameras on the exterior of the aircraft that provide the external view of the aircraft.

These cameras are:
- The Belly Taxi Aid Camera ✻ (TAC) and the Vertical Stabilizer TAC ✻
- The Landscape camera ✻ .



Cameras Location

TAXI AID CAMERAS

BELLY TAXI AID CAMERA ◁

The Belly TAC provides live video images of:
- The NLG
- The ground marking
- The front of the aircraft
- 9 m (30 ft) on each side of the NLG.

VERTICAL STABILIZER TAXI AID CAMERA ◁

The Vertical Stabilizer TAC provides live video images of:
- The front of the aircraft
- The taxiway/runway
- Both engines
- The main landing gears
- A part of the wings trailing edge.

USE OF THE TAXI AID CAMERAS

The live video images from the Belly TAC ◁ and Vertical Stabilizer TAC ◁ can be displayed in the cockpit, and help the flight crew:
- To taxi the aircraft on the taxiway/runway centerline
- To evaluate the margin between the landing gears and the taxiway/runway edge for any maneuvers (e.g. a 180 ° turn).

For more information, *Refer to FCTM/PR-NP-SOP-100 External Taxi Aid Camera System*.

The live video images from the Belly TAC and the Vertical Stabilizer TAC can be displayed on:

- The PFDs, when the aircraft is on ground and the speed below 60 kt
- The SD, on ground or in flight.

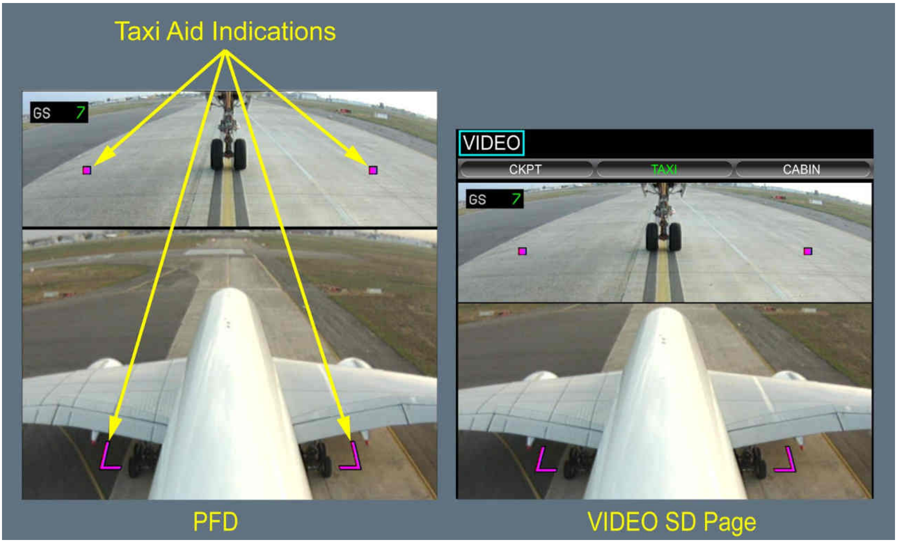
The flight crew can manually display the ETACS camera view:

- On the PFD, via the TAXI pb on the EFIS CP. For more information, *Refer to DSC-31-CDS-40-60 TAXI pb*
- On the VIDEO SD page, via dedicated controls on the ECP. For more information, *Refer to DSC-31-CDS-60-20 VIDEO Controls*

The live video images from these two cameras are displayed as follows:

- The upper part of the display provides the video from the Belly TAC . Two magenta squares, one located on each side of the NLG, indicate a lateral 5 m (16 ft) distance from the NLG
- The lower part of the display provides the video from the Vertical Stabilizer TAC . A magenta position indicator located on each outer side of the MLG helps the flight crew to determine the position of the MLG in relation with the runway centerline or the taxiway/runway edge.

Taxi Aid Indications



For using the ETACS in night condition, the lighting is ensured by external lights.

For more information, *Refer to Camera Lights*.
These two cameras are also connected to the IFE that enables to display the live video images for passengers entertainment.

LANDSCAPE CAMERA ⊲

The landscape camera provides live video images downward of the aircraft, only displayed by the IFE for passengers entertainment.

Note: *In accordance with the situation during the flight (abnormal or emergency situation), the flight crew can inhibit the live video images transmission from the three cameras (Belly TAC, Vertical Stabilizer TAC and Landscape camera) to the IFE by pressing the LANDSCAPE CAMERA pb-sw on the overhead CABIN panel.*

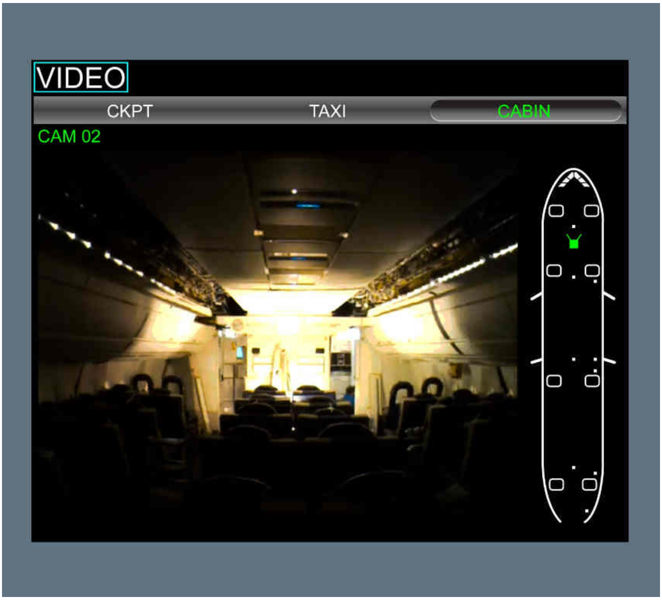
CABIN VIDEO MONITORING SYSTEM ⊲

Ident.: DSC-31-CDS-110-10-00019207.0001001 / 07 JUL 16
Applicable to: ALL

The CVMS helps the flight crew to monitor the cabin status without leaving the cockpit.
The CVMS includes several video cameras that are installed throughout the cabin.
The flight crew can display the cabin video images from each camera on the VIDEO SD page, via dedicated controls on the ECP. For more information, *Refer to DSC-31-CDS-60-20 VIDEO Controls*
The cabin crew can also observe the cabin video images on the Flight Attendant Panels (FAPs).

L2 Depending on the aircraft customization, if the cabin crew activates the ECAS ⊲ :
- An aural alert sounds in the cockpit
- The VIDEO SD page automatically appears for 5 s and displays the affected cabin area.

Cabin Camera



LOWER DECK SURVEILLANCE FUNCTION

Ident.: DSC-31-CDS-110-10-00019225.0001001 / 09 MAR 16
Applicable to: ALL

The Lower Deck Surveillance Function is a video surveillance system installed in forward, aft and bulk cargo compartments.

The Lower Deck Surveillance Function enables:
- On ground, the monitoring of loading/unloading activities for damage prevention, theft...
- In flight, increased security (smoke/fire detection, damage...).

The Lower Deck Surveillance Function has several video cameras installed in all cargo compartments. The cameras enable to monitor all access doors and the entire empty cargo compartment.
On ground and in flight, the flight crew can monitor all cargo compartments on the VIDEO SD page.

OVERVIEW

Applicable to: ALL

Ident.: DSC-31-REC-10-10-00011484.0001001 / 24 APR 14

The aircraft records flight data parameters, audio communication, and Air Traffic Control (ATC) datalink communication via:
- The Recorder System, and
- The Aircraft Condition Monitoring System (ACMS), and
- The Cockpit Voice Recorder (CVR).

RECORDER SYSTEM

The Recorder System records the mandatory flight data parameters from the aircraft systems, and stores the flight data parameters in:

- The Digital Flight Data Recorder (DFDR)

L2 The DFDR stores the flight data parameters of the last 25 hours of operation.

L1
- The Virtual Quick Access Recorder (VQAR).

Note: The DFDR and the VQAR store the same set of flight data parameters. The Operator cannot customize the set of recorded flight data parameters.

Ident.: DSC-31-REC-10-10-00011491.0001001 / 24 APR 14

AIRCRAFT CONDITION MONITORING SYSTEM (ACMS)

The ACMS records the flight data parameters from the aircraft systems, in order to generate reports, and to record predefined sets of flight data.

L3 The Operator can customize the content and the triggering conditions of the reports and recordings.

Ident.: DSC-31-REC-10-10-00001512.0001001 / 24 APR 14

COCKPIT VOICE RECORDER (CVR)

The Cockpit Voice Recorder (CVR) records:

- Voice communications from and to the cockpit, and
- Cockpit sounds (include all aural alerts), and
- ATC datalink communication.

L2 The CVR keeps a recording of the most recent 2 h of communication.

Overview

GENERAL

Ident.: DSC-32-10-10-10-00002197.0001001 / 30 APR 14
Applicable to: ALL

The A350 has:
- One Nose Landing Gear (NLG)
- Two Main Landing Gears (MLG).

The Landing Gear Extension and Retraction System (LGERS) extends and retracts the NLG and the MLG.

NOSE LANDING GEAR (NLG)

Ident.: DSC-32-10-10-10-00012144.0001001 / 30 APR 14
Applicable to: ALL

The NLG is located in the forward lower fuselage, on the aircraft centreline. The NLG is a forward retracting gear. The NLG is hydraulically operated by a single Extension/Retraction Actuator.

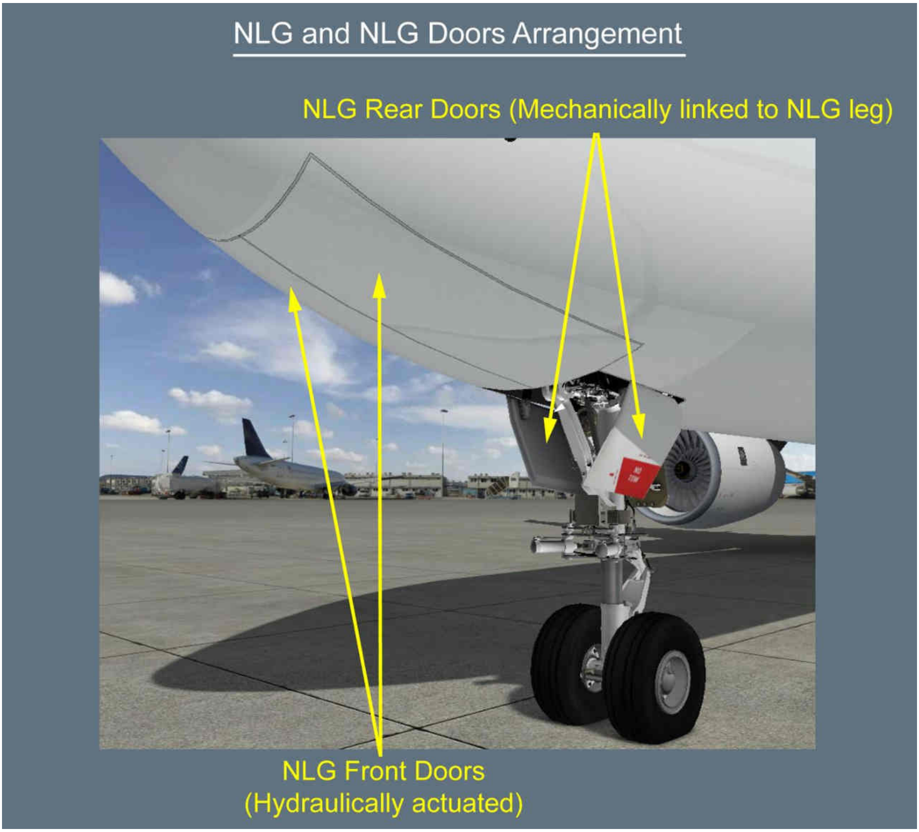
L2 The NLG is a twin wheel gear equipped with an oleo shock absorber.

L1 The NWS is operated, thanks to two steering actuators. For more information, *Refer to NWS Actuators*.

The NLG bay is fitted with four doors:
- Two rear doors that are mechanically linked to the NLG
- Two front doors, each operated by a single hydraulic actuator.

L2 In normal operation, when the NLG is extended, the rear doors are open, and the front doors are closed.

Arrangement of the NLG, and NLG doors



NLG and NLG Doors Arrangement
NLG Rear Doors (Mechanically linked to NLG leg)
NLG Front Doors
(Hydraulically actuated)

MAIN LANDING GEAR (MLG)

Ident.: DSC-32-10-10-10-00012146.0002001 / 30 APR 14
Applicable to: ALL

The MLG includes two MLG segments, one under each wing.
Each MLG segment retracts sideways into its MLG bay in the fuselage.
The MLG bogies have four wheels in a twin tandem configuration.
L2 Each MLG segment has an oleo shock absorber.

L1 Each MLG has three doors:

- Two doors that are mechanically linked to the MLG segment (leg)
- One MLG bay door that is operated by a single hydraulic actuator.

L2 In normal operation, when the MLG is extended, the mechanically-operated doors stay open, and the hydraulically-operated door is closed.

Arrangement of the MLG, and MLG Doors

Landing Gear Extension Retraction System (LGERS)

GENERAL

Ident.: DSC-32-10-10-20-00002198.0001001 / 30 APR 14
Applicable to: ALL

The LGERS is divided into three systems:
- The normal extension/retraction system
- The alternate extension system
- The ground door opening system.

L/G EXTENSION AND RETRACTION EQUIPMENT

LANDING GEAR AND LANDING GEAR DOORS ACTUATORS

Hydraulic actuators operate the L/G and L/G doors. In normal operation, the aircraft hydraulic system powers the L/G and L/G doors actuators.

Ident.: DSC-32-10-10-20-10-00002211.0001001 / 13 JAN 15

LANDING GEAR LOCK-STAYS

The lock-stays secure the L/G in the extended position.

L3 The downlock mechanism is mechanical, and is achieved via downlock springs.

L1 When the aircraft is on the ground, locking pins are installed on each landing gear lock-stay to mechanically prevent the retraction of the L/G.

L2 For more information about external walkaround SOP, *Refer to PRO-NOR-SOP-50 General*.

Ident.: DSC-32-10-10-20-10-00012147.0001001 / 30 APR 14

Lock-stay unlock actuators release the lock-stays from the downlock position for retraction of the L/G.

L2 The lock-stay unlock actuators are commanded by the NLG and MLG selector valves. For more information, *Refer to Hydraulic Power Supply.*

Ident.: DSC-32-10-10-20-10-00002210.0001001 / 30 APR 14

BOGIE PITCH TRIMMER ACTUATORS

A bogie pitch trimmer actuator holds each MLG bogie in a correct pitch attitude when the gear is not in contact with the ground.

L2 The green hydraulic system provides hydraulic power to the pitch trimmer actuators.

L3 The hydraulic pressure in the pitch trimmer actuators is low. Therefore, when the aircraft is on the ground, the bogies are forced to the horizontal position by the weight of the aircraft.
The bogie pitch trimmer actuators are the only gear retraction / extension hydraulic equipment permanently pressurized, including when gears are uplocked.

Ident.: DSC-32-10-10-20-10-00002203.0001001 / 30 APR 14

L3 L/G AND L/G DOORS UPLOCKS

The uplocks hold the L/G in the retracted position, and the L/G doors in the closed position.

Each uplock has:
- A locking hook that mechanically locks the gear/door when the L/G is up.
- Two hydraulic actuators that release the locking hook:
  - One normal unlock actuator that is controlled by the active L/G CTL System.
  - One alternate unlock actuator that is controlled by the alternate extension system for L/G gravity extension.

LGERS HYDRAULIC POWER SUPPLY

Applicable to: ALL

Ident.: DSC-32-10-10-20-20-00012321.0001001 / 30 APR 14

NORMAL HYDRAULIC POWER SUPPLY

The YELLOW hydraulic system powers:
- The normal extension/retraction of the NLG
- The normal operation of the NLG doors.

The GREEN hydraulic system powers:
- The normal extension/retraction of the MLG
- The normal operation of the MLG doors.

L2 *Note: The LGERS is pressurized only during the extension and the retraction phases. At all other flight phases, the LGERS is isolated from hydraulic pressure by closing the isolation valves (Refer to Isolation valves).*

Ident.: DSC-32-10-10-20-20-00012322.0001001 / 30 APR 14

ALTERNATE HYDRAULIC POWER SUPPLY

Two alternate power packs provide independent hydraulic power to the L/G alternate extension system.
L2 The alternate power packs provide hydraulic power to the uplocks to release the doors and gears.
L3 Each alternate power pack converts electrical power to hydraulic power using two electrical pumps. Each pump is powered by a different electrical supply.
L2 Each alternate power pack has its own hydraulic fluid reservoir.
L1 One alternate power pack operates the NLG alternate extension and the other alternate power pack operates the MLG alternate extension.

Ident.: DSC-32-10-10-20-20-00002371.0001001 / 30 APR 14

L2 LANDING GEAR ISOLATION VALVES

There are two L/G isolation valves:
- One for the NLG
- One for the MLG.

The L/G isolation valves close and isolate the associated landing gear from the hydraulic power (YELLOW for NLG or GREEN for MLG). The L/G isolation valves also isolate the normal hydraulic system during alternate extension operation through the alternate power pack.

Ident.: DSC-32-10-10-20-20-00002205.0001001 / 30 APR 14

L2 LANDING GEAR SELECTOR VALVES

There are four L/G selector valves
- One selector valve for the NLG actuators
- One selector valve for the MLG door actuators
- One selector valve for the NLG extension/retraction actuator and the NLG lock-stay unlock actuator
- One selector valve for both MLG extension/retraction actuators and both MLG lock-stay unlock actuators.

The selector valves control the hydraulic power that is supplied to the actuators.

NORMAL EXTENSION/RETRACTION SYSTEM

Applicable to: ALL

Ident.: DSC-32-10-10-20-30-00002199.0001001 / 30 APR 14

In normal operation, the flight crew selects the extension/retraction of the landing gear, via the landing gear lever.
The LGERS uses hydraulic power to actuate the landing gear and the landing gear doors.

Ident.: DSC-32-10-10-20-30-00002202.0001001 / 13 JAN 15

G

The L/G CTL system controls the LGERS and has two redundant control systems referred to as L/G CTL 1 and L/G CTL 2.
One L/G CTL system is active and controls the LGERS, while the other is passive.
L2 The passive L/G CTL system automatically activates if the active L/G CTL system fails.
The active L/G CTL system changes when the L/G lever is moved from down to up.

L1 Two Landing Gear Control and Indication Systems (LGCIS) command each L/G CTL system:

L3
- LGCIS 1 is hosted in CPIOM H61 and CPIOM H63 for L/G CTL 1
- LGCIS 2 is hosted in CPIOM H62 and CPIOM H64 for L/G CTL 2.

L1 When the flight crew sets the L/G lever to UP or DOWN, the active L/G CTL system generates and sends the appropriate electrical commands in sequence to:
- Retract and secure the L/G in the retracted position (uplock), or
- Extend and secure the L/G in the extended position (downlock).

L2 *Note: It takes about 20 s to extend or retract the L/G.*

Ident.: DSC-32-10-10-20-30-00012271.0001001 / 06 MAR 15

L3 The following conditions must be satisfied before the retraction sequence is initiated:
- The nose wheel steering is centred and the NLG shock absorber is fully extended
- Both MLG shock absorbers are fully extended
- Both MLG bogies are in the tilted position.

L2 All gears are retracted simultaneously.

L1 Upon L/G retraction demand, when the flight crew sets the L/G lever to UP:
- L3 The active L/G CTL system changes over
- The isolation valves open to provide normal hydraulic power supply
- L2 The L/G CTL system commands the doors uplock to open
- L1 The L/G CTL system commands the doors to open
- Once the doors are opened, the L/G CTL system commands the lock-stay unlock actuators to release the L/G from the downlock position, and the L/G to retract
- Once the L/G is uplocked, the L/G CTL system commands the doors actuators to close the doors.

Ident.: DSC-32-10-10-20-30-00012272.0001001 / 03 DEC 15

Upon L/G extension demand, when the flight crew sets the L/G lever to DOWN:
- L3 The isolation valves open to provide normal hydraulic power supply
- L2 The L/G CTL system commands the doors uplock to release the doors
- L1 The L/G CTL system commands the doors to open
- L2 Once the doors are open, the L/G CTL system commands the gears uplock to release the gears
- L1 The L/G CTL system commands the gears to extend

- The L/G are locked mechanically in the downlock position by the lock-stays, thanks to the downlock springs
- The LGCIS commands the doors to close.

Ident.: DSC-32-10-10-20-30-00002204.0001001 / 07 NOV 16

PROXIMITY SENSORS

The proximity sensors provide the L/G CTL system with feedback on L/G and L/G doors position.

L3 Each L/G CTL system has an assigned set of proximity sensors, and receives the following data:
- L/G uplocked or downlocked
- L/G doors fully open or uplocked
- Shock absorber fully extended
- Bogies in flight or on ground position
- Nose Wheel centered.

L1 The landing gear position data is sent to:
- The ECAM for the generation of alerts and the display of the WHEEL SD page
- The PFD for the landing gear position indication on the Slats/Flaps display.
- The FWS, for the red arrow indication on the L/G lever panel.

L2 The L/G CTL system also computes a consolidated Weight on Wheel information based on the proximity sensors data. This information is then transmitted to various aircraft system and used in the elaboration of their own ground/flight status.
On each gear lock-stay, an additional proximity sensor provides an independent gear downlock indication to the ECAM and PFD.

ALTERNATE EXTENSION SYSTEM

Applicable to: ALL

Ident.: DSC-32-10-10-20-40-00002368.0001001 / 30 APR 14

When the normal extension of L/G fails, the flight crew can perform a gravity extension via the L/G GRVTY EXTN selector.
The gravity extension of the L/G does not use normal hydraulic power supply.
Two alternate power packs provide hydraulic power to release the L/G from the uplock position. One for the NLG and one for the MLG.
L2 After a gravity extension, all the L/G doors remain open.

Ident.: DSC-32-10-10-20-40-00012323.0001001 / 30 APR 14

Two Alternate Extension Control Modules (AECMs) command the alternate extension of the landing gear.

The AECMs and the L/G CTL system are independent.

L3 The two AECMs operate simultaneously and independently to ensure that one supply is always available.

Ident.: DSC-32-10-10-20-40-00002370.0001001 / 03 DEC 15

GRAVITY EXTENSION SEQUENCE

When the flight crew sets the L/G GRVTY EXTN selector to the DOWN position, the AECMs send the appropriate electrical commands to the alternate power packs to extend the landing gear by gravity. The MLG is released first and 30 s later the NLG releases.

L3 When the flight crew selects the L/G GRVTY selector to down, the alternate extension sequence is as follows:

1. The motors of the alternate power packs start (MLG first and NLG 30 s later).
2. The AECMs ensure the closure of the NLG and MLG isolation valves to isolate the LGERS from the normal hydraulic supply.
3. Hydraulic pressure from the alternate power packs unlocks the door uplocks and doors start to open by gravity.
4. Hydraulic pressure from the alternate power packs unlocks the gear uplocks and the gears extend by gravity and downlock in the extended position.

L1 The total duration of the L/G gravity sequence should not exceed 90 s.
The landing gear position indications remain available during a gravity extension from the NLG and MLG proximity sensors.

L/G GROUND DOOR OPENING

Ident.: DSC-32-10-10-20-00002201.0001001 / 13 JAN 15
Applicable to: ALL

L2 For maintenance purposes, the landing gear doors can be opened and closed on the ground via the ground door opening levers (one per landing gear).
The landing gear doors open by gravity and need hydraulic pressure to be closed.
L3 The Landing Gear Control and Indication System (LGCIS) commands the closing sequence.

INTERFACE WITH OTHER SYSTEMS

Ident.: DSC-32-10-10-20-00002207.0001001 / 03 APR 20
Applicable to: ALL

L3 The LGCIS receives airspeed data from the ADIRS to inhibit the extension of the landing gear above 260 kt or M 0.6.
The LGCIS sends the "weight on wheels" (ground/flight) data to all other aircraft systems.

These systems are:
- The Air Conditioning System
- The Air Data/Inertial Reference System (ADIRS)
- The Aircraft Condition Monitoring System (ACMS)
- The Airport Navigation Function (ANF)

- The Anti-Ice System
- The Auto Flight System (AFS)
- The Automatic Direction Finder (ADF) ◁

Overview

GENERAL

Ident.: DSC-32-20-10-10-00012752.0001001 / 30 APR 14
Applicable to: ALL

The braking system enables:

- Manual braking via flight crew action on:
  - The brake pedals
L2 The brake pedals, that are on the Captain (CAPT) and the First Officer (F/O) sides of the cockpit, are mechanically linked to each other.
  - L1 The PARK BRK handle.
  - L2 The steering handwheel (when backup steering is used)
- L1 Automatic braking via:
  - The basic Autobrake (A/BRK) function
  - The Brake To Vacate (BTV) function
  - The Runway Overrun Protection (ROP) function.
  - L2 The retraction braking that automatically reduces the speed of the MLG wheels, when the landing gear retracts.

L1 There are four braking modes:

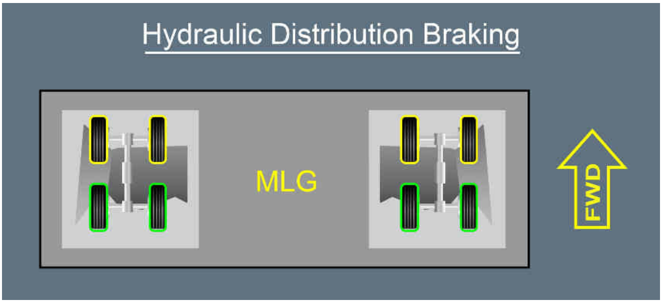
- Normal braking
- Alternate braking
- Emergency braking
- Parking brake.

BRAKES

Ident.: DSC-32-20-10-10-00012753.0001001 / 30 APR 14
Applicable to: ALL

The aircraft has carbon brakes. Each MLG wheel has one brake.
One wheel group corresponds to all wheel brakes which are supplied by the same hydraulic system (GREEN or YELLOW).
Each brake has a visual wear indicator. When the parking brake is on, the flight crew can visually check the wear of the MLG brakes (*Refer to Before Walkaround*).

Hydraulic Distribution BRAKING



The GREEN and YELLOW hydraulic circuits are used for braking as illustrated above.

WHEEL FUSE PLUGS

Ident.: DSC-32-20-10-10-00012754.0001001 / 30 APR 14
Applicable to: ALL

Each MLG wheel has fuse plugs that prevent the wheel and tire from bursting. In the case of a brake overheat, the fuses melt and the tire deflates.

BRAKES CONTROL SYSTEM (BRAKES CTL)

Ident.: DSC-32-20-10-20-00012720.0001001 / 06 MAR 15
Applicable to: ALL

The Brakes Control System (BRAKES CTL) controls the normal, and the alternate braking modes.
The system has two redundant modules, referred to as Brakes Control System 1 (BRAKES CTL 1) and BRAKES CTL 2.
One BRAKES CTL is active when the other one is a backup.
L2 The backup BRAKES CTL automatically activates if the active BRAKES CTL fails.
The active BRAKES CTL changes after each landing gear extension.

L3
- BRAKES CTL 1 is hosted by CPIOM-H61 and CPIOM-H63
- BRAKES CTL 2 is hosted by CPIOM-H62 and CPIOM-H64.

L1 The flight crew commands each BRAKES CTL via:
- The brake pedals
- The A/BRK pb
- The A-SKID sw
- The ACCU REINFLATE pb.
- L2 The steering handwheel (when backup steering is used)
- The L/G lever.
  In normal braking mode, the retraction braking activates when the L/G lever is set to the UP position.

The active BRAKES CTL commands the Remote Braking Control Unit (RBCU) for control of the normal and/or to the alternate hydraulic equipments of the braking system.
The BRAKES CTL also sends data to the ECAM, in order to generate alerts, and to display the WHEEL SD page.

REMOTE BRAKING CONTROL UNITS (RBCU)

: Control of the Yellow powered wheel group
: Control of the Green powered wheel group

There are two RBCUs.

Each RBCU controls its dedicated wheel group, and can provide alternate and EMER braking control to the other group in the case of braking mode reconfiguration:
- RBCU 1 controls the MLG wheels powered by the GREEN hydraulic system
- RBCU 2 controls the MLG wheels powered by the YELLOW hydraulic system.

L2 Each RBCU has three channels: A, B, and E. Channels A and B are digital channels. Channel E is an analogical channel.

- Channel A controls normal braking of the associated wheel group.
- Channel B controls:
  - Normal braking (backup of channel A) of the associated wheel group
  - Alternate braking of the associated wheel group
  - Alternate braking of the other wheel group (backup of the other RBCU channel B)
  - Emergency braking of both the associated and other wheel group (digital control)
- Channel E controls emergency braking (analogical control) of the associated wheel group.

L1 The RBCUs receive inputs from:

- The active BRAKES CTL for manual or automatic braking control
- The brake pedals for normal or alternate braking control (if BRAKES CTL is not available)
- The brake pedals for emergency braking
- The ANTI SKID sw
- The tachometers
- The brake pressure transducers.

The RBCU performs the antiskid function. (*Refer to Antiskid Presentation).*

L2 The RBCU computes and sends the corresponding electrical commands to the hydraulic equipment of the braking system.
The RBCU also sends data to the BRAKES CTL that relays the fault data to the ECAM to generate alerts.
In the case of BRAKES CTL failure, the RBCU can send data directly to the ECAM to generate alerts.

TACHOMETERS

Ident.: DSC-32-20-10-20-00012723.0001001 / 30 APR 14
Applicable to: ALL

Each MLG wheel is equipped with a tachometer that measures the wheel rotation speed.
The tachometers send the wheel speed value to the RBCUs.

BRAKE PRESSURE TRANSDUCERS

Ident.: DSC-32-20-10-20-00012724.0001001 / 30 APR 14
Applicable to: ALL

Each MLG wheel brake has a brake pressure transducer to monitor the hydraulic pressure supplied to each brake.

INTERFACE WITH OTHER SYSTEMS

Ident.: DSC-32-20-10-20-00012734.0001001 / 30 APR 14
Applicable to: ALL

L3 The BRAKES CTL exchanges data with:
- The flight control system and the Auto Flight System (AFS) for flight calculations and the ground control laws
- The Hydraulic system (HYD)
- The Air Data and Inertial Reference System (ADIRS)
- The Propulsion Control System (PCS)
- The Landing Gear Extension/Retraction System (LGERS)
- The Landing Gear Monitoring System (LGMS)
- The Flight Data Recording System (FDRS)
- The Central Maintenance System (CMS)
- The Control and Display System (CDS)
- The Electrical system (ELEC)
- The Flight Warning System (FWS).

Intentionally left blank

Braking System Hydraulic Architecture

GENERAL

Ident.: DSC-32-20-10-30-00012725.0001001 / 30 APR 14
Applicable to: ALL

The hydraulic power supply of the braking system is divided into two networks:
- The normal hydraulic network
- The alternate hydraulic network.

NORMAL HYDRAULIC NETWORK

Applicable to: ALL

Ident.: DSC-32-20-10-30-10-00012726.0001001 / 30 APR 14

In normal braking mode:

- The YELLOW normal hydraulic system supplies hydraulic power to the front MLG wheels
- The GREEN normal hydraulic system supplies hydraulic power to the rear MLG wheels.

Ident.: DSC-32-20-10-30-10-00012728.0001001 / 30 APR 14

L2 NORMAL BRAKING SELECTOR VALVE (NBSELV)

There are four NBSELVs. Each wheel pair of the MLG bogies has one NBSELV.

The NBSELVs have two functions:
- Provide pressure from the main hydraulic supply to the Normal Servo Valves (NSVs) for braking demand
- Isolate the braking circuit from the aircraft hydraulic supply.

Ident.: DSC-32-20-10-30-10-00012729.0001001 / 30 APR 14

L2 NORMAL SERVO VALVE (NSV)

There are eight NSVs. Each MLG wheel has one NSV.
When braking is commanded, the NSVs ensure regulated pressure from the normal hydraulic supply to the associated wheel brake.

For the alternate hydraulic system, two reinflatable hydraulic accumulators achieve the hydraulic supply redundancy.

Each accumulator supplies hydraulic power to the corresponding wheels in the case of a failure of the normal hydraulic system:

- One accumulator is reinflated by the YELLOW hydraulic system, and supplies the MLG front wheels
- One accumulator is reinflated by the GREEN hydraulic system, and supplies the MLG rear wheels.

The alternate hydraulic power supply is used for:

- Alternate braking
- Emergency braking
- Parking brake and ultimate braking.

Ident.: DSC-32-20-10-30-20-00012730.0001001 / 07 NOV 16

ACCUMULATORS REINFLATION

Accumulators can be reinflated either manually by pressing the ACCU REINFLATE pb or automatically.
On ground, when both engines are OFF, the flight crew can manually reinflate the accumulators by pressing the ACCU REINFLATE pb on the PARK BRK panel.
On ground, the BRAKES G(Y) ACCU PRESS LO alert warns the flight crew if the accumulator pressure is below a specified threshold and requests a manual reinflation.
On ground, when at least one engines is running, the accumulators are automatically reinflated. This ensures that the aircraft has the maximum accumulator pressure in the case of a RTO.
In flight, the accumulators are automatically reinflated to maximize alternate braking performance at landing.

L3 An automatic reinflation is triggered:

- As soon as the accumulator pressure goes below 180 bar (2 600 PSI), or
- Every hour if the accumulator pressure transducer is inoperative.

Ident.: DSC-32-20-10-30-20-00012731.0001001 / 30 APR 14

L2 ALTERNATE REFILL VALVE (ARV)

There are two Alternate Refill Valves (ARVs) that connect to the hydraulic power supplies to reinflate the accumulators.
The active BRAKES CTL automatically commands the ARVs. They can also be opened by pressing the ACCU REINFLATE pb.

Ident.: DSC-32-20-10-30-20-00012732.0001001 / 30 APR 14

L2 ALTERNATE BRAKING SELECTOR VALVE (ABSELV)

There are two ABSELVs. Each wheel group has one ABSELV.

The ABSELVs have two functions:
- Provide pressure from the accumulator to the ASV for braking demand
- Isolate the braking circuit from the alternate hydraulic supply.

Ident.: DSC-32-20-10-30-20-00012733.0001001 / 30 APR 14

L2 ALTERNATE SERVO VALVE (ASV)

There are four ASVs: one for each wheel pair of the MLG bogies.

The ASVs have two functions:
- Provide regulated pressure from the accumulator to the wheel brake when alternate braking (or alternate braking without antiskid) is commanded.
- Provide full pressure from the accumulator to the wheel brake when park braking is commanded.

Ident.: DSC-32-20-10-30-20-00020893.0001001 / 30 APR 14

L2 PARKING BRAKE SELECTOR VALVE (PBSELV)

There are two PBSELVs. Each wheel group has one PBSELV.
When the PARK BRK handle is set to the ON position, the PBSELVs open and hydraulic pressure from the brake accumulators is sent to the brakes.

Braking Modes

GENERAL

Ident.: DSC-32-20-10-40-00012735.0001001 / 30 APR 14
Applicable to: ALL

There are four braking modes:
- Normal braking
- Alternate braking
- Emergency braking
- Parking brake.

Depending on the available avionics and hydraulic supply, the braking system can use one of the four braking modes.
In order to minimize the consequences of a local failure, the YELLOW wheel group and the GREEN wheel group of the MLG can operate independently in a different braking mode.
The active braking mode is displayed on the WHEEL SD page.
L2 For more information about the WHEEL SD page, *Refer to DSC-32-20-20 Braking Mode Indications*.

NORMAL BRAKING

In normal braking mode:
- A-SKID is available
- A/BRK is available (if at least one BRAKES CTL is operative)
- Wheels are controlled individually

L2 - Nose-high braking law is active

L3 The nose-high braking law limits the braking force on the MLG to reduce the nose-down movement and avoid a hard touchdown of the NLG.

- L2 Automatic retraction braking is available (if at least one BRAKES CTL is operative)
- L2 Backup steering function is available (through differential braking) in the case of Nose Wheel Steering (NWS) failure (if at least one BRAKES CTL is operative).

The BRAKES CTLs acquire the braking orders from the brake pedals or compute the braking demand according to the active autobrake function.

The active BRAKES CTL sends the braking demand to the RBCUs. The RBCUs uses feedback from the tachometers and the pressure transducers to:
- Apply antiskid protection
- Supply hydraulic pressure via the NBSELVs
- Regulate the brake pressure via each NSV in order to provide optimum braking performance.

When a wheel group operates in normal braking mode, the ABSELV remains closed to isolate the brakes from the alternate hydraulic network.

ALTERNATE BRAKING

In alternate braking mode:

- Hydraulic power is provided by the accumulator (braking performance is degraded)
- A-SKID is available, provided that the accumulator pressure is more than 1 600 PSI (110 bar)
- A/BRK is available, provided that at least one BRAKES CTL is operative and the accumulator pressure is more than 1 600 PSI (110 bar)
- Pedal braking is available via the brake pedals.

L2 - Nose-high braking law is active

L3 The nose-high braking law limits the braking force on the MLG to reduce the nose-down movement and avoid a hard touchdown of the NLG.

L2 - Automatic retraction braking is not available

L2 - Backup steering function is available (through differential braking) in the case of Nose Wheel Steering (NWS) failure, provided that the GREEN hydraulic system is not affected.

L1 The green hydraulic network and the yellow hydraulic network are individually controlled. Therefore, one wheel group may be in alternate braking mode while the other is in normal braking mode.
The hydraulic power supplied by the accumulator is sufficient to provide one full braking from touchdown to the complete stop of the aircraft.

L2 The BRAKES CTLs acquire the braking orders from the brake pedals or compute the braking demand according to the active autobrake function.

The active BRAKES CTL sends the braking demand to the RBCUs. The RBCUs uses feedback from the tachometers and the pressure transducers to:
- Apply antiskid protection
- Supply hydraulic pressure via the ABSELVs
- Regulate the brake pressure via each ASV, in order to provide optimum braking performance.

When a wheel group operates in alternate braking mode, the NBSELV remains closed to isolate the brakes from the normal hydraulic network.

EMERGENCY BRAKING

In emergency braking mode:
- Hydraulic power is provided by the accumulator (braking performance is degraded)
- Manual braking is available via the brake pedals
- The brake pressure is automatically limited to 1 130 PSI (78 bar)
- The flight crew can apply pedal braking at least 6 times.

L2 After 6 brake applications, the accumulator still contains enough fluid for use of the parking brake.

The RBCUs acquire the braking order from the brake pedals.

L2 The RBCUs command:
- L2 The Alternate Brake Selector Valves (ABSELVs) to open, in order to supply hydraulic pressure
- L2 Each Alternate Servo Valve (ASV) to open, in order to provide the braking pressure.

When a wheel group operates in emergency braking mode, the NBSELV remains closed to isolate the brakes from the normal hydraulic network.

PARKING BRAKE

The parking brake uses the alternate hydraulic supply (braking accumulators) of the braking system. Once the PARK BRK handle is set to the ON position, full accumulators pressure is applied to the brakes.

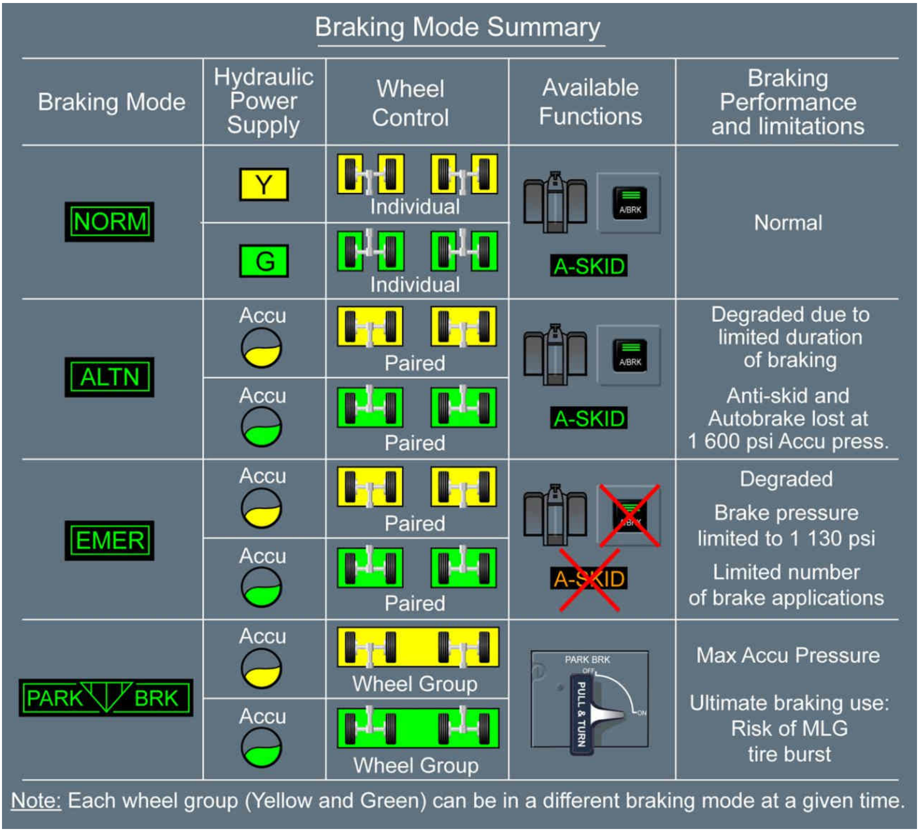
Note: The parking brake is also usable as ultimate braking means.

L2 The Parking Brake Selector Valves (PBSELVs) open to provide the full accumulator pressure.

L1 With nominal accumulators pressure and aircraft not powered, the parking brake is effective for 12 h.

SUMMARY OF BRAKING MODES

Ident.: DSC-32-20-10-40-00012740.0001001 / 30 APR 14
Applicable to: ALL



Braking Mode Summary

Braking Mode	Hydraulic Power Supply	Wheel Control	Available Functions	Braking Performance and limitations
NORM	Y	Individual	A/BRK A-SKID	Normal
	G	Individual		
ALTN	Accu	Paired	A/BRK A-SKID	Degraded due to limited duration of braking Anti-skid and Autobrake lost at 1 600 psi Accu press.
	Accu	Paired		
EMER	Accu	Paired	~~A/BRK~~ ~~A-SKID~~	Degraded Brake pressure limited to 1 130 psi Limited number of brake applications
	Accu	Paired		
PARK BRK	Accu	Wheel Group	PARK BRK OFF ON PULL & TURN	Max Accu Pressure Ultimate braking use: Risk of MLG tire burst
	Accu	Wheel Group		

Note: Each wheel group (Yellow and Green) can be in a different braking mode at a given time.

Braking Functions

AUTOBRAKE

Applicable to: ALL

Ident.: DSC-32-20-10-50-10-00012741.0002001 / 17 NOV 17

GENERAL

The A/BRK is a function of the BRAKES CTL that automatically decelerates the aircraft during landing, or in the case of a rejected takeoff (RTO).

L2 The A/BRK:
- Avoids any delay for brake application in the case of a RTO
- Reduces flight crew workload during landing, by maintaining a constant deceleration rate
- Reduces the number of brake applications, and therefore, brake wear.

L1 The A/BRK has four modes:
- Three landing modes:
  - BTV mode (on dry and wet runways)
  - BTV CONTAM (on contaminated runways)
  - Basic autobrake (BRK MED)
- One RTO mode.

L2 Each mode provides a specific deceleration:
- The BTV targets a ground speed equal to 10 kt, approx. 60 m before the exit that the flight crew selected
- The BTV CONTAM provides a constant deceleration of 3 m/s^2 limited by A-SKID
- The BRK MED provides a constant deceleration of 3 m/s^2
- The RTO mode provides maximum braking performance limited by A-SKID.

L1 The flight crew arms the A/BRK via the A/BRK pb.
The BRAKES CTL automatically selects the appropriate autobrake mode depending on the aircraft on-ground or in-flight state, the selection of a BTV exit with the ANF and the selection of the LDG PERF CODE with the RWY CONDITION/BRAKING ACTION matrix.

Ident.: DSC-32-20-10-50-10-00012742.0001001 / 02 OCT 14

ARMING OF THE BASIC AUTOBRAKE MODE

The basic autobrake mode arms when:
- The flight crew presses the A/BRK pb
- The aircraft is in flight
- No BTV exit is selected
- Normal or alternate braking modes are available on all wheel groups.

L2 - Not more than one wheel per MLG has an A-SKID failure
L2 - At least one ADIRU is available (in NAV mode).
L3 The ADIRUs provide the autobrake with the current aircraft deceleration.

L1 Once armed, the Flight Mode Annunciator (FMA) displays BRK MED.

Ident.: DSC-32-20-10-50-10-00012743.0001001 / 28 APR 17

ACTIVATION OF THE BASIC AUTOBRAKE MODE

The basic autobrake mode activates when all of the following conditions occur:
- All the arming conditions are satisfied,
-
  - Immediately after ground spoilers extension if the NLG is on ground, or
  - 5 s after ground spoilers extension if the NLG is not on ground.

L2 For more information about the ground spoilers extension, *Refer to DSC-27-10-10 Ground Spoiler Control*.

L1 When the basic autobrake mode is active, the FMA displays BRK MED.

Ident.: DSC-32-20-10-50-10-00012744.0001001 / 03 JAN 20

DEACTIVATION OF THE BASIC AUTOBRAKE MODE

Once engaged, the basic autobrake mode deactivates/disengages and reverts to armed state if the ground spoilers are retracted and either the ground speed is at or above 72 kt, or at least one thrust lever is at or above MCT.

Once engaged, the basic autobrake mode deactivates/disengages and reverts to disarmed state if one of the following occurs:
- The autobrake is disarmed (refer to "DISARMING OF THE BASIC AUTOBRAKE MODE" below)
- The flight crew applies sufficient pedal deflection on one or both brake pedals
- The parking brake is activated
- The flight crew presses one of the A/THR instinctive disconnect pushbutttons.

DISARMING OF THE BASIC AUTOBRAKE MODE

The basic autobrake mode disarms if one of the following occurs:
- An autobrake landing mode arming condition is lost
- A system failure related to autobrake occurs (e.g BRAKES AUTO BRK FAULT alert, or BRAKES PART A-SKID FAULT),
- The flight crew presses the autobrake pushbutton in order to deselect the autobrake mode
- The ground spoilers are retracted, the aircraft speed is below 72 kt and both thrust levers are below MCT.

Note: *On ground, if the flight crew presses one time the A/THR instinctive disconnect pb, the autobrake disconnects. Immediately after, if the flight crew presses a second time the A/THR instinctive disconnect pb, the AUTO BRK OFF memo disappears and the corresponding audio indicator is not emitted.*

Ident.: DSC-32-20-10-50-10-00012745.0001001 / 02 OCT 14

ARMING OF THE RTO MODE

The autobrake RTO mode arms when:
- The flight crew presses the A/BRK pb
- The aircraft is on ground
- Normal or alternate braking modes are available on all wheel groups
- L2 Not more than one wheel per MLG has an A-SKID failure
- L3 The ground spoilers extension signal is available.

L1 Once the RTO mode is armed, The FMA displays BRK RTO.

Ident.: DSC-32-20-10-50-10-00012746.0001001 / 30 APR 14

ACTIVATION OF THE RTO MODE

The autobrake RTO mode activates when:
- All the arming conditions are satisfied
- The ground spoilers extend
- The aircraft ground speed is above 40 kt.

Once the RTO mode is activated, the FMA displays BRK RTO.

Ident.: DSC-32-20-10-50-10-00012747.0001001 / 03 JAN 20

DEACTIVATION OF THE RTO MODE

Once engaged, the autobrake RTO mode deactivates/disengages and reverts to armed state if the ground spoilers are retracted and at least one thrust reverser is at or above MCT.

Once engaged, the autobrake RTO mode deactivates/disengages and reverts to disarmed state if one of the following occurs:
- The RTO mode is disarmed (refer to "DISARMING OF THE RTO MODE" below)
- The ground spoilers are retracted and both thrust levers are below MCT
- The flight crew applies sufficient pedal deflection on one or both brake pedals
- The parking brake is activated.

DISARMING OF THE RTO MODE

The autobrake RTO mode disarms if one of the following occurs:
- A RTO mode arming condition is lost
- A system failure related to autobrake mode occurs (e.g BRAKES AUTO BRK FAULT alert, or BRAKES PART A-SKID FAULT),
- The flight crew presses the autobrake pushbutton in order to deselect the RTO mode
- The aircraft is in flight for more than 10 s
- The L/G lever is moved to the UP position.

Once the RTO mode is disarmed, the light of the A/BRK pb goes off.

Note: *On ground, if the flight crew presses the A/THR instinctive disconnect pb, immediately after autobrake disconnection, the AUTO BRK OFF memo disappears and the corresponding audio indicator is not emitted.*

Ident.: DSC-32-20-10-50-10-00012750.0001001 / 30 APR 14

For information about BTV, *Refer to DSC-34-32-30-10 Overview*.

ANTISKID

Applicable to: ALL

Ident.: DSC-32-20-10-50-20-00012748.0001001 / 13 JAN 15

The antiskid (A-SKID) prevents any wheel lock, to optimize the manual and automatic braking performance.

The A-SKID also:
- Limits tire wear
- Prevents tire bursts
- Provides aquaplaning protection.

For manual braking, the flight crew can achieve maximum braking performance by applying maximum deflection of the brake pedals.
For automatic braking, the aircraft can achieve maximum braking performance in RTO mode and ROP activation.
The flight crew can turn off the A-SKID from the A-SKID sw in the cockpit, without losing NWS.

CAUTION	The A-SKID disconnection with the A-SKID sw in the cockpit is permitted only in the case of “LOSS OF BRAKING” procedure (*Refer to procedure*).

A-SKID is not available:
- In alternate braking mode, if the accumulator pressure is less than 1 600 PSI (110 bar)
- In emergency braking mode
- In ultimate braking mode (parking brake).

Ident.: DSC-32-20-10-50-20-00012749.0001001 / 30 APR 14

L3 A-SKID PRINCIPLE

The A-SKID uses data from the ADIRS and the tachometers to calculate an individual target speed for each wheel. Each individual target speed ensures maximum braking performance in the current runway conditions, and changes as runway conditions change.
When the speed of a wheel decreases below the individual target speed, a brake release order is generated and combined with the braking orders of the flight crew or of the autobrake to maintain this target speed.

The resulting braking order is sent to:
- The Normal Servo Valve (NSV) of the wheel, when in normal braking
- The Alternate Servo Valves (ASV) of the pair of the affected wheel, when in alternate braking. The highest brake release order corresponds to the lowest speed of the wheel pair.

BRAKING PRE-LAND TEST (PLT)

Ident.: DSC-32-20-10-50-00024847.0001001 / 05 NOV 18
Applicable to: ALL

During the approach, 20 s after the landing gear is down and locked, the braking system tests all the braking modes in sequence. This is the braking Pre-Land Test (PLT).

L2 During the braking PLT, the braking system pressurizes the brakes and measures the actual braking pressure. If the braking PLT detects a failure, the braking system triggers the appropriate alert or dispatch message to inform the flight crew (e.g. BRAKES ALTN+EMER BRK FAULT).
As all the braking modes (normal, alternate, and emergency) are tested in sequence, the braking PLT may last approximately 2 min.

L1 The purpose of the braking PLT is to:
- Check that the braking system is configured in the appropriate mode for landing,
- Enable braking system reconfiguration if a failure is detected.

When the braking PLT is in progress, the WHEEL SD page displays all of the following:
- Variation of pressure on the pressure gauges,
- Variation in accumulator pressure indication until the braking system refills the braking accumulators.

If the aircraft touches down with the braking PLT in progress, the braking system automatically interrupts the PLT and depressurizes the brakes.

ACCU REINFLATE PB

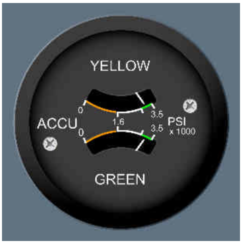
ACCU
REINFLATE

When pressed, the brake accumulators reinflate via the GREEN and YELLOW hydraulic systems. A single push on the ACCU REINFLATE pb is sufficient.

Note: *When one engine is running, the brake accumulators are automatically pressurized.*

Ident.: DSC-32-20-20-20-00012571.0001001 / 07 NOV 16

ACCUMULATOR PRESSURE INDICATOR



The accumulator pressure indicator displays the pressure of the green and yellow brake accumulators.

Amber arc	:	The amber range is from 0 to 1 600 PSI, and corresponds to the range at which the crew needs to reinflate the accumulators, as there is not enough pressure to use the parking brake or start the engines.
White arc	:	The zone from 1 600 to 2 600 PSI is white, and corresponds to a pressure sufficient to use the parking brake and start the engines, but not sufficient to perform engine tests.
Green arc	:	The Green range is from 2 600 to 3 500 PSI, and corresponds to the minimum pressure required to start a flight or perform engine tests.

Note: *Green and yellow brake accumulators are installed in different positions in the aircraft. As a consequence, depending on the temperature, a difference can be noticed between the pressure of the green and yellow brake accumulators.*

L2 For more information about the accumulator reinflation, *Refer to DSC-32-20-10-30 Accumulator Reinflation*.

PFD

Ident.: DSC-32-20-20-00002337.0001001 / 30 APR 14

BRAKING HYDRAULIC POWER SUPPLY

G

The normal braking is available on the associated wheel group, with the corresponding hydraulic power supply.

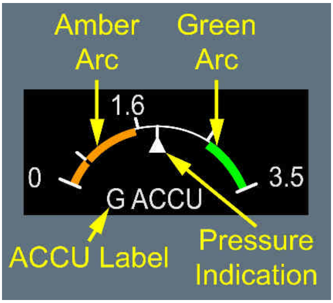
Y ACCU

The normal braking is failed on the associated wheel group, and the corresponding accumulator is available.

Y ACCU	The normal braking is failed on the associated wheel group, and the corresponding accumulator is not available (low pressure or fault).

Ident.: DSC-32-20-20-30-00002314.0001001 / 07 NOV 16

Y(G) ACCU PRESSURE INDICATIONS

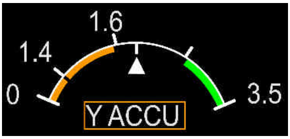


PRESSURE INDICATION

The pressure indication indicates the brake accumulator pressure, from 0 to 3 500 PSI.

Note: *Green and yellow brake accumulators are installed in different positions in the aircraft. As a consequence, depending on the temperature, a difference can be noticed between the pressure of the green and yellow brake accumulators.*

In normal operation, the "0", "1.6", and "3.5" values are displayed on the ACCU pressure indiction.
If the normal braking mode is lost on a wheel group, the "1.4" value is also displayed on the associated accumulator pressure indication.



When the pressure indication is:
- Above 1.6: The alternate braking mode is available with A-SKID
- Between 1.4 and 1.6: The alternate braking mode or emergency braking mode is available without A-SKID
- Below 1.4: All braking modes are lost.

GREEN ARC

The green arc represents the normal pressure zone.
The green arc goes from 2 600 to 3 500 PSI.

AMBER ARC

The amber arc represents the low pressure zone.
The amber arc goes from 0 to 1 600 PSI.

ACCU LABEL

G ACCU	The associated accumulator operates normally.
G ACCU	The associated accumulator is failed.

Ident.: DSC-32-20-20-30-00018106.0001001 / 30 APR 14

BRAKING MODE INDICATIONS

NORM	The associated braking mode is available and active.
EMER	The associated braking mode is available.

L12

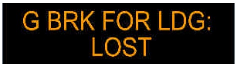
ALTN	The associated braking mode is failed. Associated with one of the following ECAM alerts: - BRAKES PART NORM BRK FAULT (*Refer to procedure*), or - BRAKES PART ALTN BRK FAULT (*Refer to procedure*).

Ident.: DSC-32-20-20-30-00018107.0001001 / 30 APR 14

BRAKING LOSS FORECAST

Y A-SKID FOR LDG: AVAIL	The associated antiskid function is available.
G A-SKID FOR LDG: LOSS IN 2^{H} 30’	The associated antiskid function will be lost in 2 h 30 min.
Y BRK FOR LDG: LOSS IN 2^{H} 20’	The associated braking function will be lost in 2 h 20 min.
G BRK FOR LDG: LOSS > 9^{H} 00’	The associated braking function is available for more than 9 h.
Y BRK FOR LDG: LOSS < 0^{H} 30’	The associated braking function will be lost in less than 30 min.

L12



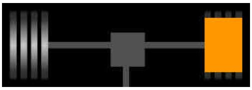
G BRK FOR LDG:
LOST

The associated braking function is lost.
Associated with the following ECAM alert: BRAKES G(Y) ACCU REINFLATE FAULT (*Refer to procedure*).

Ident.: DSC-32-20-20-30-00002315.0001001 / 30 APR 14

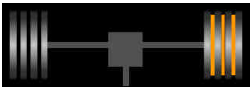
BRAKES STATUS INDICATION

L12



Residual braking affects the associated brake.
Associated with the following ECAM alert: BRAKES RESIDUAL BRAKING (*Refer to procedure*).

L12



The associated brake is released.
Associated with the following ECAM alert: BRAKES RELEASED (*Refer to procedure*).

Intentionally left blank

ERRONEOUS BRAKES AFT(FWD) WHEELS BRK LOST AFTER LANDING GEAR RETRACTION

Ident.: DSC-32-20-25-00025349.0001001 / 28 MAY 20
Applicable to: ALL

1 DESCRIPTION

In both of the following cases, at least one of the BRAKES AFT WHEELS BRK LOST or the BRAKES FWD WHEELS BRK LOST ECAM alert may appear:

- Some failure modes of the landing gear lever may cause the Brake Control System (BCS) to consider the landing gear lever in an erroneous position. When the flight crew moves the landing gear lever to the up position, the landing gear will move to the up position. However, the monitoring part of the BCS may still consider it in the down position. This situation may delay the application of the brakes during the retraction braking sequence and cause erroneous ECAM alerts,
- After lift-off, the BRAKES HOT ECAM alert can appear if the temperature of one of the brakes reaches 300 °C. In this case, the flight crew has to select the L/G lever DOWN for cooling. However, if the flight crew selects the L/G lever UP, as required by SOP, and then applies ECAM action before the landing gear uplock, this can cause erroneous ECAM alerts.

2 OPERATIONAL RECOMMENDATIONS

If one of the following condition is applicable:

- L/G CTL 1 or L/G CTL 2 appears after takeoff (above the takeoff line) on the DISPATCH page,
- After lift-off, following the BRAKES HOT ECAM alert, the flight crew selects the L/G lever UP and then selects the L/G lever DOWN, as per ECAM action, before the landing gear uplock.

Disregard the BRAKES AFT WHEELS BRK LOST ECAM alert or the BRAKES FWD WHEELS BRK LOST ECAM alert.

DISCREPANCY BETWEEN WHEEL SD page AND ECAM ALERTS - A-SKID INDICATION

Ident.: DSC-32-20-25-00022164.0001001 / 04 DEC 14
Applicable to: ALL

DESCRIPTION

On the WHEEL SD page, A-SKID indication is displayed instead of A-SKID between wheels pairs following total loss of braking on the affected wheel group.

However the following alert and indications remain correct:
- The BRAKES AFT(FWD) WHEELS BRK LOST or BRAKES PART A-SKID FAULT alert on the WD, and
- The associated braking modes on the WHEEL SD page, and
- The A-SKID status in the INOP SYS section of the SD STATUS page.

PROCEDURE

On the WHEEL SD page: Disregard the A-SKID indication of the affected wheel group.

ERRONEOUS INDICATION OF TIME TO A/SKID LOSS DURING CLIMB AND FIRST HOUR OF CRUISE

Ident.: DSC-32-20-25-00022170.0001001 / 04 DEC 14
Applicable to: ALL

DESCRIPTION

On the WHEEL SD page, a time indication for the loss of the A-SKID is displayed in the case of hydraulic failure. This time indication may be erroneous (underestimated) during initial climb up to the first hour of cruise.

PROCEDURE

On the WHEEL SD page:
Disregard "TIME TO A-SKID LOSS INFO" during initial climb and the first hour of cruise.

DISCREPANCY BETWEEN WHEEL SD PAGE AND ECAM ALERTS - RELEASED INDICATION

Ident.: DSC-32-20-25-00024295.0001001 / 29 MAY 17
Applicable to: ALL

DESCRIPTION

On the WHEEL SD page, the released amber indication is not displayed for the affected wheel when the BRAKES RELEASED [BRK XX RELEASED] alert is displayed and BRAKES CTL 1 and BRAKES CTL 2 are not available.

However, the following alerts and indication remain correct:
- The BRAKES RELEASED [BRK XX RELEASED] alert on the WD that indicates the failure of a brake,
- The BRAKES AUTO BRK FAULT alert on the WD that indicates the failure of the BRAKES CTL 1 and BRAKES CTL 2,
- The AUTO BRK amber indication on the WHEEL SD page.

PROCEDURE

On the WHEEL SD page, disregard the normal indication for the wheel that is released. The flight crew must compute the impact on landing performance in accordance with the alerts displayed on the WD and the information available on the STATUS page.

LOW LEVEL OF RESIDUAL BRAKING PRESSURE AFTER PARKING BRAKE RELEASE

Ident.: DSC-32-20-25-00024420.0001001 / 26 OCT 17
Applicable to: ALL

DESCRIPTION

At parking brake release, a small amount of hydraulic fluid could remain temporarily trapped in some wheels due to the behavior of the Alternate Servo Valves (ASVs) in the alternate braking hydraulic circuit.
This low level of residual braking pressure is not felt by the crew during taxi or takeoff roll.
When it occurs, this low level of residual pressure trapped in the brakes can be detected by the crew via pressure indicated on the brake pressure gauges on the WHEEL SD page.

PROCEDURE

In order to remove this residual braking pressure from the brakes, the flight crew should press the brake pedals for parking brake release.
This permits to evacuate the hydraulic fluid via the normal braking circuit that brake pedals control.

Intentionally left blank

OVERVIEW

Ident.: DSC-32-30-10-00012904.0001001 / 06 AUG 14
Applicable to: ALL

The Nose Wheel Steering (NWS) system enables directional control of the aircraft on ground.

The flight crew can steer the aircraft using:
- The rudder pedals, or
- The steering handwheels (tillers).

The autopilot can also generate steering commands during an automatic landing.

ARCHITECTURE

Applicable to: ALL

Ident.: DSC-32-30-10-10-00012905.0001001 / 30 APR 14

NWS HYDRAULIC POWER SUPPLY

The YELLOW hydraulic system powers the NWS.

L2 The YELLOW hydraulic system supplies the NWS only when at least one engine is running.

Ident.: DSC-32-30-10-10-00012907.0001001 / 30 APR 14

NWS ACTUATORS

Two hydraulic NWS actuators, attached on the front of the NLG, generate the rotational movement of the NLG wheels.

Ident.: DSC-32-30-10-10-00012908.0001001 / 30 APR 14

L2 NOSE ISOLATION VALVE

The Nose Isolation Valve (NIV) opens when the normal NWS is active.
If the NWS fails, the NIV closes automatically to isolate the NWS from the yellow hydraulic pressure.

Ident.: DSC-32-30-10-10-00012909.0001001 / 30 APR 14

L2 NWS SERVO VALVE

The NWS servo valve regulates the hydraulic flow that is supplied to the steering actuators in accordance with the flight crew steering commands or the autopilot (AP) commands.

Ident.: DSC-32-30-10-10-00012910.0001001 / 30 APR 14

STEERING CONTROL (STEER CTL)

The STEER CTL controls the Nose Wheel Steering (NWS).
The STEER CTL has two redundant control systems referred to as STEER CTL 1 and STEER CTL 2.
One STEER CTL side is active at a time, while the other is on standby.
L2 At landing gear extension, the standby STEER CTL side becomes active.

L3 Both STEER CTL are commanded by the Wheel Steering Control System (WSCS) applications hosted by the CPIOMs :
- WSCS 1 is hosted in CPIOM-H61 and CPIOM-H63
- WSCS 2 is hosted in CPIOM-H62 and CPIOM-H64.

L1 Each STEER CTL receives electrical demand from:
- The steering handwheels (tillers)
- The rudder pedals

  L2 The commands from the rudder pedals are initially sent via the primary flight control computer (PRIMs). If the rudder pedal signals from PRIMs are lost or invalid, rudder pedals orders are acquired from the secondary flight control computer (SEC)
- L1 The autopilot during automatic landings

  L2 The commands of the autopilot are also initially sent to the PRIMs
- L1 The Steering Disconnect Panel (SDP).

Then, the active STEER CTL computes and sends electrical commands to the hydraulic equipment of the steering system.

L2 The STEER CTL commands the NIV in open position to provide hydraulic power.
The STEER CTL commands the NWS actuators via the NWS Servo Valve (NWSSV).
A feedback of the NLG position is ensured by two rotary position sensors.

L1 The STEER CTL also sends data to the FWS and the CDS to generate alerts and displays the WHEEL SD page.
During taxi, the active STEER CTL compensates for NWS offset and crosswind with the Heading Control Function (HCF).

Ident.: DSC-32-30-10-10-00012911.0001001 / 30 APR 14

NLG ROTARY POSITION SENSOR

L2 Two rotary position sensors provide the STEER CTL with feedback on the NLG position.

Ident.: DSC-32-30-10-10-00012915.0001001 / 30 APR 14

L2 INTERFACE WITH OTHER SYSTEMS

The Steering System interfaces with the following systems:
- Hydraulic system (HYD)
- Electrical system (ELEC)
- Air Data/Inertial Reference System (ADIRS)
- PRIM and SEC
- Brakes Control system (BRAKES CTL)
- Landing Gear Extension and Retraction System (LGERS)
- Control and Display System (CDS)
- Flight Warning System (FWS)
- Propulsion Control System (PCS)
- The Digital Flight Data Recorder (DFDR)
- Aircraft Condition Monitoring System (ACMS)
- Central Maintenance System (CMS)

NWS OPERATION

Ident.: DSC-32-30-10-00012912.0001001 / 30 APR 14
Applicable to: ALL

L2 The NWS is not available when the engines are shut down.

L1 The NWS angle is a function of:
- The position of the steering handwheel that is used by the flight crew, or
- The deflection of the rudder pedals

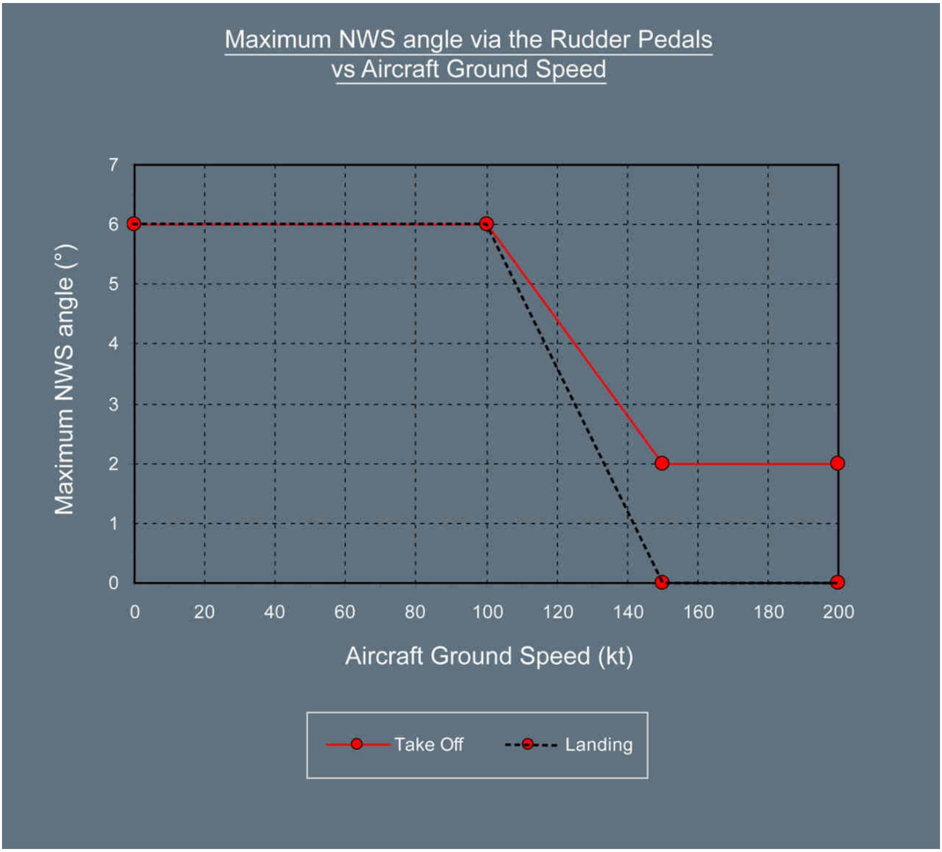
L2 The rudder pedals of the Captain (CAPT) and the First Officer (F/O) are mechanically linked.

L1 - The ground speed of the aircraft in accordance with the flight phase (taxi, takeoff or landing).

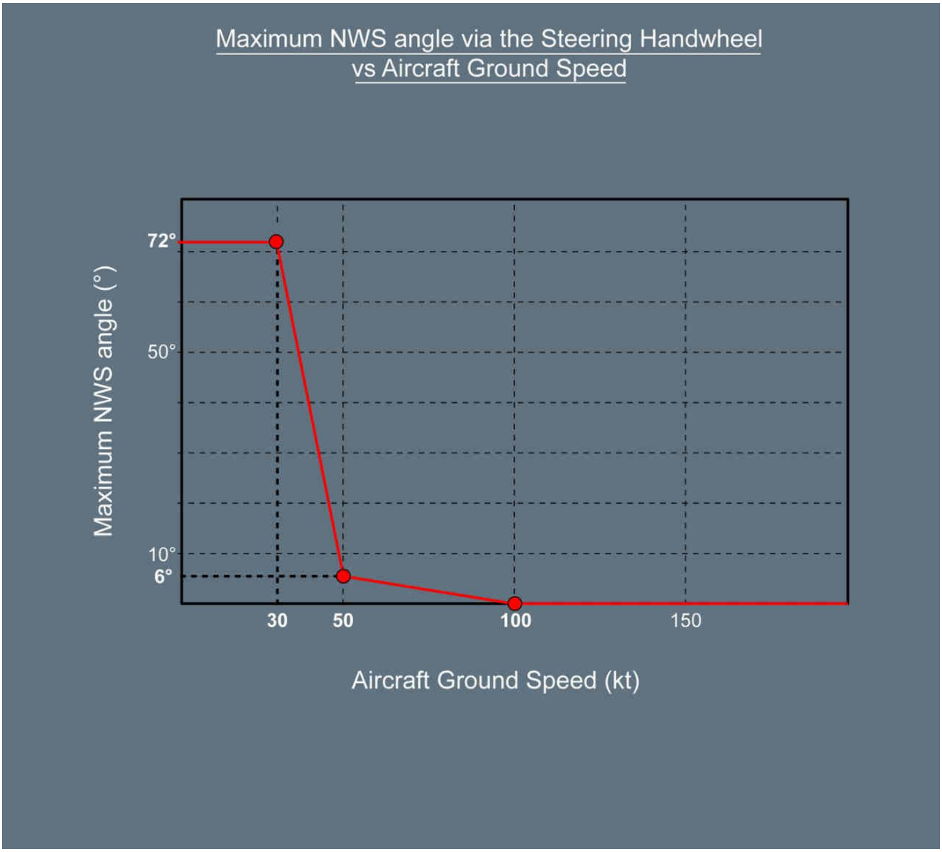
Note: *If both steering handwheels are used simultaneously, the steering commands are algebraically added.*

The maximum NWS angle is:

- 6 ° left or right, via the rudder pedals below 100 kt and is reduced above 100 kt.



- 72 ° left or right via the steering handwheels below 30 kt and is reduced above 30 kt.



HEADING CONTROL FUNCTION

Ident.: DSC-32-30-10-00014043.0001001 / 30 APR 14
Applicable to: ALL

The Heading Control Function (HCF) aims to mitigate aircraft veering during taxi (speed below 50 kt), by maintaining the aircraft in straight line when the flight crew releases the steering handwheel. The HCF compensates for the external perturbations (NWS offset, crosswind, taxiway slope).

L2 At takeoff and landing, the HCF is inhibited.

L3 The HCF can order a maximum of +/- 3 ° of nosewheel steering.

L1 Note: *If the HCF is inoperative or disconnected via the PEDAL DISC pb, the pilot has to compensate for the offset with the steering handwheel.*

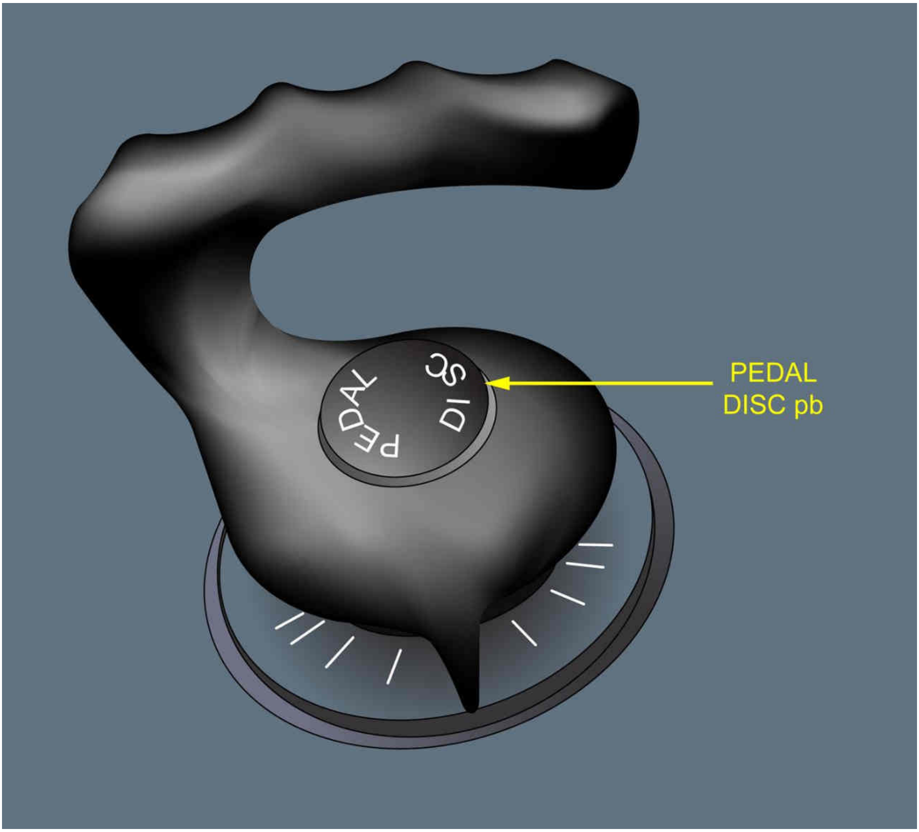
STEERING HANDWHEEL

Applicable to: ALL

Ident.: DSC-32-30-20-10-00012921.0002001 / 03 JAN 20



The flight crew uses the steering handwheels to steer the aircraft during taxi.
Each steering handwheel controls the NWS angle up to 72 ° left or right.
The following table provides the nose wheel steering angle corresponding to the handwheel graduations, for an aircraft speed lower than 30 kt. *Refer to DSC-32-30-10 NWS Operation*.

Handwheel Graduation	Nose Wheel Steering Angle
1	0 °
2	6.4 °

Continued on the following page

Continued from the previous page

3	23.3 °
4	48.1 °
5	68.4 °

Ident.: DSC-32-30-20-10-00012922.0001001 / 30 APR 14

PEDAL DISC PB

When pressed and held, the PEDAL DISC pb disconnects:
- The NWS from the rudder pedals
- The Heading Control Function (HCF).

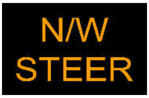
N/W STEER INDICATION

L12



The nose wheel steering is failed.
Associated with the following ECAM alert: STEER N/W STEER FAULT (*Refer to procedure*).

Intentionally left blank

TOWING

Ident.: DSC-32-30-30-00012913.0001001 / 30 APR 14
Applicable to: ALL

When the aircraft is towed, the ground crew must set the NWS Disconnect sw of the Steering Disconnect Panel (SDP) in the towing position. The towing position enables the NLG to be free to swivel and prevent damages to the structure due to unwanted NWS activation if an engine is started.

L2 For more information about the SDP, *Refer to DSC-32-30-20 Steering Disconnect Panel*.

Intentionally left blank

BACKUP STEERING FUNCTION

Applicable to: ALL

Ident.: DSC-32-30-40-10-00012914.0001001 / 24 MAY 17

The Backup Steering Function (BSF) permits the flight crew to steer the aircraft when:

- The Nose Wheel Steering (NWS) is failed and the nose wheel is free to swivel, or
- The yellow hydraulic circuit is lost.

The BSF permits to vacate the runway using the normal steering controls (i.e. steering handwheels and rudder pedals).

L2 The maximum NWS angle remains the same as in normal operation with the nose wheel steering system operative.

L1 The PRIMs and the STEER CTL convert steering control inputs into differential braking orders applied on the MLG wheels powered by the GREEN hydraulic system.

BSF ACTIVATION

The BSF is active:

- When one of the following failure occurs:
  - The NWS is inoperative and the nose wheel is free to swivel (for more information, *Refer to procedure*), or
  - The yellow hydraulic circuit is lost (for more information, *Refer to procedure*),
- After landing,
- When the autopilot (AP) and the autobrake (A/BRK) are disconnected,
- When the aircraft speed is at or below 30 kt.

The BSF does not activate:
- During taxi out, or
- After a Rejected Takeoff (RTO), or
- When one engine is inoperative, or
- When one or more green brakes are not available in normal braking mode, or
- When the nose wheel is not free to swivel.

The STEER N/W STEER FAULT and the HYD Y SYS PRESS LO alerts indicate to the flight crew when the BSF is active or inhibited.

Intentionally left blank

OVERVIEW

Ident.: DSC-32-40-10-00012631.0002001 / 09 MAR 16
Applicable to: ALL

The Landing Gear Monitoring System (LGMS) includes:
- The Brake Temperature Monitoring System (BTMS)
- The Brake Fan ◁
- The Tire Pressure Indicating System (TPIS).

BRAKE TEMPERATURE MONITORING

Ident.: DSC-32-40-10-00012917.0001001 / 30 APR 14
Applicable to: ALL

The Brake Temperature Monitoring System (BTMS) of the LGMS measures the temperature of each brake and sends it to:

- The ECAM to generate the BRAKES BRAKES HOT alert (*Refer to procedure*), when a brake temperature exceeds 300 °C, and to the WHEEL SD page (*Refer to WHEEL SD - LGMS Indication)*
- L2 The Central Maintenance System (CMS) to trigger maintenance messages when a brake temperature exceeds 800 °C.

The BTMS displays measured temperatures from 0 °C to 995 °C by step of 5 °C.
L1 The brake temperature values are sent to the LGMS 1 and LGMS 2.

BRAKE FANS

Ident.: DSC-32-40-10-00012918.0004001 / 09 MAR 16
Applicable to: ALL

To improve aircraft turnaround time, brake fans can be used to cool down the brakes quicker than natural conduction and radiation.
The flight crew sets the brake fans to ON by pressing the BRAKE FAN pb.
L2 The brake fans are automatically set to off at takeoff when the engines thrust increase and the BCF power supply frequency is more than 525 Hz.

TIRE PRESSURE INDICATING SYSTEM (TPIS)

Ident.: DSC-32-40-10-00002291.0001001 / 30 APR 14
Applicable to: ALL

The Tire Pressure Indicating System (TPIS) measures the pressure of each tire. This information is sent to the ECAM to generate the WHEEL TIRE PRESS LO alert (*Refer to procedure*), and to the WHEEL SD page (*Refer to WHEEL SD page - Tire Pressure Indication*).
L3 The TPIS can measure pressures from 0 to 480 PSI by step of 1 PSI.
L1 The tire pressure values are sent to the LGMS 1 and LGMS 2.

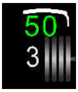
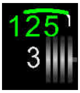
BRAKE TEMPERATURE INDICATION



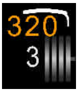
The brake temperature is normal.

L12

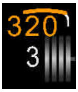


The brake temperature is normal. The green arc indicates the hottest wheel brake. The green arc appears only if the hottest brake temperature exceeds 100 °C.

L12



The brake temperature is excessive.
The brake temperature exceeds 300 °C.
Associated with the following ECAM alert: BRAKES BRAKES HOT (*Refer to procedure*).



The brake temperature is excessive. The amber arc indicates the hottest wheel brake.

Ident.: DSC-32-40-20-10-00012929.0001001 / 30 APR 14

TIRE PRESSURE INDICATION

The tire pressure is normal.

- The tire pressure is low, or

  The tire pressure is low if it reaches the following percentage of the nominal pressure:
  - 89 % before liftoff
  - 74 % after liftoff.
- The difference of pressure between the two tires of the same axle is excessive.

  The difference of pressure between the two tires is excessive if it reaches the following percentage:
  - 15 % before liftoff
  - 21 % after liftoff.

Associated with the following ECAM alert: WHEEL TIRE PRESS LO (*Refer to procedure*).

The cockpit lights provide the flight crew with the best lighting environment to perform their duties.

L2 The cockpit lights enable the flight crew:
- To move safely in the cockpit
- To see the cockpit equipment
- To use the work surfaces in an appropriate way.

L1 The flight crew can dim most of the cockpit lights, if necessary.

L2 The flight crew cannot dim the following cockpit lights:
- The pedals lights
- The coat stowage lights
- The ice indicator, the standby compass, and the eye reference lights.

L1 The cockpit has lights of two different colors:
- Lights with an orangey white color that do not strain the human eye.

L2 The following lights are an orangey white color:
  - The dome lights
  - The integral lights
  - The pedestal lights
  - The main instrument panel lights
  - The pedals lights
  - The console lights
  - The coat stowage lights
  - The standby compass, the ice indicator, and the eye reference lights
  - The annunciator lights.

L1 - Lights with a bluish white color that help the flight crew to read.

L2 The following lights are a bluish white color:
  - The sliding table lights
  - The map lights
  - The reading lights.

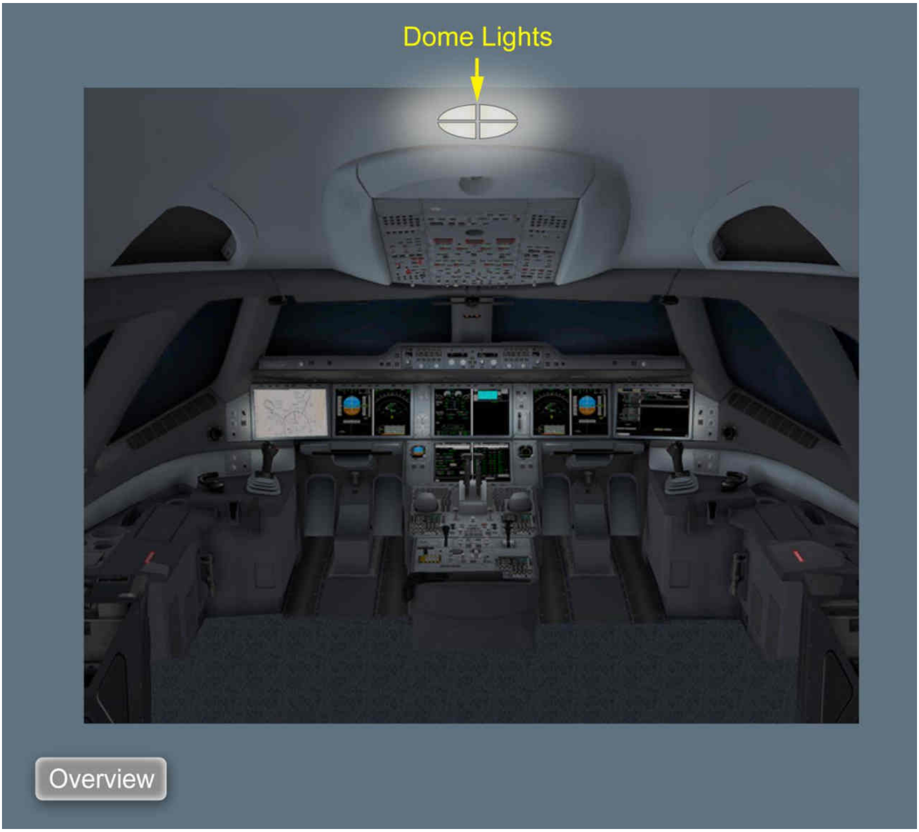
DOME LIGHTS

Ident.: DSC-33-20-10-00013592.0001001 / 29 APR 14
Applicable to: ALL

The cockpit has two dome lights behind the overhead panel that provide lighting in the cockpit.

Dome Lights



L2 When the ground servicing supplies the aircraft with electricity, the right side dome light is available.

INTEGRAL LIGHTS

Ident.: DSC-33-20-10-00013593.0001001 / 29 APR 14
Applicable to: ALL

The cockpit has integral lights on:
- The main instrument panel
- The pedestal

- The overhead panel
- The glareshield.

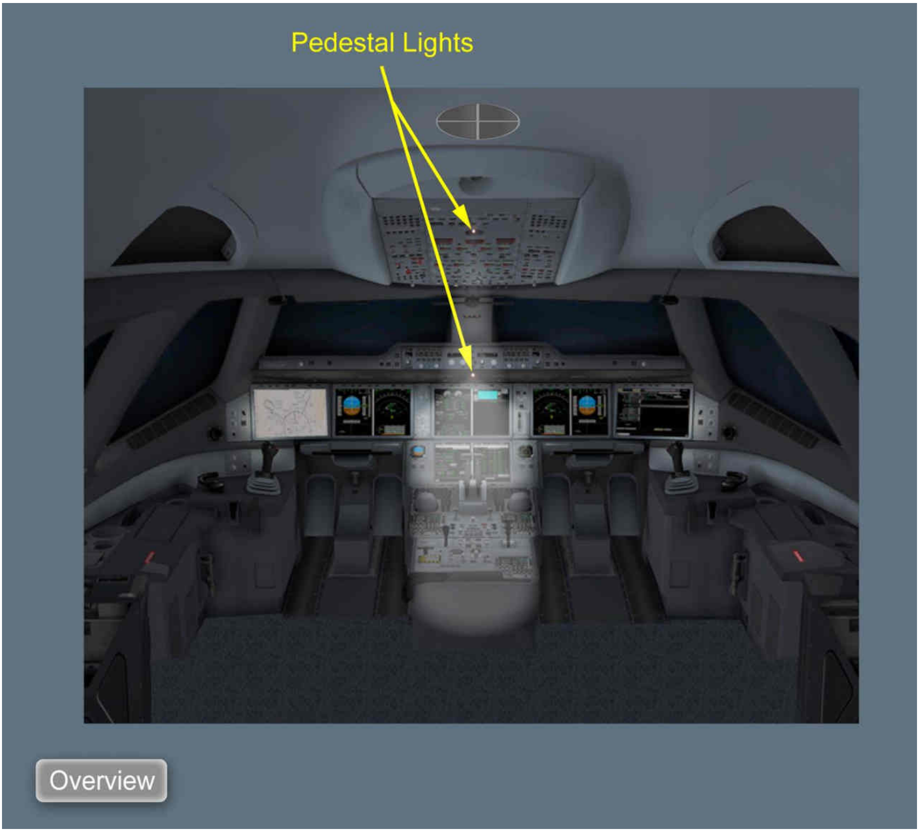
PEDESTAL LIGHTS

Ident.: DSC-33-20-10-00013594.0001001 / 29 APR 14
Applicable to: ALL

The cockpit has one light on the overhead panel and another light under the glareshield. These lights provide lighting on and in front of the pedestal.

L2 The flight crew can adjust the brightness of the pedestal lights via the FLOOD LT knob.

Pedestal Lights



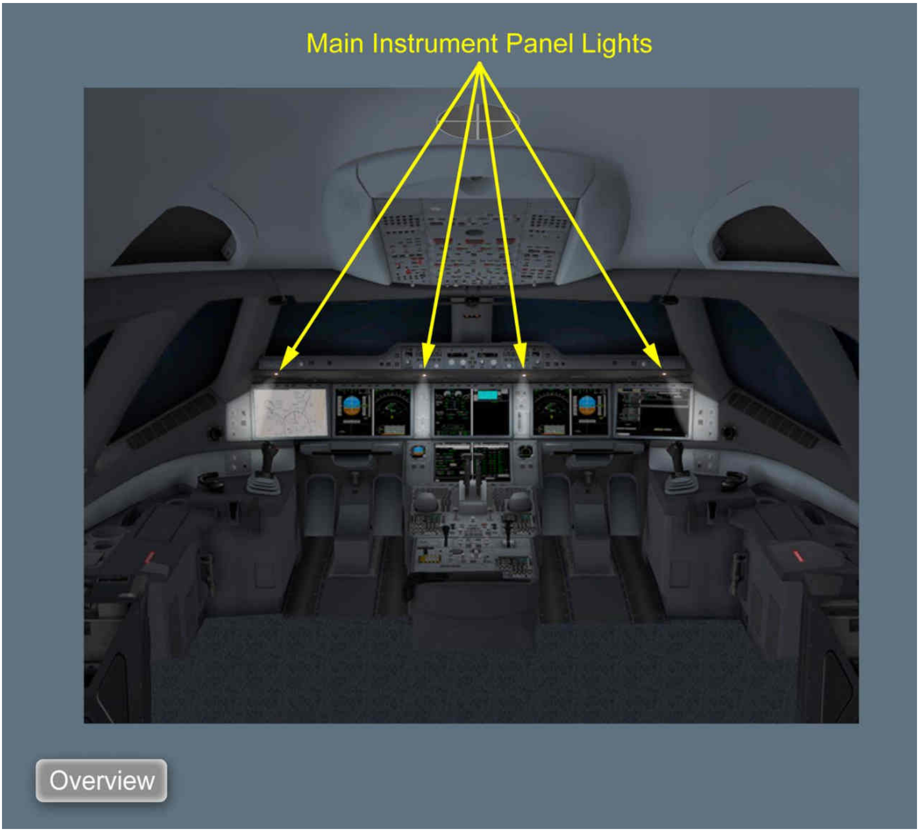
MAIN INSTRUMENT PANEL LIGHTS

Ident.: DSC-33-20-10-00013595.0001001 / 29 APR 14
Applicable to: ALL

The cockpit has four lights under the glareshield that provide lighting on the controls of the main instrument panel.

L2 The flight crew can adjust the brightness of the main instrument panel lights via the FLOOD LT knob.

Main Instrument Panel Lights



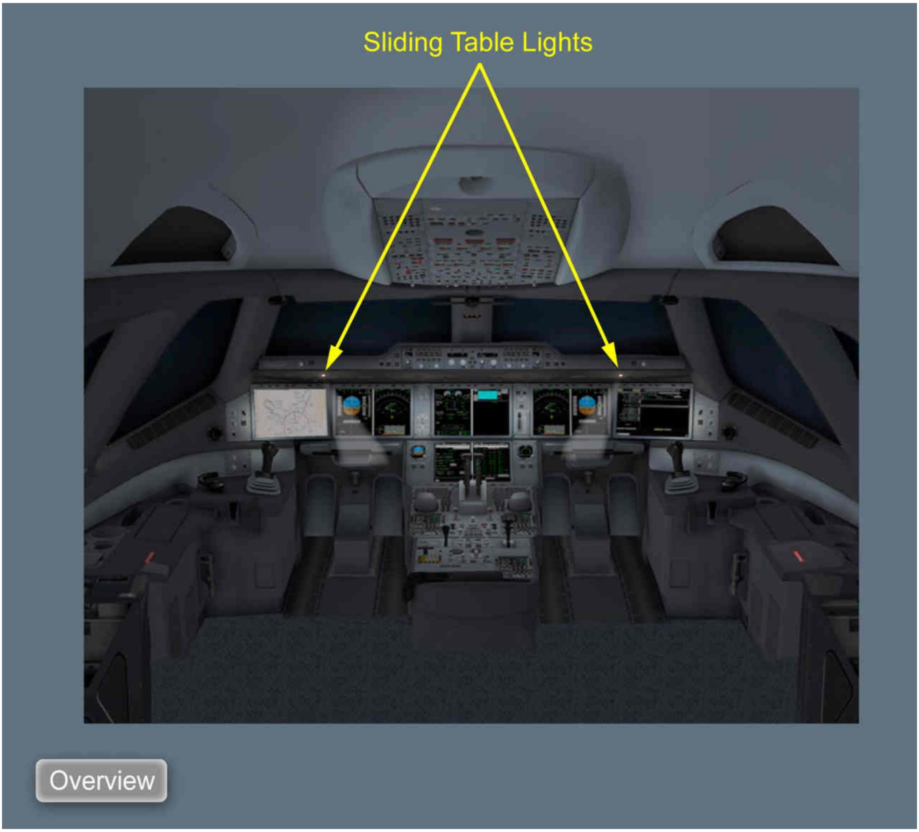
SLIDING TABLE LIGHTS

Ident.: DSC-33-20-10-00013596.0001001 / 29 APR 14

Applicable to: ALL

The cockpit has two lights under the glareshield. These lights provide lighting on the sliding tables of the CAPT and the F/O.

Sliding Table Lights



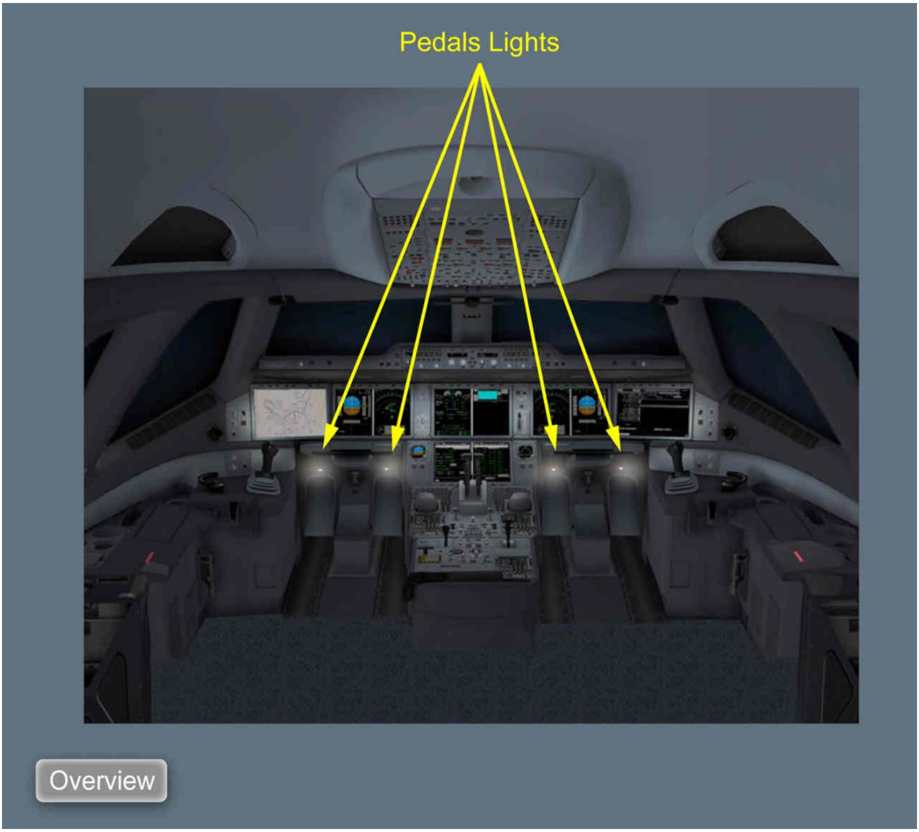
PEDALS LIGHTS

Ident.: DSC-33-20-10-00013597.0001001 / 29 APR 14
Applicable to: ALL

The cockpit has four lights behind the rudder pedals:
- Two lights on the CAPT side
- Two lights on the F/O side.

These lights provide lighting on the rudder pedals.

Pedals Lights



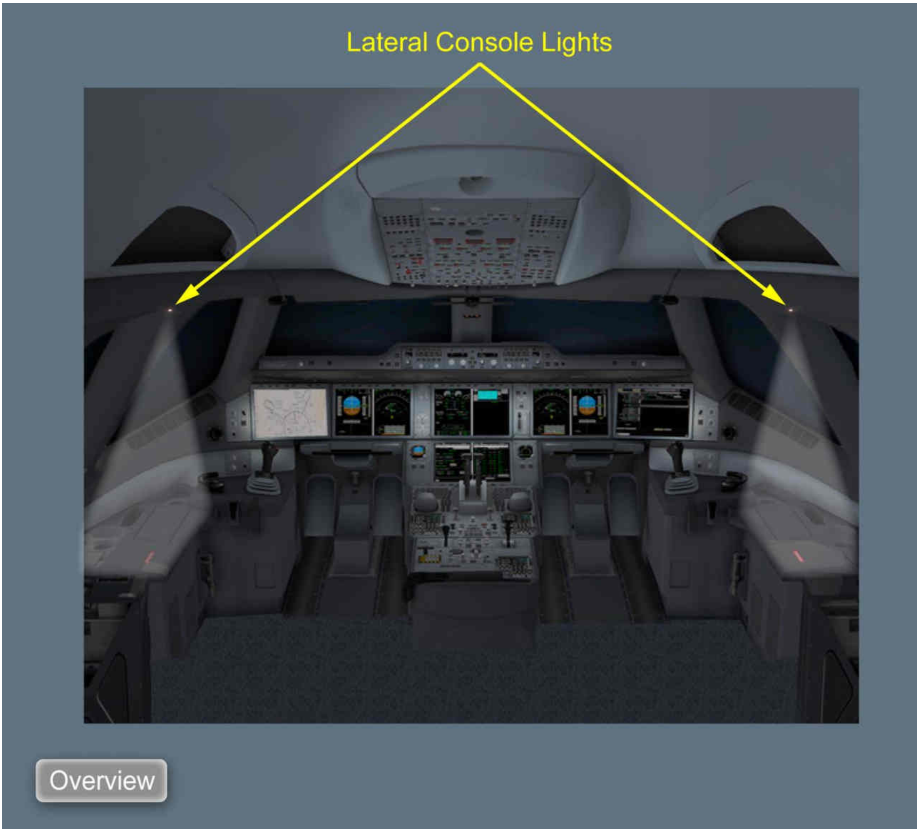
LATERAL CONSOLE LIGHTS

Ident.: DSC-33-20-10-00013598.0001001 / 29 APR 14
Applicable to: ALL

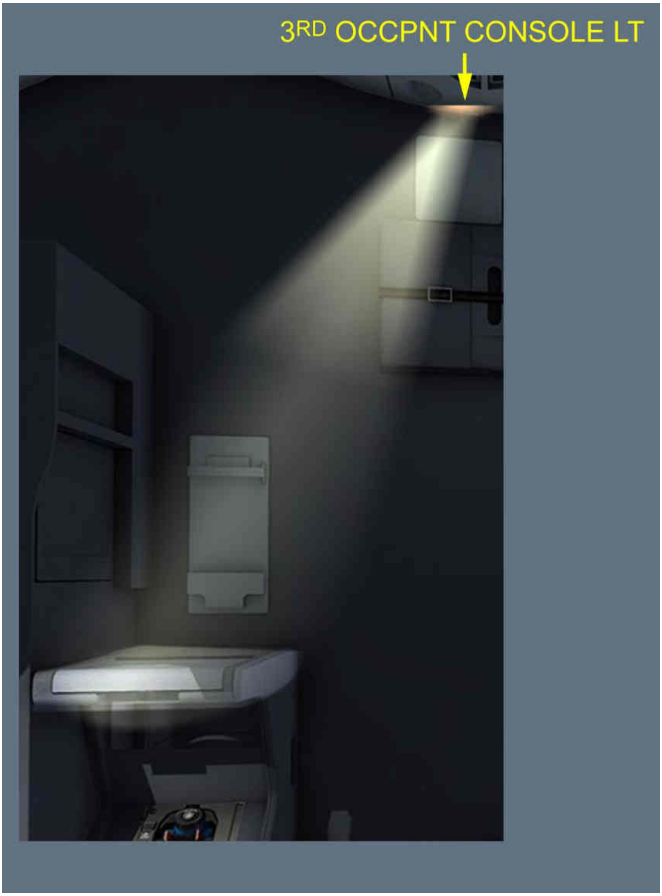
The cockpit has three lights that provide lighting on the lateral console area of the CAPT, the F/O, and the third occupant. These lights are:

- One above the space between the lateral and the aft windows of the CAPT side
- One above the space between the lateral and the aft windows of the F/O side
- One behind the overhead panel.

Lateral Console Lights



Lateral Console Light of the Third Occupant



MAP HOLDER LIGHTS

Ident.: DSC-33-20-10-00013599.0001001 / 29 APR 14

OVERVIEW

Ident.: DSC-33-30-10-00002460.0001001 / 09 MAR 16
Applicable to: ALL

The exterior lights:
- Increase the visibility around the aircraft during operations and improve the flight crew's awareness
- Enable the identification of the aircraft and its position.

The exterior lights are:
- The navigation lights
- The landing lights
- The takeoff lights
- The taxi and the runway turn off lights
- The taxi camera lights ◁
- The logo lights
- The anti-collision lights:
  - The strobe lights
  - The beacon lights
- The wing and engine scan lights.

The Exterior Lights Controller (ELCO) control and monitor the exterior lights.
L3 Two redundant ELCOs are hosted in the CPIOMs J71 and J72.

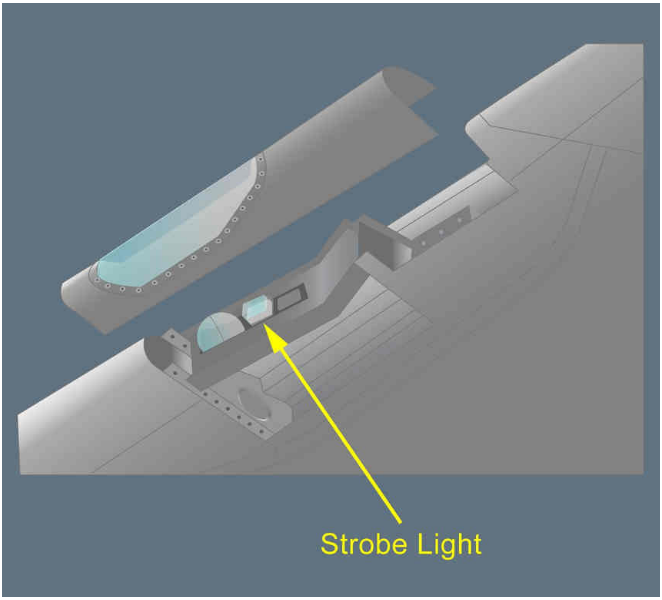
STROBE LIGHTS

Ident.: DSC-33-30-10-00013580.0002001 / 05 NOV 18
Applicable to: ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB

The aircraft has three anti-collision strobe lights:

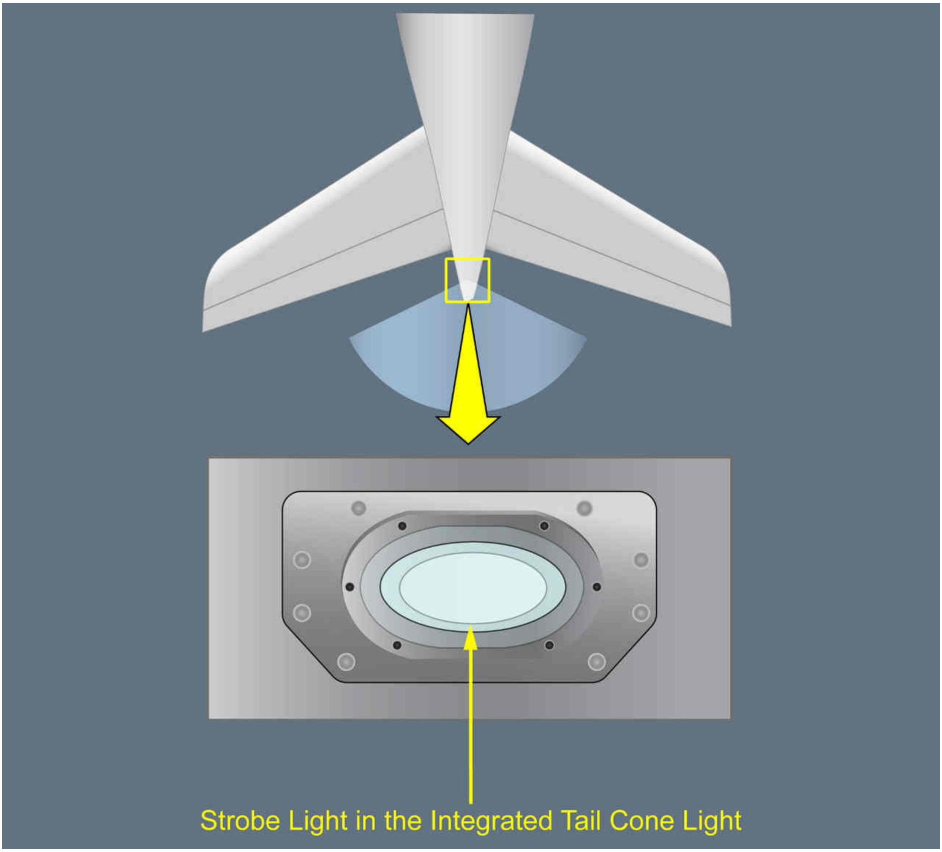
- One strobe light on each wingtip

Wingtip Strobe Light



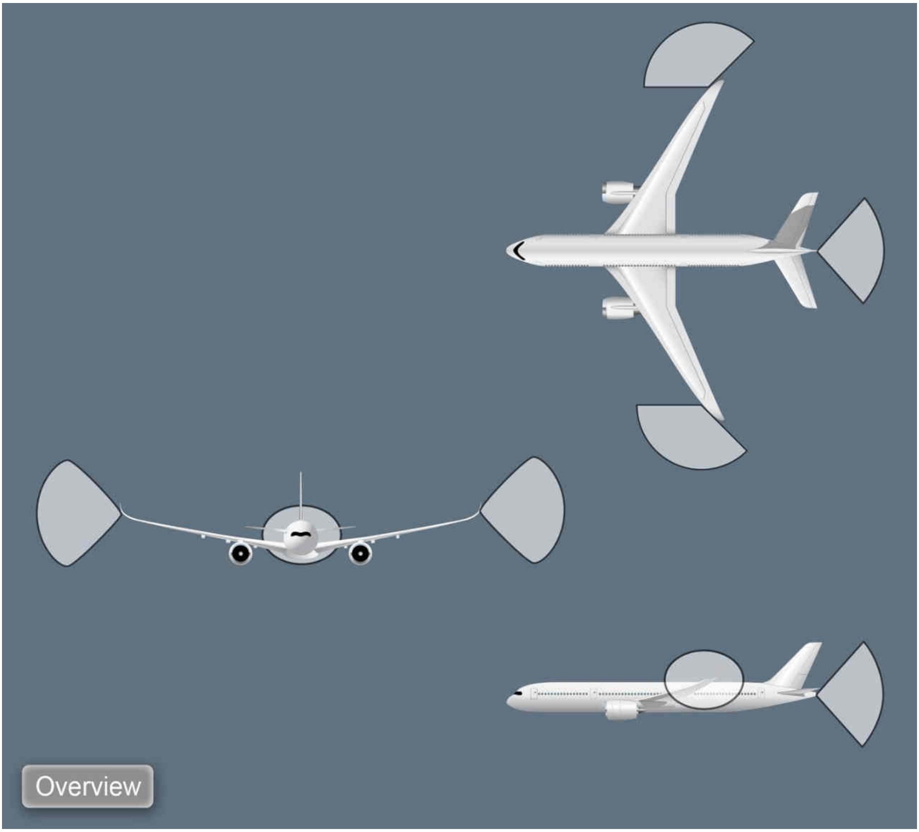
- One strobe light in the integrated tail cone light below the APU exhaust.

Tail Cone Strobe Light



Strobe Light in the Integrated Tail Cone Light

Strobe Lights



The strobe lights, as anti-collision lights, provide a white flashing light with high brightness.

STROBE LIGHTS

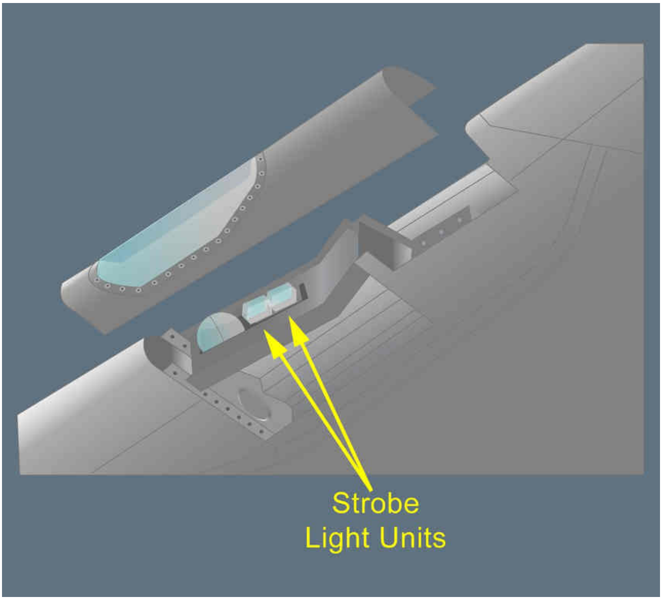
Ident.: DSC-33-30-10-00013580.0001001 / 27 JUN 17

Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD

The aircraft has three anti-collision strobe lights:

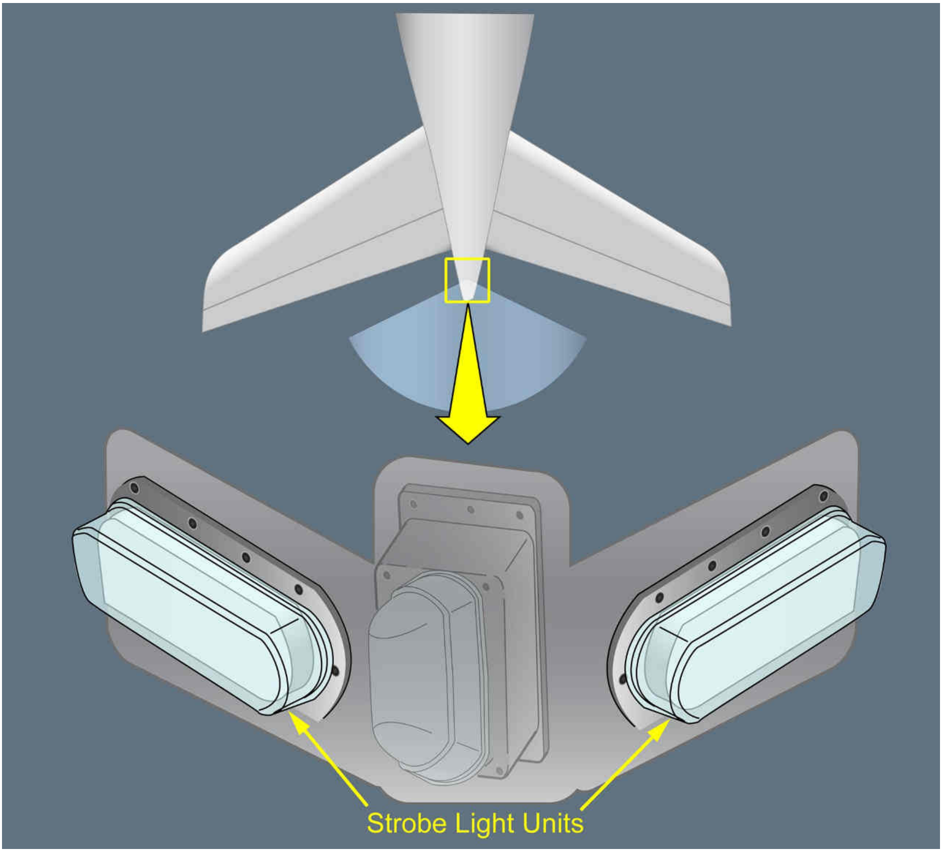
- One strobe light on each wingtip

Wingtip Strobe Light



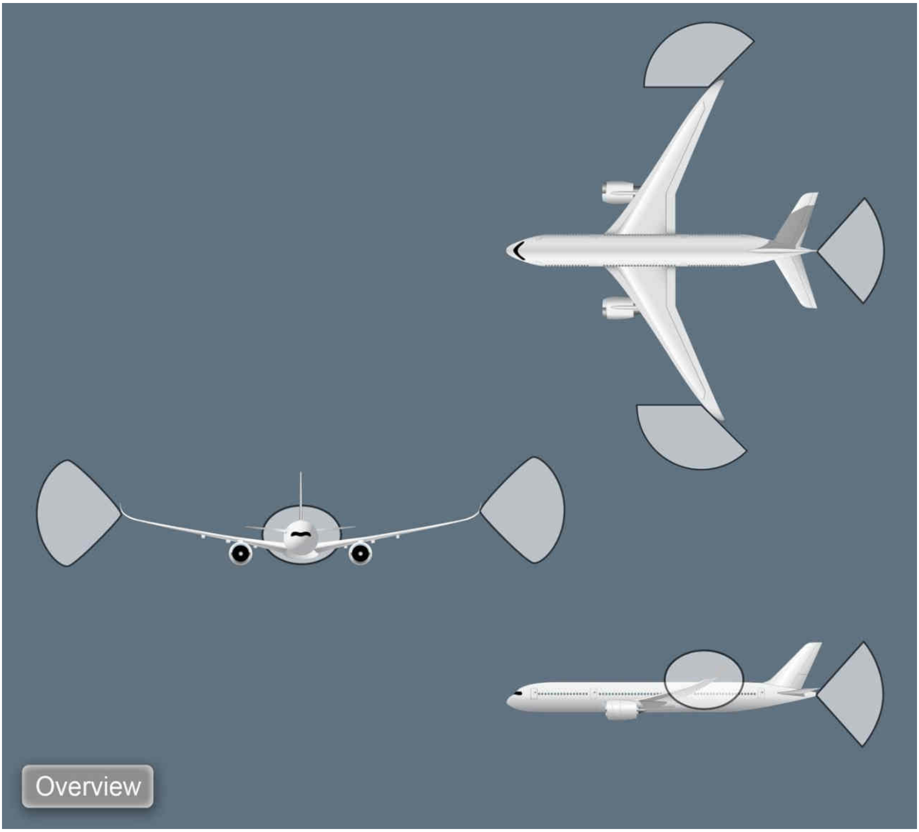
- One strobe light on the tail cone below the APU exhaust.

Tail Cone Strobe Light



Each strobe light includes two light units.

Strobe Lights



The strobe lights, as anti-collision lights, provide a white flashing light with high brightness.

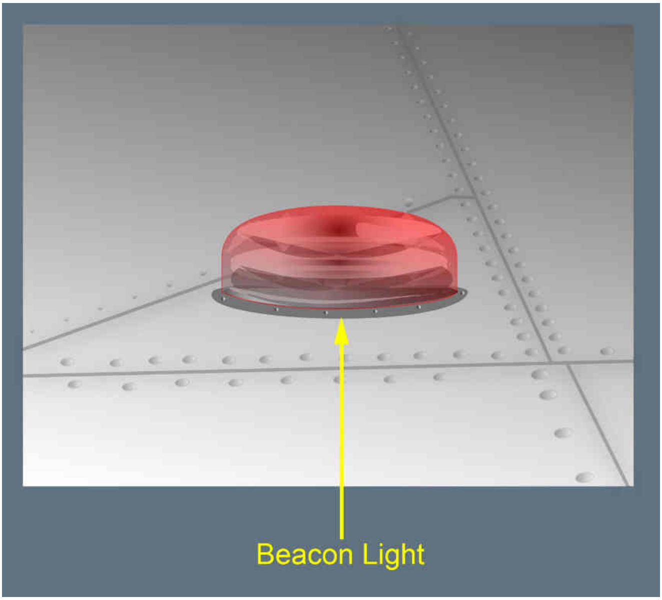
BEACON LIGHTS

Ident.: DSC-33-30-10-00013581.0001001 / 29 APR 14
Applicable to: ALL

The aircraft has two red beacon lights:

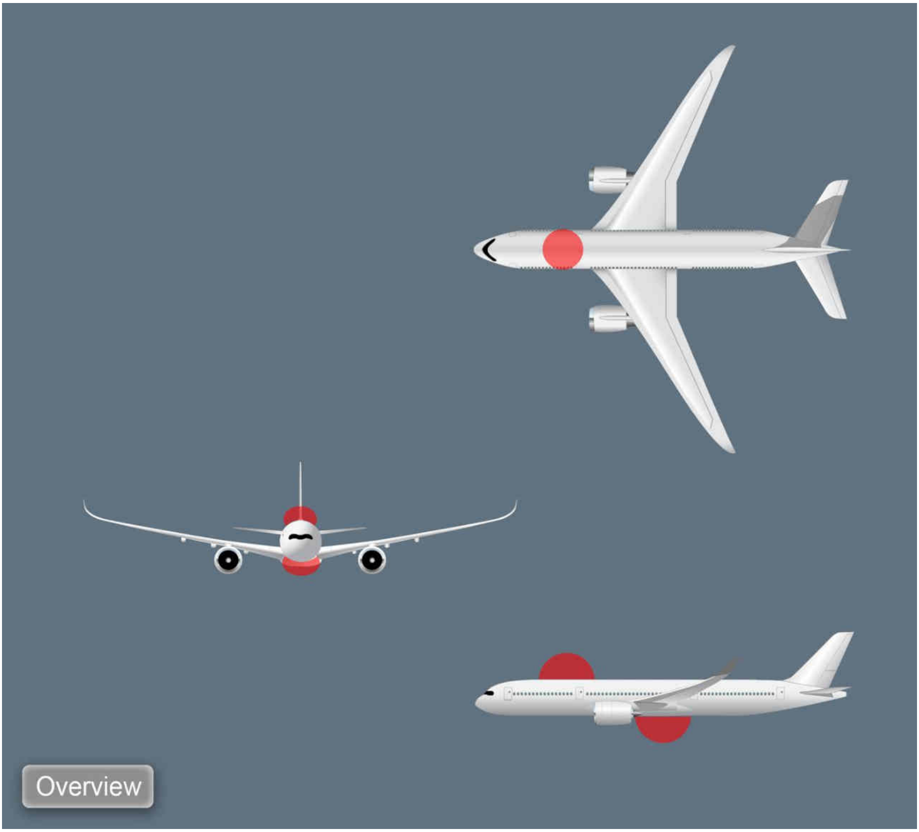
- One red beacon light on the top of the aircraft fuselage

Beacon Light



- One red beacon light in the lower part of the belly fairing.

Beacon Lights



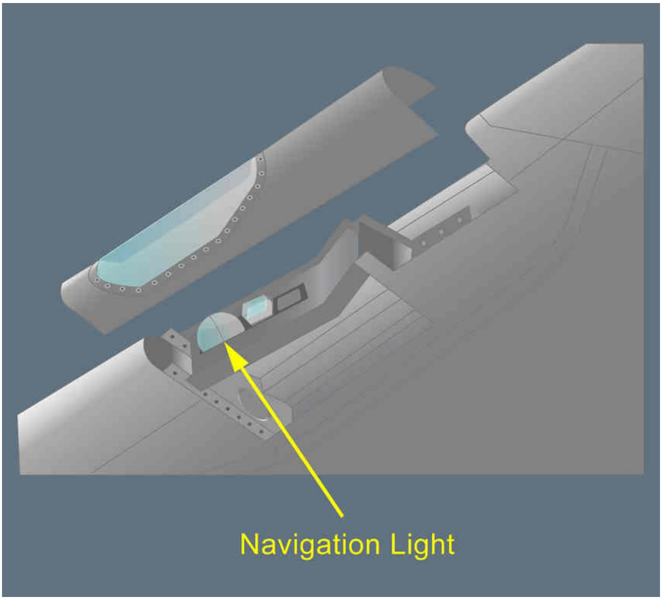
The beacon lights, as anti-collision lights, provide a red flashing light with high brightness.

NAVIGATION LIGHTS

Ident.: DSC-33-30-10-00013582.0002001 / 05 NOV 18
Applicable to: ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB

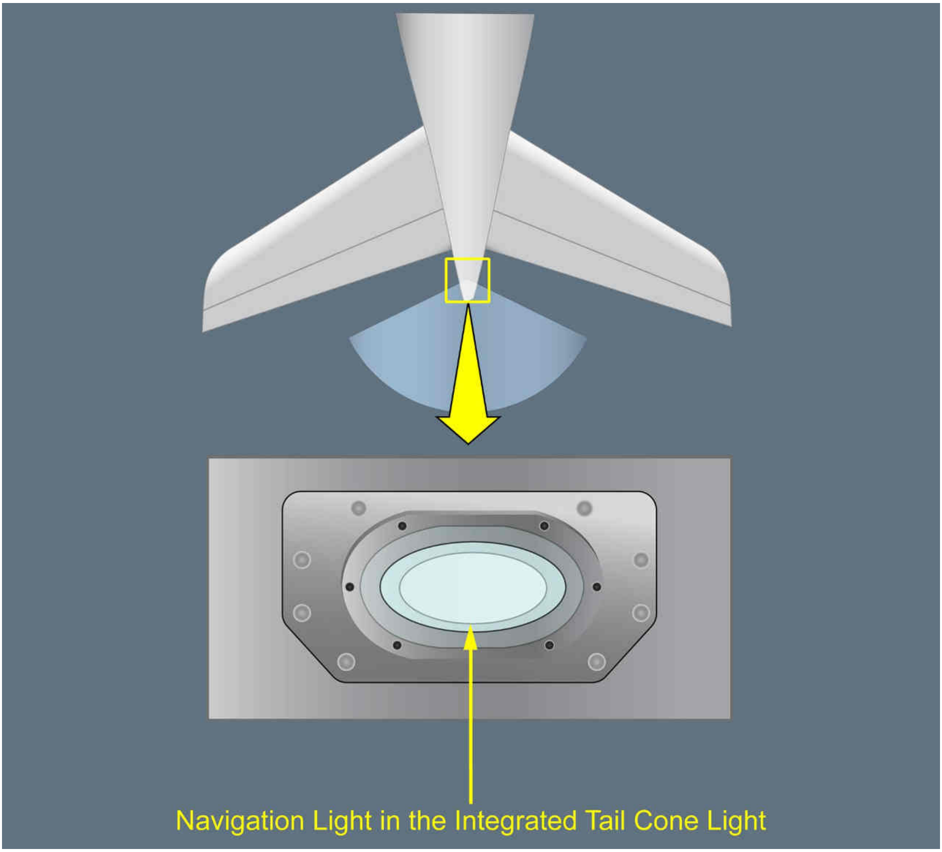
The aircraft has three navigation lights:
- One red navigation light on the left wingtip

Wingtip Navigation Light



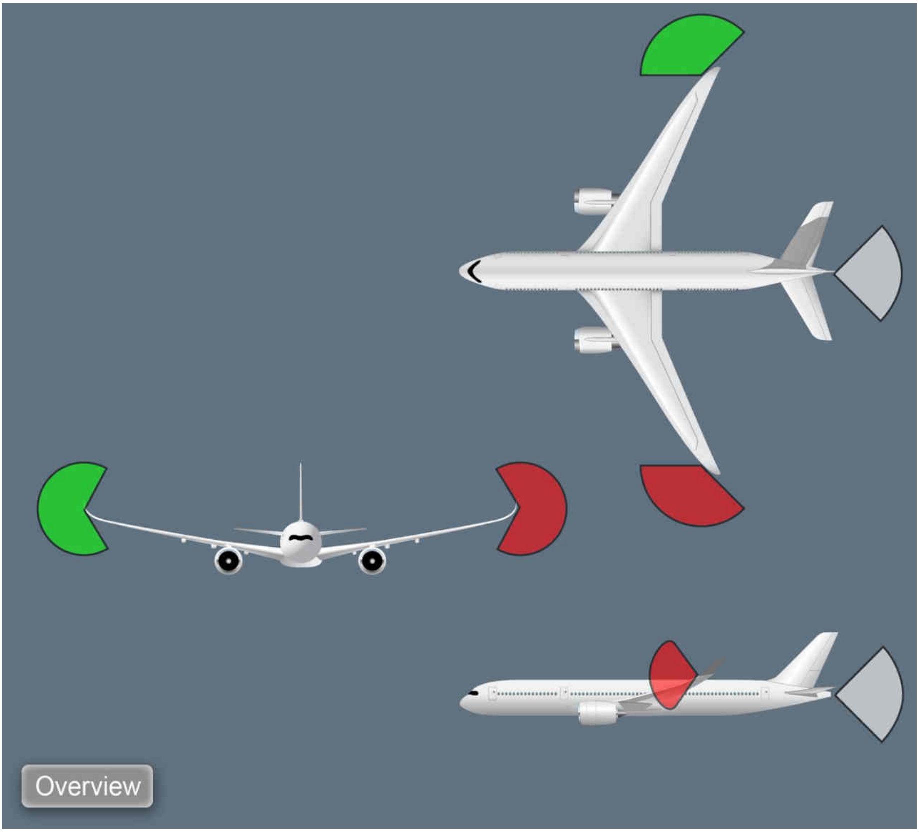
- One green navigation light on the right wingtip
- One white navigation light in the integrated tail cone light below the APU exhaust.

Tail Cone Navigation Light



Navigation Light in the Integrated Tail Cone Light

Navigation Lights



The navigation lights provide:
- An exterior and visual indication of the aircraft position
- The direction of flight of the aircraft.

The navigation lights have two independent systems: NAV LT 1 and NAV LT 2. In normal operation, NAV LT 1 is always used. NAV LT 2 is used only when NAV LT 1 fails (EXT LT NAV LT 1 FAULT).

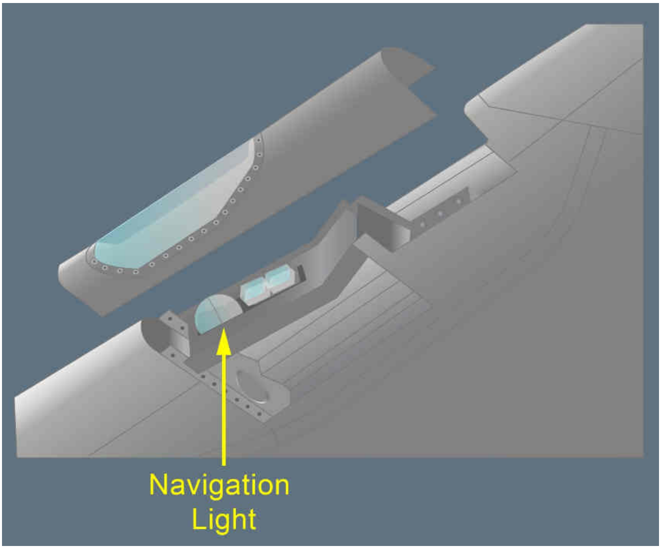
NAVIGATION LIGHTS

Ident.: DSC-33-30-10-00013582.0001001 / 29 APR 14
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD

The aircraft has three navigation lights:

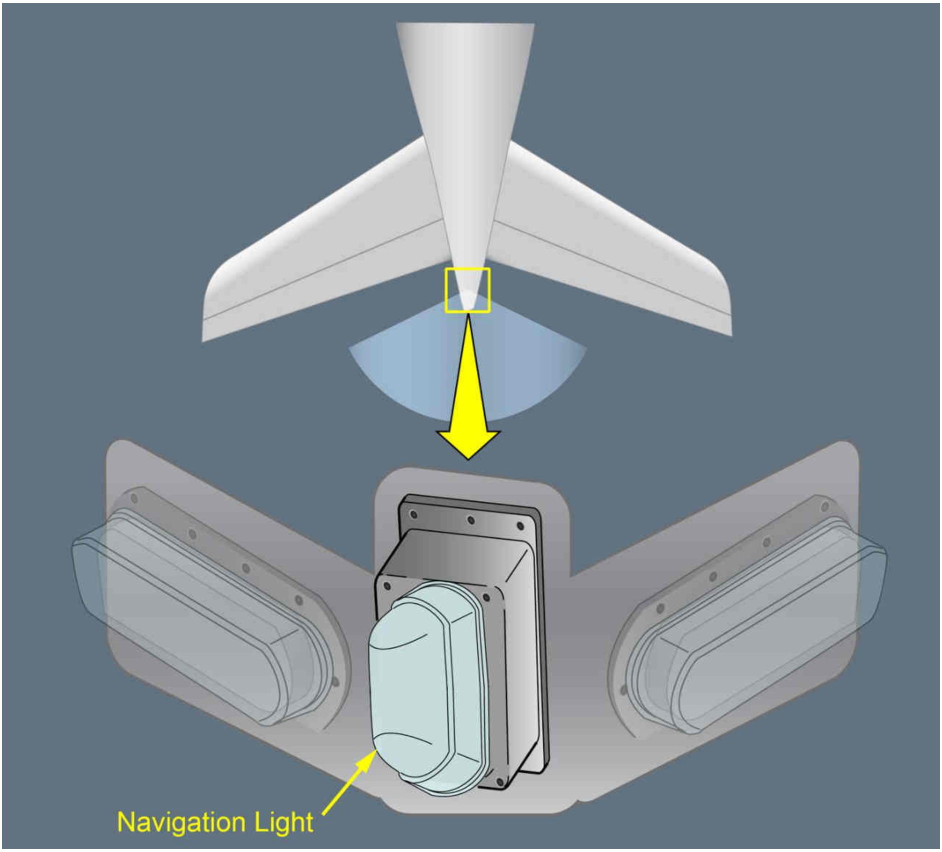
- One red navigation light on the left wingtip

Wingtip Navigation Light

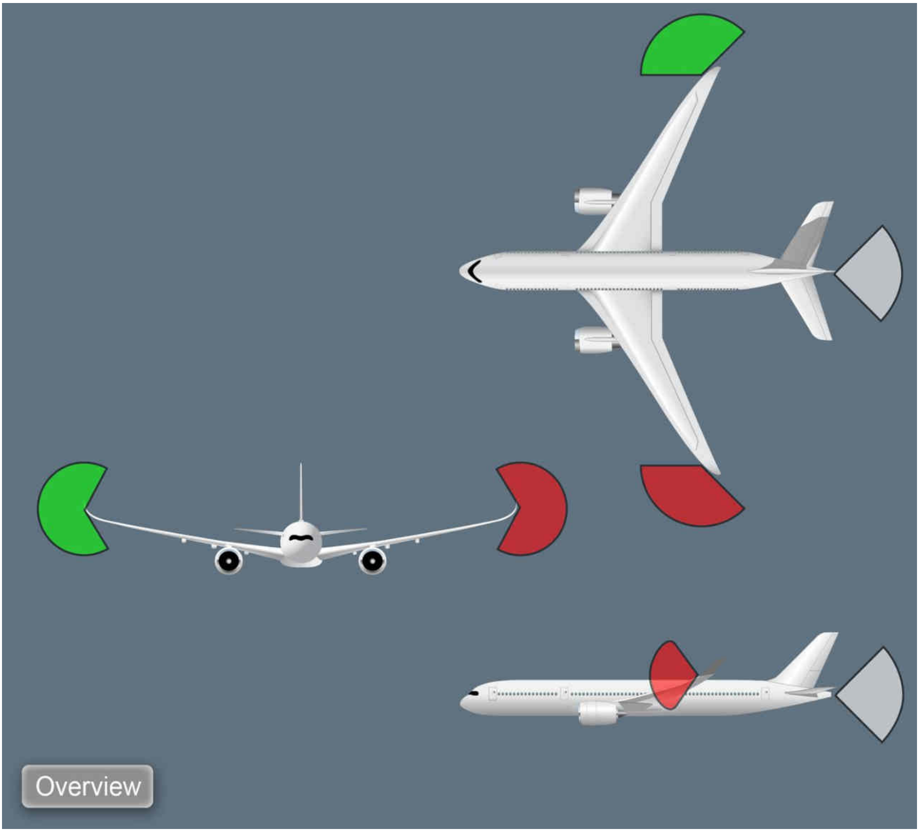


- One green navigation light on the right wingtip
- One white navigation light on the tail cone below the APU exhaust.

Tail Cone Navigation Light



Navigation Lights



The navigation lights provide:
- An exterior and visual indication of the aircraft position
- The direction of flight of the aircraft.

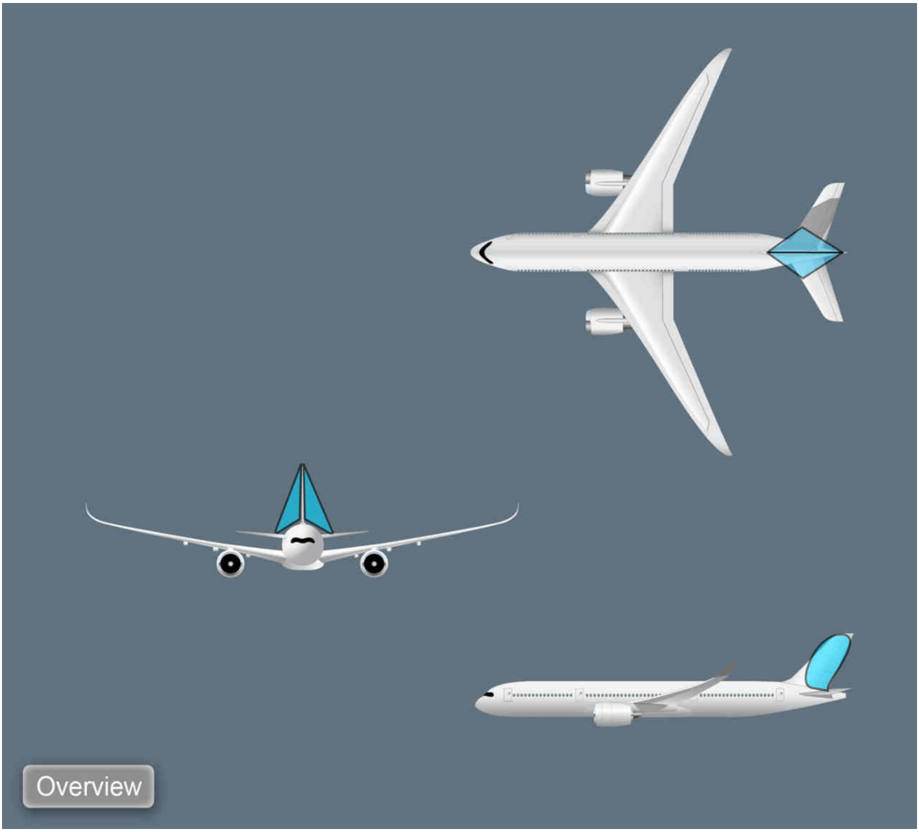
The navigation lights have two independent systems: NAV LT 1 and NAV LT 2. In normal operation, NAV LT 1 is always used. NAV LT 2 is used only when NAV LT 1 fails (EXT LT NAV LT 1 FAULT).

LOGO LIGHTS

Ident.: DSC-33-30-10-00013583.0001001 / 29 APR 14
Applicable to: ALL

The aircraft has two logo lights: One logo light on each side of the horizontal stabilizer.

Logo Lights



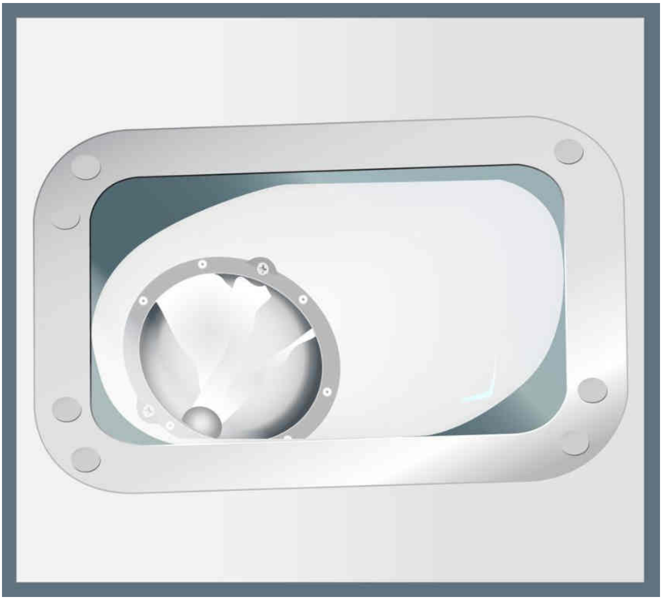
The logo lights provide lighting on the company logo.

WING AND ENGINE SCAN LIGHTS

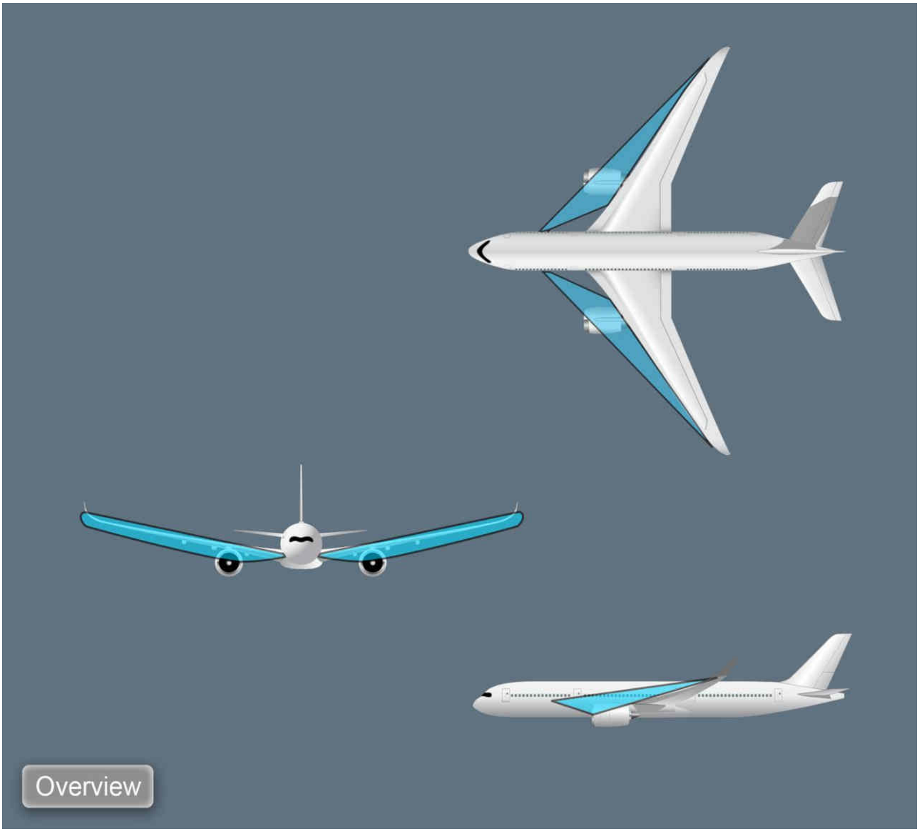
Ident.: DSC-33-30-10-00013584.0001001 / 29 APR 14
Applicable to: ALL

The aircraft has two wing and engine scan lights: One wing and engine scan light on each side of the fuselage.

Wing and Engine Scan Lights



Wing and Engine Scan Lights



The wing and engine scan lights provide lighting on:
- The leading edges of the wings
- The engines air inlet.

The wing and engine scan lights enable the flight crew to visually detect ice accretion.

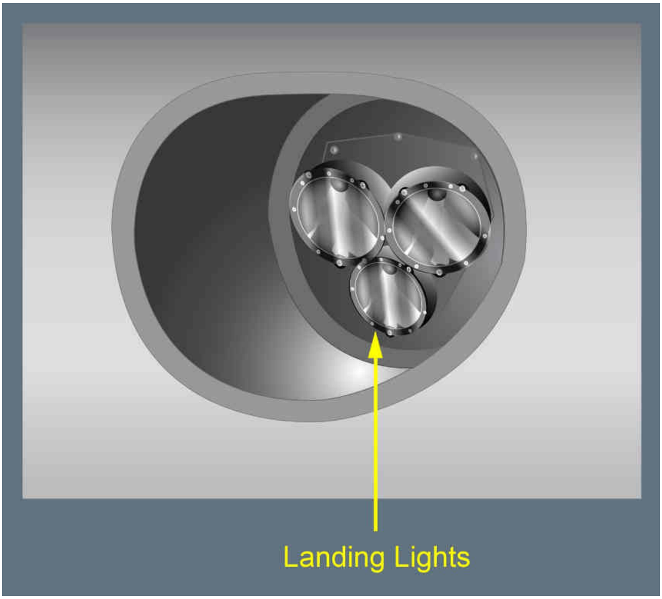
LANDING LIGHTS

Ident.: DSC-33-30-10-00013585.0001001 / 15 APR 19
Applicable to: ALL

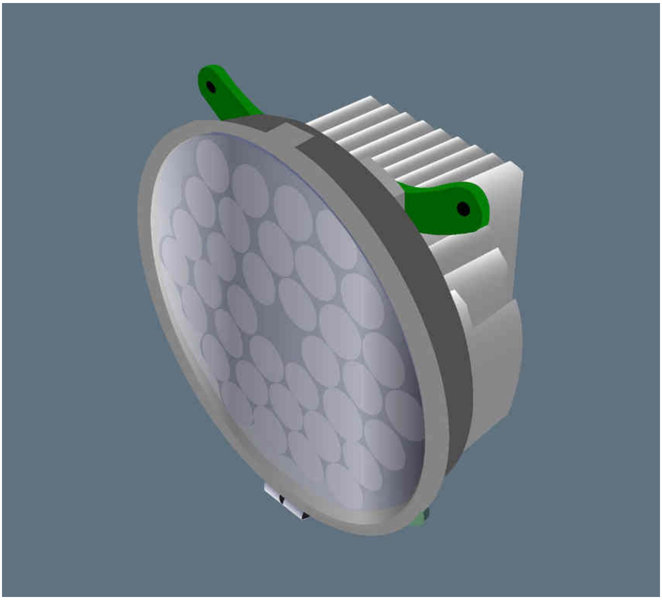
The aircraft has two landing lights units: One unit on the leading edge of each wing root.

L2 The aircraft is equipped with:
- Bulb-based landing lights, or
- LED-based landing lights ⊲✳ .

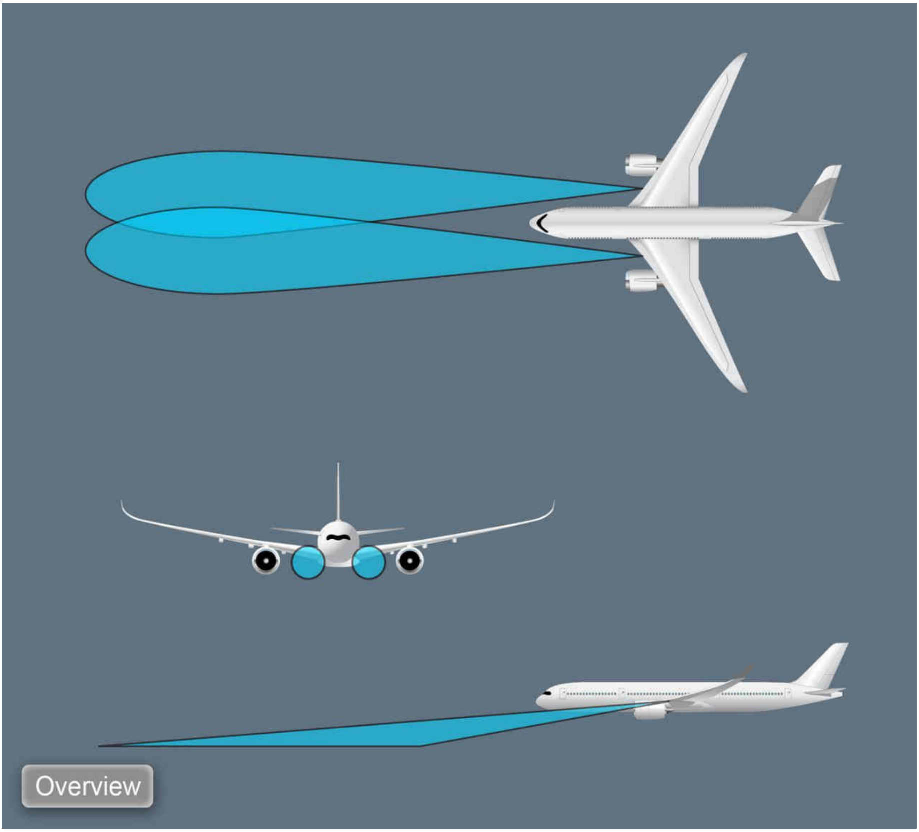
Bulb-Based Landing Lights



LED-Based Landing Lights



Landing Lights



L1 The landing lights provide lighting during landing and takeoff:
- At night
- In adverse weather conditions.

The landing lights help the flight crew to detect any obstacle on the runway.

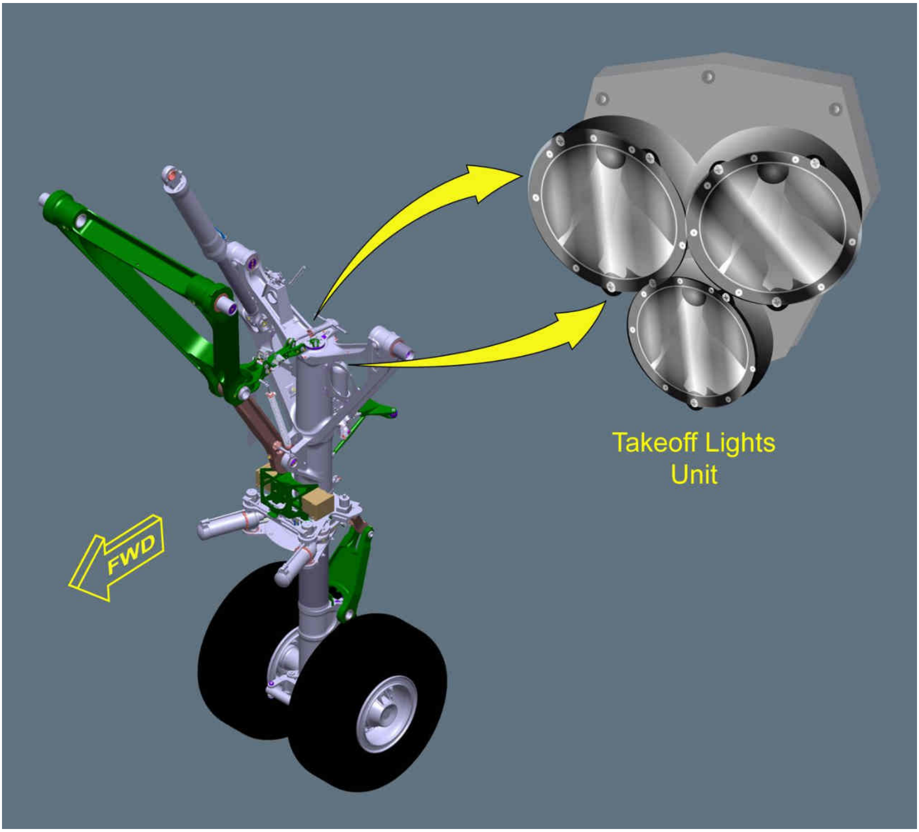
TAKEOFF LIGHTS

Ident.: DSC-33-30-10-00013586.0001001 / 15 APR 19
Applicable to: ALL

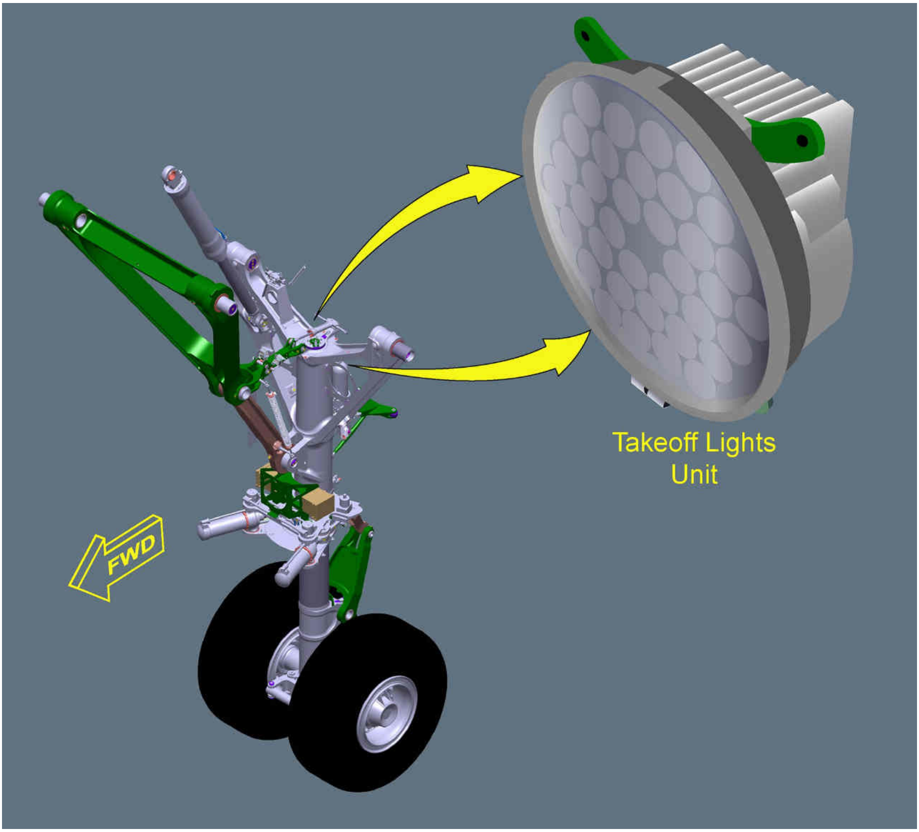
The aircraft has two takeoff lights units: One unit on each side of the NLG.

L2 The aircraft is equiped with:
- Two bulb-based takeoff lights units, or
- Two LED-based takeoff lights units ◁ .

Bulb-Based Takeoff Lights Unit

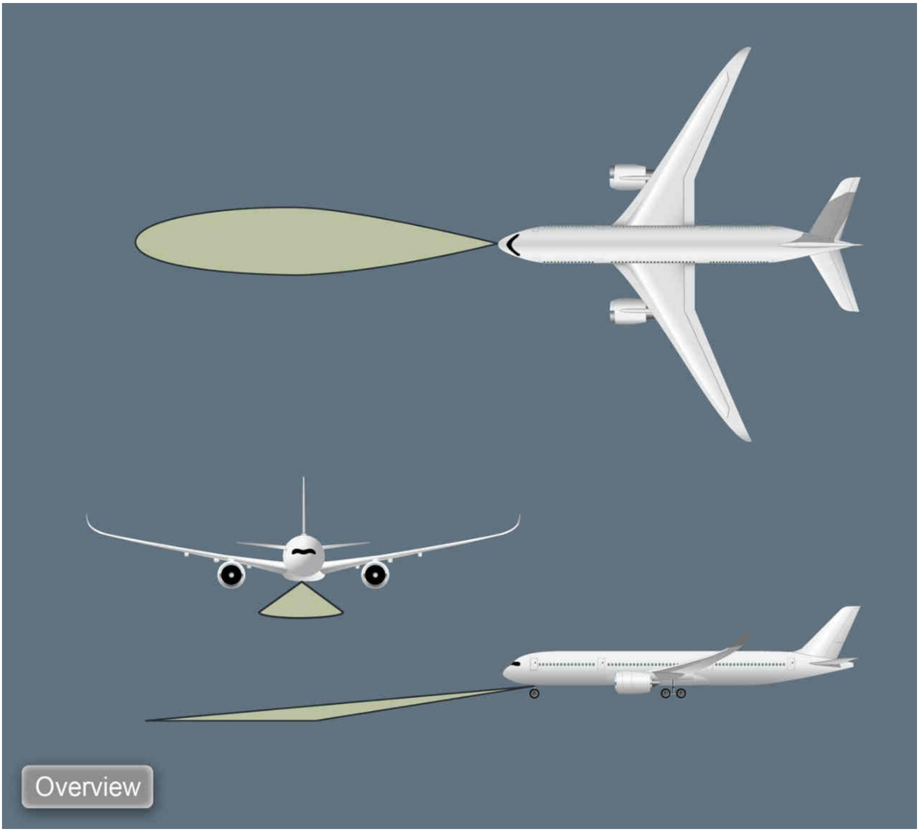


LED-based Takeoff Lights Unit



FWD
Takeoff Lights Unit

Takeoff Lights



L1 The takeoff lights provide lighting ahead of the aircraft. The takeoff lights enable the flight crew:
- To obtain a better visibility during takeoff
- To help identify any obstruction on the runway during takeoff
- To obtain a better visibility during landing.

The takeoff lights are controlled by the NOSE sw on the EXT LT panel.

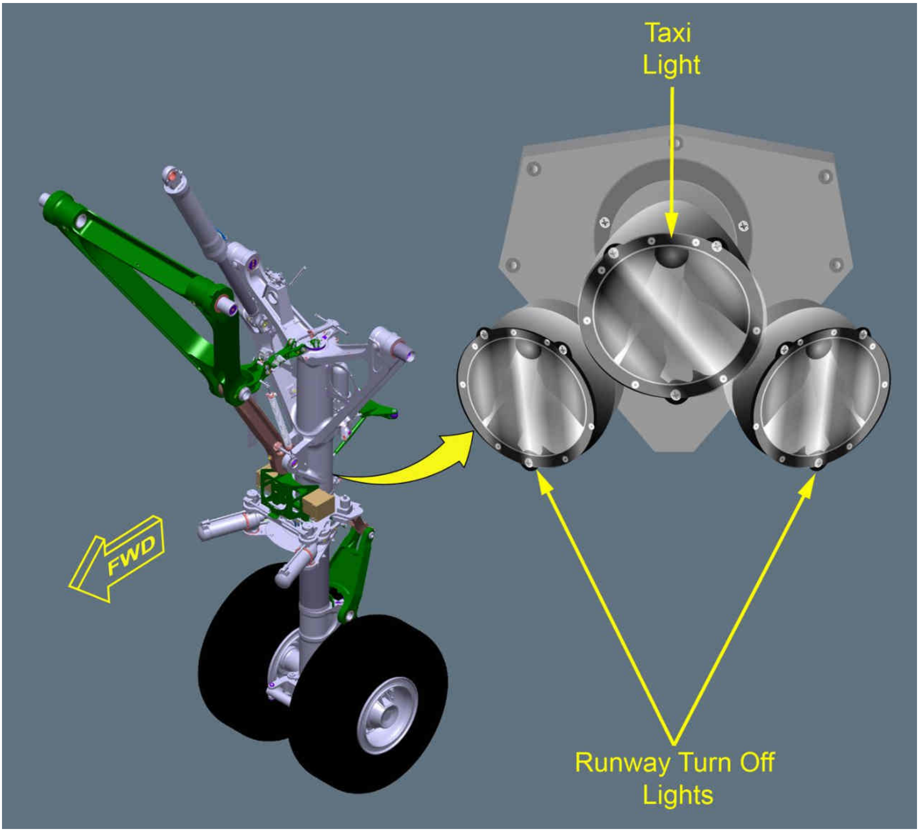
TAXI AND RUNWAY TURN OFF LIGHTS

Ident.: DSC-33-30-10-00013587.0001001 / 15 APR 19
Applicable to: ALL

The aircraft has one taxi light and two runway turn off lights on the NLG.

L2 The aircraft is equipped with:
- Bulb-based taxi and runway turn off lights, or
- LED-based taxi and runway turn off lights ⧏ .

Bulb-Based Taxi and Runway Turn Off Lights



Taxi Light

OVERVIEW

Ident.: DSC-33-40-10-00002472.0002001 / 29 APR 14
Applicable to: ALL

The aircraft has emergency lights that provide the cabin and the flight crew rest compartment with sufficient lighting, in the case of an emergency or an electrical power loss.

L2 The emergency lights have different functions:
- In normal operation and in emergency situation, the emergency lights indicate the way to the exit to leave the aircraft
- In emergency situation, the emergency lights provide lighting to:
  - The cabin
  - The flight crew rest compartment
  - The exit areas
  - The evacuation slides
  - The evacuation areas.

L1 The emergency lights of the cabin are:
- The floor path marking system (*Refer to DSC-33-40-10 Floor Path Marking System*)
- The overhead emergency lights (*Refer to DSC-33-40-10 Overhead Emergency Lights*)
- The flight crew rest compartment emergency lights (*Refer to DSC-33-40-10 Flight Crew Rest Compartment (FCRC) Emergency Lights*)
- The exit signs (*Refer to DSC-33-40-10 Exit Signs*)
- The evacuation area lights (*Refer to DSC-33-40-10 Evacuation Area Lights*)
- The emergency slide lights (*Refer to DSC-33-40-10 Emergency Slide Lights*)
- The lavatory emergency lights (*Refer to DSC-33-40-10 Lavatory Emergency Lights*).

All the cabin emergency lights (except the emergency slide lights) have an independent power supply (*Refer to DSC-33-40-10 Power Supply*).

FLOOR PATH MARKING SYSTEM

Ident.: DSC-33-40-10-00013913.0001001 / 29 APR 14
Applicable to: ALL

The floor path marking will guide the passengers to the exits if the overhead emergency and the exit signs are no longer visible (e.g. due to the smoke).

The floor path marking has:

- The aisle and the galley lights that are light strips on the floor, located:
  - At both sides of the aisles

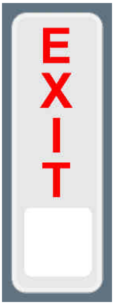
Aisle and Galley Lights

  - Where there is not carpet (e.g. galleys, stowage, and lavatories).
- The exit identifiers that provide lighting on the floor near the doors and the emergency exits. There are two types of exit identifiers:
  - The exit identifiers with the upper portion with a green pictogram

Green Exit Identifiers

  - The exit identifiers with the EXIT caption in red.

Red Exit Identifier



Exit Identifier, Aisle, and Galley Lights

FLIGHT CREW REST COMPARTMENT (FCRC) EMERGENCY LIGHTS

Ident.: DSC-33-40-10-00016580.0001001 / 29 APR 14
Applicable to: ALL

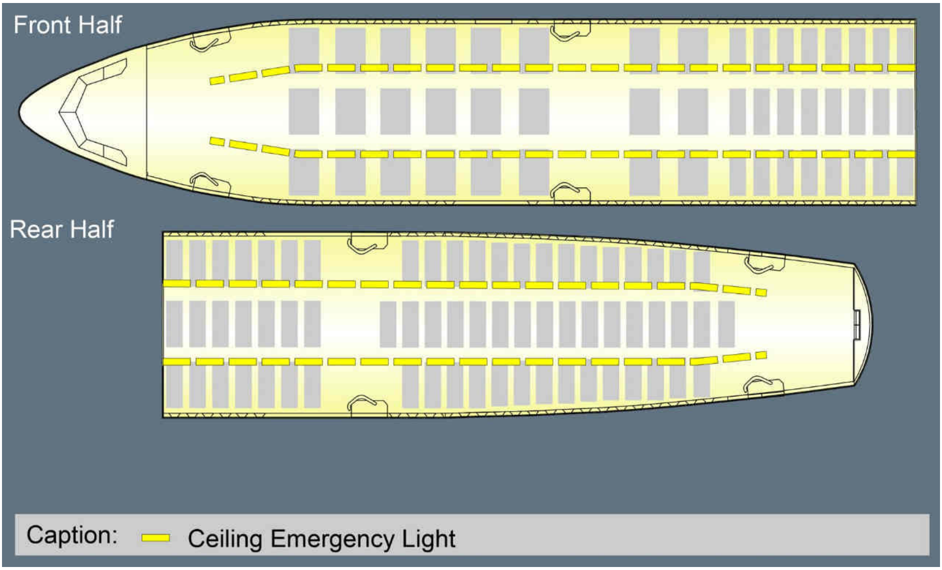
The Flight Crew Rest Compartment (FCRC) has:
- One emergency light that provide the FCRC and the door handle near the stairs with lighting
- Two emergency lights in the bunks that provide the oxygen masks with lighting.

OVERHEAD EMERGENCY LIGHTS

Ident.: DSC-33-40-10-00013915.0001001 / 29 APR 14
Applicable to: ALL

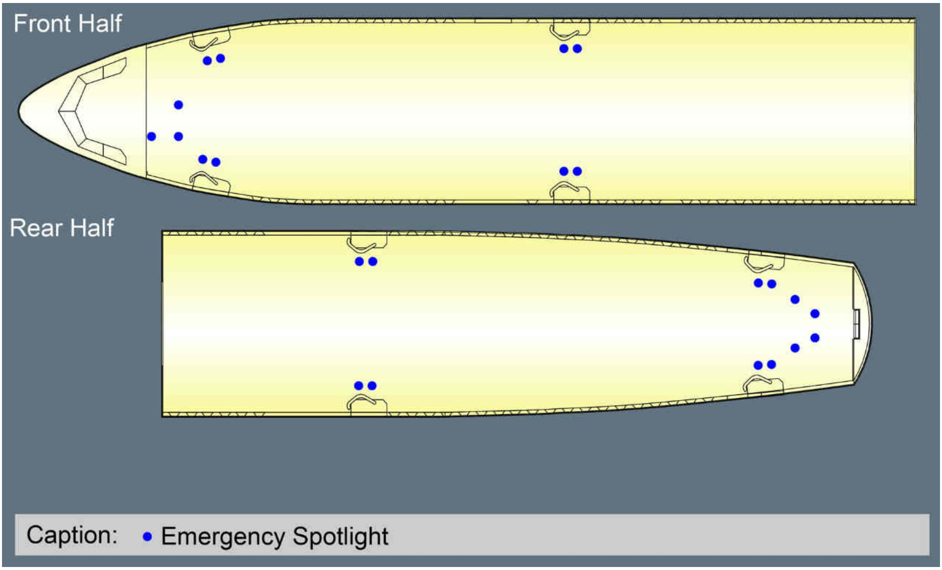
The overhead emergency lights are:
- The ceiling emergency lights that provide the main aisles with lighting

Ceiling Lights



- The emergency spotlights that provide the areas where it is not possible to install the ceiling emergency lights (e.g. the entry areas and the cross-aisles) with lighting.

Emergency Spotlights



Front Half
Rear Half
Caption: ● Emergency Spotlight

EXIT SIGNS

Ident.: DSC-33-40-10-00013914.0001001 / 24 SEP 19
Applicable to: ALL

The exit signs indicate the next exit to the passengers.

Depending on the configuration, the aircraft has:

- The exit location signs that indicate the position of the exit areas. The exit location signs are in the cross-aisles, and are visible throughout the main aisles

  There are two types of exit location signs:
  - The exit location signs with the green pictogram

    Exit Location Sign

    
  - The exit location signs with the EXIT caption in red.

- The exit marking signs that indicate the position of the doors. The exit marking signs are above the emergency exits

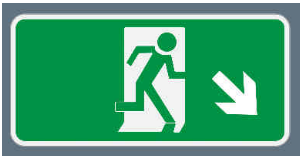
  There are two types of exit marking signs:
  - The exit marking signs with the green pictogram

    Exit Marking Sign

    
  - The exit marking signs with the EXIT caption in red.

- The additional exit signs that are in front of a possible obstacle that covers an exit location sign or an exit marking sign.

Additional Exit Sign



- The exit marking signs that indicate the position of the door Type A+ emergency exits. The exit signs have 2 arrows on the lens to highlight the dual lane of the slides.

EVACUATION AREA LIGHTS

Ident.: DSC-33-40-10-00013919.0001001 / 29 APR 14
Applicable to: ALL

The evacuation area lights provide the area of the ground where the slides will touch with lighting.
The aircraft has one evacuation area light in each door.

EMERGENCY SLIDE LIGHTS

Ident.: DSC-33-40-10-00013917.0001001 / 29 APR 14
Applicable to: ALL

The emergency slide lights provide the escape slides and the area in front of the slides with lighting, when the slides are deployed.
The emergency slide lights automatically come on when the slides are deployed.

LAVATORY EMERGENCY LIGHTS

Ident.: DSC-33-40-10-00013918.0001001 / 29 APR 14
Applicable to: ALL

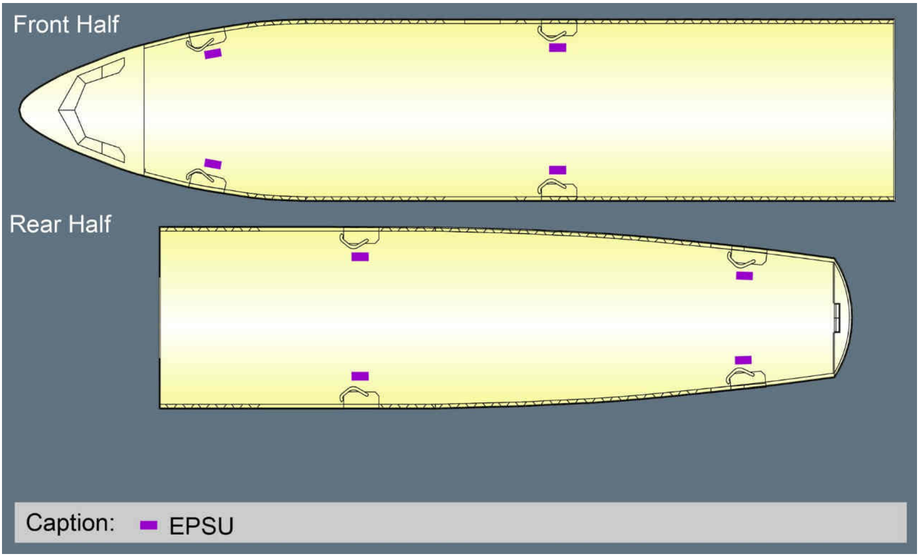
The lavatory emergency lights provide the lavatories with lighting in the case of a total loss of the cabin lighting.

POWER SUPPLY

Ident.: DSC-33-40-10-00013920.0001001 / 29 APR 14
Applicable to: ALL

All the cabin emergency lights (except the emergency slide lights) have an independent power supply: The Emergency Power Supply Units (EPSUs). A battery pack supplies the emergency slide lights.
The EPSUs are the control center of the cabin emergency lights (except the emergency slide lights).
There are 8 EPSUs: One for each door.
L2 For each door, an EPSU provides the cabin emergency lights with non essential DC power supply, or emergency DC power supply if not available.
If the non essential and emergency DC power supplies are not available, the internal battery pack of the EPSU automatically takes over the power supply of the cabin emergency lights for at least 10 min.

EPSUs



Front Half
Rear Half
Caption: ▬ EPSU

L1 For redundancy purposes, several cabin emergency lights are connected to two EPSUs.

NORMAL OPERATIONS

Ident.: DSC-33-40-30-00013924.0001001 / 07 MAY 18
Applicable to: ALL

The cabin emergency lights (except the emergency slide lights) can be controlled by:
- The flight crew, via the EMER EXIT LT sw
- The cabin crew, via the EMER pb-sw of the Flight Attendant Panels (FAPs).

However, the cabin emergency lights (except the emergency slide lights) automatically come on when the EMER EXIT LT sw is set to ARM, and :
- The 115 V AC power supply for the general lighting is no longer available, and/or
- The DC power supply is no longer available, and/or
- The DC EMER power supply is no longer available.

L2 The exit signs automatically come on in the case of an excessive cabin altitude.
Depending on Operator customization of the CIDS, actions on other SIGNS switches may automatically switch on or off the exit signs. For more information on the SIGNS switches, *Refer to DSC-33-50-10 Overview*.

GENERAL

Ident.: DSC-34-NAV-10-00012626.0001001 / 15 JUL 14
Applicable to: ALL

The navigation system includes the following equipment that provides the flight crew with flight and navigation parameters:
- Three Air Data/Inertial Reference Units (ADIRUs)
- The standby instruments
- Two Multi-Mode Receivers (MMRs)
- Three Radio Altimeters (RAs)
- The radio navigation system
- Two Airport Navigation Functions (ANFs).

ADIRS

The ADIRS provide primary flight and navigation parameters that are independent of the ground navigation aids.

L2 For more information, *Refer to DSC-34-NAV-20-10-10 Overview*.

L1 STANDBY INSTRUMENTS

The standby instruments include the Integrated Standby Instrument System (ISIS) and the standby magnetic compass. They provide the flight crew with backup flight and navigation parameters, that are independent of the ground navigation aids, in the case of loss of the three ADIRS.

L2 For more information, *Refer to DSC-34-NAV-30-10 Overview*.

L1 MMR

GNSS, LOC and G/S antennas provide navigation data to MMRs.

Each MMR enables:
- Global Navigation Satellite System (GNSS) function, which provides navigation parameters independent of ground navigation aids
- Landing functions, which provide several approach and landing means.

L2 For more information about the GNSS, *Refer to DSC-34-NAV-40 General*.
For more information about the landing systems, *Refer to DSC-34-NAV-50 Overview*.

L1 RA

The RAs provide the height of the aircraft above ground level.

L2 For more information, *Refer to DSC-34-NAV-60-10 General*.

L1 RADIO NAVIGATION SYSTEM

The radio navigation system provides navigation parameters dependent of ground navigation aids.

L2 For more information, *Refer to DSC-34-NAV-70-10 General*.

L1 ANF

The ANF displays airport moving maps.

L2 For more information, *Refer to DSC-34-NAV-80-10 General*.

Overview

OVERVIEW

Ident.: DSC-34-NAV-20-10-10-00003265.0001001 / 06 AUG 14
Applicable to: ALL

The Air Data/Inertial Reference System (ADIRS) provides flight and navigation data. The ADIRS supplies temperature, anemometric, barometric, time and inertial data primarily to the EFIS (PFD and ND) and to the ISIS, in addition to other aircraft systems (FMS, FADECs, PRIMs, ECAM, etc.).

ADIRU 1(2)(3)

There are three identical Air Data/Inertial Reference Units (ADIRUs).

Each ADIRU has two independent parts:
- The Air Data Reference (ADR)

L2 For more information, *Refer to DSC-34-NAV-20-10-30 Air Data Source & Display Reconfiguration*.

L1
- The Inertial Reference (IR).

L2 For more information, *Refer to DSC-34-NAV-20-10-40 General*.

L1 Each part (either the ADR or the IR) can operate independently.

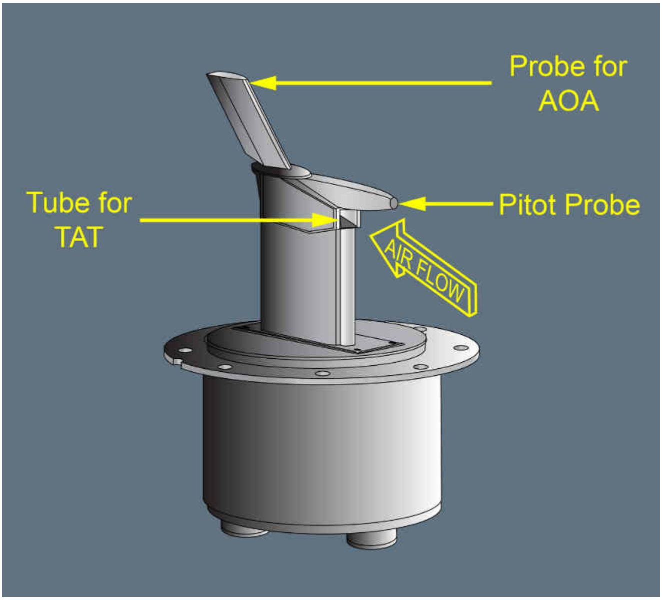
Ident.: DSC-34-NAV-20-10-20-10-00003270.0001001 / 06 AUG 14
Applicable to: ALL

MFP

The Multi Function Probes (MFPs) provide the Angle-Of-Attack (AOA), the Total Air Temperature (TAT), and the total pressure.
There are three MFPs.
Each ADIRU is connected to one MFP.
One MFP is on the left side of the aircraft, and the two other MFPs are on the right side of the aircraft.

L2 Each MFP sends a raw measurement of the AOA to the PRIMs for the Gust Load Alleviation (GLA) function (*Refer to DSC-27-10-30 Load Alleviation Function*).

MFP probe



Ident.: DSC-34-NAV-20-10-20-10-00003271.0001001 / 06 AUG 14
Applicable to: ALL

STATIC PROBES

The static probes provide the local static pressure.
There are 6 static probes.
Three static probes are on the right side of the aircraft, and three others are on the left side of the aircraft.
Each ADIRU is connected to two static probes, one on each side of the fuselage.

Ident.: DSC-34-NAV-20-10-20-10-00003272.0002001 / 07 JUN 19
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN

SSA PROBE

There are three Side Slip Angle (SSA) probes.
The SSA probes are on the nose of the aircraft.
The SSA probes are deactivated and do not provide any data to the aircraft.

Ident.: DSC-34-NAV-20-10-20-10-00012084.0001001 / 04 DEC 14
Applicable to: ALL

OAT PROBES

The Outside Air Temperature (OAT) probes provide the static air temperature on ground, during takeoff and landing.
There are two OAT probes.
The OAT probes are in the nose landing gear bay.

L2 The three ADIRUs use the data of the OAT probes:
- The OAT 1 is connected to the ADIRU 1
- The OAT 2 is connected to the ADIRU 2 and ADIRU 3.

Ident.: DSC-34-NAV-20-10-20-10-00012085.0001001 / 02 APR 15
Applicable to: ALL

FOURTH AOA PROBE

The fourth AOA probe provides the flight control computers with a raw measurement of the angle-of-attack.
The fourth AOA probe is on the left side of the aircraft.

Ident.: DSC-34-NAV-20-10-20-10-00003273.0001001 / 06 AUG 14
Applicable to: ALL

MMRs

Two Multi Mode Receivers (MMRs) provide the ADIRS with the GNSS data.
L2 For more information about the GNSS data that the ADIRS uses, *Refer to DSC-34-NAV-40 GNSS Data to ADIRS*.
L1 Each ADIRU is connected to both MMRs.

Ident.: DSC-34-NAV-20-10-20-10-00016465.0001001 / 06 AUG 14
Applicable to: ALL

DISPLAYS

The ADIRS data appears on the:
- PFD
L2 For more information, *Refer to DSC-34-NAV-20-20 PFD*.
- L1 ND
L2 For more information, *Refer to DSC-34-NAV-20-20 ND*.
- L1 ISIS
L2 For more information,*Refer to DSC-34-NAV-20-20 ISIS*.

L1 - MFD

L2 For more information,*Refer to DSC-34-NAV-20-20 MFD*.

L1 - Permanent Data

L2 For more information,*Refer to DSC-34-NAV-20-20 Permanent Data*.

ADR

ADR

Applicable to: ALL

Ident.: DSC-34-NAV-20-10-30-10-00021270.0002001 / 07 JUN 19

GENERAL

The ADR provides the following air data:
- Total pressure
- Static pressure
- Altitude
- Mach number
- Computed airspeed
- True airspeed
- Total air temperature
- Static air temperature
- Vertical speed
- Angle-of-attack.

Each ADR is connected to the following probes:
- One Multi Function Probe (MFP)
- Two static probes
- One Outside Air Temperature (OAT) probe.

All the probes connected to the ADRs , except the OAT probes, are automatically heated to prevent ice formation.

L2 For more information, *Refer to DSC-30-20-10 Probe Heating*.

Ident.: DSC-34-NAV-20-10-30-10-00016338.0001001 / 06 AUG 14

AIR DATA SOURCE AND DISPLAY RECONFIGURATION

The ADIRS has three fully segregated sources of air data parameters.
With the ISIS system that is independent from the ADIRS, the aircraft has four fully segregated sources of air data.
The CDS uses the ADIRS for display on the PFD. In case of loss of air data from ADIRS, the CDS can also use the ISIS for display on the PFD.

L2 For more information about the display of ISIS air data on the PFD, *Refer to DSC-34-NAV-20-30 Display of ISIS Speed and Altitude Indications*.

For more information about the backup manual reconfiguration, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.

Intentionally left blank

IR

IR

Applicable to: ALL

Ident.: DSC-34-NAV-20-10-40-10-00003296.0001001 / 06 AUG 14

GENERAL

The IR provides the following inertial reference data:
- Navigation information

L3 The navigation information includes:
  - The position
  - The ground speed
  - The barometric inertial vertical speed
  - The speeds and accelerations all along the aircraft and earth axes.

L1
- Attitude information

L3 The attitude information includes:
  - The pitch and roll angles
  - The pitch and roll rotation rates
  - The pitch and roll rotation accelerations.

L1
- Heading information.

L3 The heading information includes:
  - The magnetic heading and the true heading
  - The magnetic track and the true track
  - The yaw rotation rates
  - The yaw rotation acceleration.

L1 Each IR uses data from its internal gyrometer and accelerometer sensors.
Each IR also receives GNSS data from both MMRs for initial alignment, and for the computation of the Global Positioning and Inertial Reference System (GPIRS) position.

L2 For more information about:
- The GNSS data that the ADIRS uses, *Refer to DSC-34-NAV-40 GNSS Data to ADIRS*
- The GPIRS position, *Refer to DSC-34-NAV-20-10-60 Position Computation*.
- The IR alignment, *Refer to IR Alignment*

L1 The flight crew can check the status, deviation, and drift of each IR on the FMS POSITION/IRS page of the MFD.

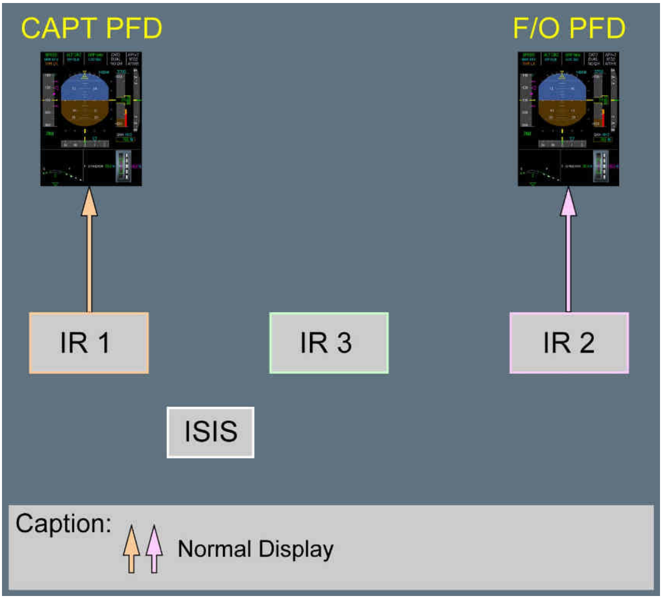
Ident.: DSC-34-NAV-20-10-40-10-00021422.0001001 / 06 AUG 14

INERTIA DISPLAY RECONFIGURATION

For inertial data, the PRIMs and the CDS can also use the ISIS data.

L2 For more information about the display of ISIS air data on the PFD, *Refer to DSC-34-NAV-20-30 Display of ISIS Inertial Data*.

Inertial Data Display — Automatic Reconfiguration



Ident.: DSC-34-NAV-20-10-40-10-00003297.0001001 / 06 NOV 14

IR MODES

Each IR can operate in the following two modes:
- NAV mode
- ATT mode.

The flight crew can change the IR mode via the IR mode selector.

L2 For more information, *Refer to IR 1(2)(3) mode selector*.

L1 NAV MODE

NAV mode is the normal mode of operation of the IR after alignment.
In NAV mode, the IR provides navigation, attitude and heading data.

ATT MODE

ATT mode is the abnormal mode of operation of the IR.
In ATT mode, the IR only provides the attitude and the heading data.
The heading data is only available after the flight crew enters the current heading on the FMS POSITION/IRS page of the MFD.

L2 In ATT mode, heading will drift over time. The flight crew must monitor and periodically correct the heading.
For more information about abnormal operations in ATT mode, *Refer to DSC-34-NAV-20-30 ATT Only Operation*.

L1 The flight crew can only recover the NAV mode on ground after a complete alignment.
When an IR is in ATT mode, the PFD automatically displays another IR in NAV mode.

L2 For more information, *Refer to DSC-34-NAV-20-10-40 Inertia Display Reconfiguration*.

Ident.: DSC-34-NAV-20-10-40-10-00003294.0001001 / 08 JUL 19

IR ALIGNMENT

The IRs must be aligned in order to operate in NAV mode and continuously provide the aircraft position.
To start an alignment, the IRs must be initialized to an appropriate position, from which the IRs determine the subsequent aircraft positions during flight.
To perform an alignment, the aircraft must be stopped. In the case of aircraft movement during the IRS alignment, the flight crew must perform a new full alignment.

Note: *The alignment during engine start or while engines are running is possible.*

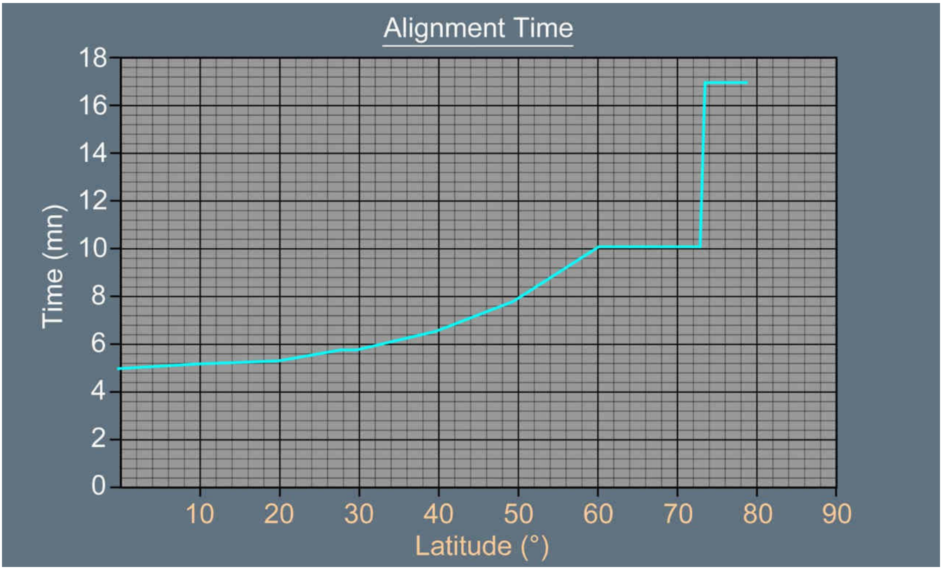
The flight crew may decide to perform:

- A complete alignment, or

L2 A complete alignment lasts between 5 and 17 min, depending on the aircraft latitude.

L3 A complete alignment is only possible between 82 ° N and 78 ° S.

Alignment Time



L1 - A fast alignment.

L2 A fast alignment lasts approximately 30 s.

L1 COMPLETE ALIGNMENT

During a complete alignment, the IR automatically determines the following inertial reference data:

- The navigation information
- The attitude information
- The heading information.

The IR starts a complete alignment at power-up, as soon as the flight crew sets the IR mode selector to NAV.

L2 To perform a new complete alignment with the IR already on, the flight crew must perform the following actions, in the following sequence:
- Turn off the IR
  To turn off the IR, the flight crew must set the IR mode selector to OFF for more than 5 s.
- Set the IR mode selector to NAV.

L3 During a complete alignment, the IR uses gravity to determine the aircraft attitude. Then, the IR determines the true heading, and estimates the current latitude.

L1 When the IR starts a complete alignment, the IR initializes the aircraft position. There are two types of position initialization:
- If the GNSS is available, the initialization is automatic, and uses the GNSS position. No flight crew action is necessary
- If the GNSS is not available, or if the flight crew wants to override the automatic initialization, manual initialization is possible, at any moment during the alignment phase.
  To perform manual initialization, the flight crew must enter the required position on the FMS POSITION/IRS page of the MFD.
  L2 For more information, *Refer to ALIGN ON OTHER REF function*.

L3 During a complete alignment, the IR checks the GNSS position (or the manually-entered position) with the last-known aircraft position stored in the ADIRU, and with the IR computed latitude.

L1 FAST ALIGNMENT

The flight crew can perform a fast alignment, only if the IR is in NAV mode.
During a fast alignment, the IR automatically updates the aircraft ground speed.
L2 During a fast alignment, the IR resets the ground speed to 0. Therefore, the IR computes the navigation data with updated ground speed.
L3 During a fast alignment, the IR does not update the latitude, attitude and heading.
L1 The IR starts a fast alignment, when the flight crew sets the IR mode selector from NAV to OFF, and then back to NAV within 5 s.
The IR updates the aircraft position, only if the flight crew enters a position via the ALIGN ON OTHER REF function on the FMS POSITION/IRS page of the MFD.
L2 For more information, *Refer to ALIGN ON OTHER REF function*.
L3 If the flight crew enters a position on the FMS POSITION/IRS page on the MFD, the IR checks the new position with the last-known aircraft position stored in the ADIRU.

Intentionally left blank

ADIRS Monitoring

ADIRS MONITORING

Ident.: DSC-34-NAV-20-10-50-00016563.0003001 / 18 MAR 19
Applicable to: ALL

The ADIRS provides essential air data and inertial reference data for many aircraft systems. The below systems continuously monitor this data:

- The ADIRUs

L2 If the ADIRUs reject one or more air data sources, the ECAM triggers:

- One or more of the following alerts:
  - ■ NAV ADR 1(2)(3) FAULT (*Refer to procedure*)
  - ■ NAV ADR 1+2(1+3)(2+3) FAULT (*Refer to procedure*)
  - ■ NAV ADR 1+2+3 DATA DEGRADED (*Refer to procedure*)
  - ■ NAV ADR 1+2+3 FAULT (*Refer to procedure*)
  - ■ NAV IR 1(2)(3) FAULT (*Refer to procedure*)
  - ■ NAV IR 1+2(1+3)(2+3) FAULT (*Refer to procedure*)
  - ■ NAV IR NOT ALIGNED (*Refer to procedure*)
  - ■ NAV ISIS FCUB BARO REF DISAGREE (*Refer to procedure*)

L3
- One or more of the following dispatch messages:
  - ■ NAV ADR 1(2)(3) STATIC PROBE (*Refer to MMEL/ME-DM-NAV NAV ADR 1(2)(3) STATIC PROBE*)
  - ■ NAV GNSS 1(2)(1+2) REJECTED BY IRs (*Refer to MMEL/ME-DM-NAV NAV GNSS 1(2)(1+2) REJECTED BY IRs*)
  - ■ NAV MFP 1(2)(3) TAT (*Refer to MMEL/ME-DM-NAV NAV MFP 1(2)(3) TAT*)
  - ■ NAV OAT 1(2) PROBE (*Refer to MMEL/ME-DM-NAV NAV OAT 1(2) PROBE*)
  - ■ NAV SIDESLIP PROBE 1(2)(3) (*Refer to MMEL/ME-DM-NAV NAV SIDESLIP PROBE 1(2)(3)*).

L1
- The PRIMs

L2 If the PRIMs reject one or more sources of air data or inertial reference data, the ECAM triggers:

- One or more of the following alerts:
  - ■ AUTO FLT A/THR OFF (*Refer to procedure*)
  - ■ AUTO FLT AP OFF (*Refer to procedure*)
  - ■ F/CTL DIRECT LAW (PROT LOST) (*Refer to procedure*)
  - ■ NAV AIR DATA REDUNDANCY LOST (*Refer to procedure*)
  - ■ NAV AOA DISAGREE (*Refer to procedure*)
  - ■ NAV ISIS ALT(ATT)(SPD) UNRELIABLE (*Refer to procedure*)
  - ■ NAV ISIS ALT(SPD) RECOVERED (*Refer to procedure*)
  - ■ SURV REACTIVE W/S DET FAULT (*Refer to procedure*).

L3
- One or more of the following dispatch messages:
  - ■ NAV ADR 1(2)(3) REJECTED BY PRIMs (*Refer to MMEL/ME-DM-NAV NAV ADR 1(2)(3) REJECTED BY PRIMs*)
  - ■ NAV AOA 4 PROBE (*Refer to MMEL/ME-DM-NAV NAV AOA 4 PROBE*)
  - ■ NAV IR 1(2)(3) REJECTED BY PRIMs (*Refer to MMEL/ME-DM-NAV NAV IR 1(2)(3) REJECTED BY PRIMs*)
  - ■ NAV ISIS INERT DATA REJECTED BY PRIMs (*Refer to MMEL/ME-DM-NAV NAV ISIS INERT DATA REJECTED BY PRIMs*)
  - ■ NAV ISIS AIR DATA REJECTED BY PRIMs (*Refer to MMEL/ME-DM-NAV NAV ISIS AIR DATA REJECTED BY PRIMs*)

L1 The PRIMs send information about the rejection to the CDS for display reconfiguration.

L3 The PRIMs monitor the air and inertial data: when one source diverges from the median value, above a certain threshold, the PRIMs automatically reject this source, and the PRIMs continue to operate with the remaining sources. Based on this monitoring, the CDS automatically reconfigures the data sources. It ensures the display of consistent values on both PFDs.

The PRIMs continue to monitor the rejected air data source. If the PRIMs confirm that a rejected air data source is back to normal (compared to two other valid sources), the automatic reconfiguration of the PFD display may allow to reuse this air data source.

L1 The PRIMs use the ADIRUs for the flight control laws.

L2 For the flight control laws, the PRIMs cannot reuse a rejected air or inertial data source even if this source is back to normal. In case of rejection of all ADRs or IRs, the PRIMs reconfigure the flight control law to alternate law. For more information, *Refer to DSC-27-10-40 Alternate Law*.

L1 - The FADECs

L3 Each FADEC monitors the computed air data from the three ADIRUs, the ISIS, and the engine sensors, for its air data selection.

L1 - The FWS.

L2 If the FWS detects a difference between two values or a failure, the ECAM triggers:

- One or more of the following alerts:
  - ■ NAV CAPT & F/O ATT DISAGREE (*Refer to procedure*) associated with the CHECK ATT message on the PFD
  - ■ NAV CAPT & F/O HDG DISAGREE (*Refer to procedure*) associated with the CHECK HDG message on the PFD and ND
  - ■ NAV GNSS/ACFT POS DISAGREE (*Refer to procedure*)
  - ■ NAV CAPT & F/O BARO VALUE DISAGREE (*Refer to procedure*)
  - ■ NAV CAPT & F/O BARO REF DISAGREE (*Refer to procedure*)
- L3 The following dispatch message:
  - ■ NAV RESIDUAL AIRSPEED 1(2)(3) (*Refer to MMEL/ME-DM-NAV NAV RESIDUAL AIRSPEED 1(2)(3)*).

The FWS compares the air data and inertial data displayed on the CAPT inner DU with the data displayed on the F/O inner DU.

L2 The FWS also monitors the temperature probes and residual airspeed to detect failures.

L1 The CDS receives:

- Air data and inertial data from four sources: the ADIRS and the ISIS
- The backup air data from the backup sources: the FADECs or the AOA Probes
- Confirmation that this data is accurate from the PRIMs.

When a source is rejected or inoperative, the CDS automatically reconfigures the PFD display. It reconfigures as below:

- In the case of failure that affects up to three air data and inertial data sources, the PFD display uses the remaining sources
- In the case of failure of all air data sources, the PFD display uses the backup air data source.

L2 For more information about the backup speed and altitude indications, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.

Aircraft Position

POSITION COMPUTATION

Ident.: DSC-34-NAV-20-10-60-00012087.0001001 / 06 AUG 14
Applicable to: ALL

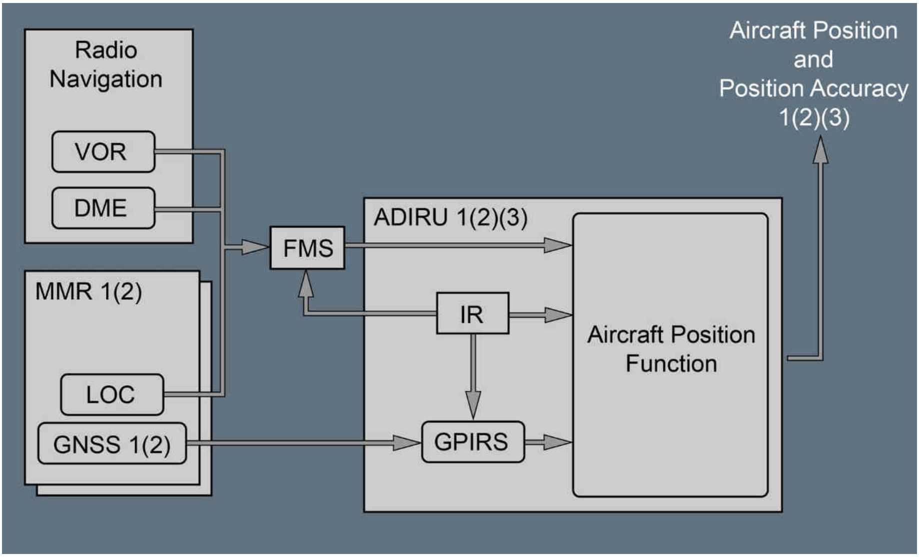
Each ADIRU computes its own aircraft position, and the associated position accuracy, with the three following sources:
- The IRs
- The GNSS
- The radio navaids (VOR, DME, LOC).

L2 The ADIRS provides the following parameters:
- Position (latitude and longitude)
- North-South and East-West horizontal speeds and accelerations
- True track angle
- Ground speed
- Time (*Refer to Time Function*)
- Position accuracy (*Refer to DSC-34-NAV-20-10-60 Position Accuracy and Navigation Accuracy*).

L1 The aircraft position function of each ADIRU provides the aircraft systems with the most accurate position that is available, using the following priority:
- The consolidated GPIRS position
- Its own GPIRS position
- The IR/radio position
  The FMS provides the IR/radio position
- Its own IR position.

L2 ADIRU 1 provides the aircraft position to FMS 1, and ADIRU 2 provides the aircraft position to FMS 2

Aircraft Position



Radio Navigation

DME
MMR 1(2)
LOC
GNSS 1(2)
FMS
ADIRU 1(2)(3)
IR
GPIRS
Aircraft Position Function
Aircraft Position and Position Accuracy 1(2)(3)

L1 GPIRS AND CONSOLIDATED GPIRS POSITION

When the GNSS data is available, each ADIRU uses the GNSS and the IR sources to compute an aircraft position. This hybrid position, that includes the GNSS position and of IR position, is referred to as the GPIRS position.
When the GPIRS positions from the three ADIRUs are available, the ADIRS provides a consolidated GPIRS position.

L2 The ADIRS compares the three GPIRS positions, and selects the most accurate position to be the consolidated GPIRS position.

L1 IR/RADIO POSITION

The FMS computes a position based on all the available IRs sources, and on the available radio navaids. This position, that includes the IRs positions and the radio position, is referred to as the IR/radio position.

L2 If the GNSS data is not available, or is deselected via the MFD, each ADIRU provides the IR/radio position from the FMS.

L1 IR POSITION

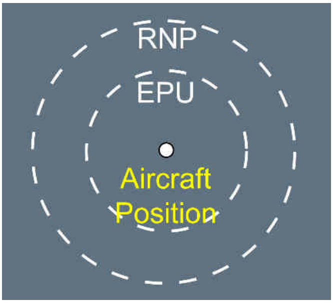
Each ADIRU computes a position based only on its IR source, referred to as the IR position.

L2 If the GNSS, the radio navaids and one IR data are not available, each remaining ADIRU provides its IR position.

POSITION ACCURACY AND NAVIGATION ACCURACY

Ident.: DSC-34-NAV-20-10-60-00016348.0001001 / 03 AUG 16
Applicable to: ALL

EPU - RNP



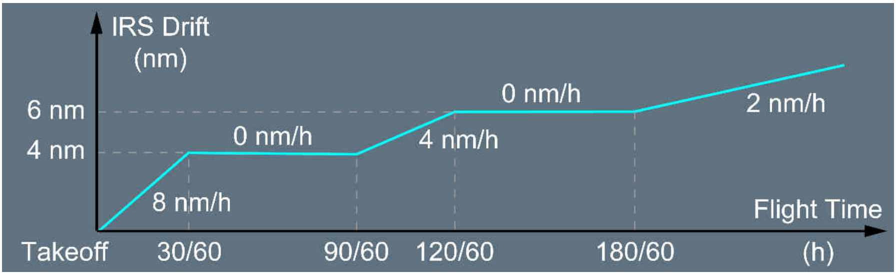
ESTIMATED POSITION UNCERTAINTY (EPU)

Each ADIRU continuously computes the Estimated Position Uncertainty (EPU) that is related to the computed aircraft position.

L2 The EPU corresponds to the radius (in nautical miles) of the circle around the computed aircraft position in which the real aircraft position is during 95 % of the time.

L3 Each ADIRU provides the position with the best EPU to the other aircraft systems.

L2 When the aircraft position is based only on IRs, the figure shows the mean inertial EPU evolution:



L1 REQUIRED NAVIGATION PERFORMANCE (RNP)

The FMS uses the RNP value, together with the EPU, to define the navigation accuracy.
The FMS has a default RNP value.

L2 The following table indicates the FMS-default RNP values:

Flight segment	FMS - default RNP
En route and oceanic	2 NM
Terminal and takeoff	1 NM
Approach	GPS and RNAV 0.3 NM Other cases 0.5 NM

L1 A terminal area procedure may have an associated specific RNP value, defined in the navigation database. If this procedure is entered, this RNP value overwrites the default FMS value.
The flight crew can manually overwrite the FMS default or terminal area procedure value.

L2 When the flight crew enters an RNP value that is more than the existing navigation database value, the PROC RNP IS XX.XX message appears on the MFD (in the FMS message area). If there is no navigation database value and the flight crew-entered value is more than the area default value, the AREA RNP IS XX.XX message appears on the MFD (in the FMS message area).
Both messages can also appear, if the navigation database value or area default value becomes less than the flight crew-entered value, when the flight area changes.

Note: The RNP shall be in accordance with the specified RNP values of the navigation and approach charts (if an RNP is specified).

L1 EVALUATION OF NAVIGATION ACCURACY

NAVIGATION ACCURACY: HIGH, LOW

The FMS continuously compares the current EPU from the ADIRS with the current RNP, and defines the navigation accuracy as:
- HIGH, if the EPU is less than or equal to the RNP
- LOW, if the EPU is more than the RNP.

L2 If the navigation mode is not IRS/GNSS:
- The NAV ACCUR DOWNGRADED message will appear on the MFD (in the FMS message area) and on the ND, when the navigation accuracy changes from HIGH to LOW
- The NAV ACCUR UPGRADED message will appear on the MFD (in the FMS message area) and on the ND, when the navigation accuracy changes from LOW to HIGH.

L1 NAV PRIMARY

The aircraft is in NAV PRIMARY, when the two following conditions are satisfied:
- The navigation mode is IRS/GNSS, and
- The navigation accuracy is HIGH.

If at least one of the two above-listed conditions is no longer satisfied, the aircraft is no longer in NAV PRIMARY: The NAV PRIMARY LOST message appears on the MFD (in the FMS message area) and on the ND. When this message appears, the automatic position reporting of the ADS-B function is lost.

Note: During a non-precision approach that is flown with the FLS function, the NAV PRIMARY LOST condition degrades the FLS capability. The triple-click audio indicator sounds.

When both above-listed conditions are satisfied again, the NAV PRIMARY message appears on the MFD (in the FMS message area) and on the ND.

CONTROLS AND INDICATORS

On the MFD, the FMS POSITION/MONITOR page displays the RNP, the EPU, and the NAV PRIMARY status.

Note: The MFD POSITION/MONITOR page also displays the navigation accuracy, if the aircraft is in NAV PRIMARY LOST.

NAVIGATION MODES

Ident.: DSC-34-NAV-20-10-60-00016528.0001001 / 06 AUG 14
Applicable to: ALL

The ADIRS determines the navigation mode.
The navigation mode depends on the sources that the ADIRS uses for the aircraft position computation.

L2 For more information about the computation of the aircraft position, *Refer to DSC-34-NAV-20-10-60 Position Computation*

L1 The navigation mode is displayed on the FMS POSITION/MONITOR page of the MFD.

L2 For more information about the FMS POSITION/MONITOR page, *Refer to DSC-34-NAV-20-20 MFD*

L1

Navigation mode	Aircraft position
3 IRS/GNSS	Consolidated GPIRS.
1 IRS/GNSS	GPIRS from one ADIRU.
1(3) IRS/DME/DME 1(3) IRS/VOR/DME 1(3) IRS/LOC 1(3) IRS/DME/LOC 1(3) IRS/VOR/LOC	IR/radio position from the FMS.
3 IRS	IR/radio position from the FMS, with no radio navaids available.
1 IRS	IR position from one ADIRU.

Time Function

TIME FUNCTION

Ident.: DSC-34-NAV-20-10-70-00012086.0001001 / 06 AUG 14
Applicable to: ALL

The time function of the ADIRS provides the aircraft time reference (UTC time and date) to the other aircraft systems.

L3 Each IR hosts the time function.

L1 The permanent data displays the UTC time. In addition, the permanent data can display the date.
The flight crew selects the data to be displayed on the permanent data via the PERM DATA SETUP list on the FMS POSITION/TIME page of the MFD.
The time function can operate either in AUTO mode or in MANUAL mode.
The AUTO mode is the default mode of operation. The flight crew can change the mode of operation via the ACFT TIME REF option list on the FMS POSITION/TIME page of the MFD.

L2 For more information about the FMS POSITION/TIME page on the MFD, *Refer to DSC-22-FMS-20-20-20 POSITION/TIME Page*.

L1 AUTO MODE

In AUTO mode, the ADIRS provide the aircraft time reference from the GNSS data, if available.
If the GNSS data is not available, the three ADIRUs provide a time reference based on their internal clock. The ADIRUs use the last valid data of the GNSS to initialize their own internal clock.

L2 If the GNSS data becomes available again, the ADIRS will provide the GNSS time reference.

L1 MANUAL MODE

In MANUAL mode, the ADIRUs provides the aircraft time reference from their own internal clock. The ADIRUs use the time data entered by the flight crew to initialize their own internal clock. The flight crew enters the time data on the FMS POSITION/TIME page of the MFD.

L2 If the time function is in MANUAL mode and the GNSS data is available, the MFD displays the CHECK TIME REF message in the FMS message area.

L1 *Note:* *The ATC datalink applications are degraded if the time function is in MANUAL mode. For more information, Refer to DSC-46-ATC-30 Manual Time Setting.*
The RNP capability is downgraded if the time function is in MANUAL mode.

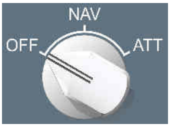
IR1(2)(3) MODE SELECTOR



ADIRU 1(2)(3) is not energized.
Both the IR 1(2)(3) data and the ADR 1(2)(3) data are not available.

IR 1(2)(3) operates in NAV mode.
IR 1(2)(3) provides full inertial data to the aircraft systems.

Note: *ADR 1(2)(3) provides full air data to the aircraft systems.*

L12

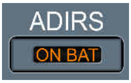
IR 1(2)(3) operates in ATT mode.
IR 1(2)(3) only provides attitude and heading data (if entered by the flight crew). The navigation data are not available.
For more information about the ATT mode, *Refer to DSC-34-NAV-20-10-40 IR Modes*.

Note: *ADR 1(2)(3) provides full air data to the aircraft systems.*

Ident.: DSC-34-NAV-20-20-10-00012088.0001001 / 06 AUG 14

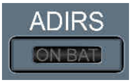
ON BAT LIGHT

L12



Batteries supply at least one ADIRU.

Note: *When the aircraft is on the ground, if at least one ADIRU is supplied by the aircraft batteries, an external horn sounds.*

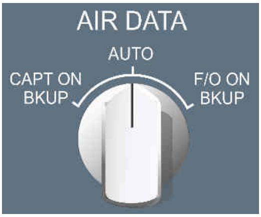


One of the following applies:
- All three ADIRUs are on, and not supplied by batteries, or
- All three ADIRUs are off.

AIR DATA SELECTOR

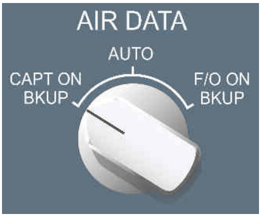
Ident.: DSC-34-NAV-20-20-00003290.0001001 / 06 AUG 14
Applicable to: ALL

L12



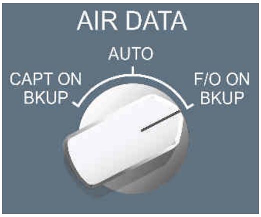
The CDS automatically reconfigures the PFD based on the availability of the air data sources.
For more information, *Refer to DSC-34-NAV-20-10-30 Air Data Source & Display Reconfiguration*.

L12



The PRIMs provide the backup speed and altitude (computed from FADEC data) to the PFD of the Captain. This only changes the air data used for associated PFD and has no effect on the air data used for flight control law.
The CAPT ON BKUP memo appears on the WD.
If the flight crew has selected AP 1, the NAV CAPT PFD ON BKUP alert is displayed on the WD.
For more information about the NAV CAPT PFD ON BKUP alert, *Refer to PRO-ABN-NAV NAV CAPT(F/O) PFD ON BKUP*.
This selector position may be used for the NAV UNRELIABLE AIR SPEED INDICATION, *Refer to PRO-ABN-NAV [ABN] NAV UNRELIABLE AIR SPEED INDICATION*.

L12



The PRIMs provide the backup speed and altitude (computed from FADEC data) to the PFD of the First Officer. This only changes the air data used for associated PFD and has no effect on the air data used for flight control law.

The F/O ON BKUP memo appears on the WD.

If the flight crew has selected AP 2, the NAV F/O PFD ON BKUP alert is displayed on the WD.

For more information about the NAV F/O PFD ON BKUP alert, *Refer to PRO-ABN-NAV NAV CAPT(F/O) PFD ON BKUP*.

This selector position may be used for the NAV UNRELIABLE AIR SPEED INDICATION, *Refer to PRO-ABN-NAV [ABN] NAV UNRELIABLE AIR SPEED INDICATION*.

L2 For more information about the backup speed and altitude indications on the PFD, *Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.

ISIS

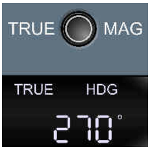
The window displays the HDG/TRK based on the magnetic north reference.
When pressed, the North reference changes to the TRUE north reference.



The window displayed the HDG/TRK based on the TRUE north reference.
When pressed, the north reference changes to the magnetic north reference.

The north reference is magnetic, unless the aircraft is in the polar zone.

When the aircraft reaches the polar zone:
- The following messages ask the flight crew to change from the magnetic reference to the TRUE north reference:
  - The SELECT TRUE NORTH REF memo appears on the ND
  - The NAV EXTREME LATITUDE triggers.
- The north reference automatically changes to TRUE in the ADIRS.

ATT ONLY OPERATION

Ident.: DSC-34-NAV-20-30-00003298.0001001 / 06 AUG 14
Applicable to: ALL

In the case of a short power shutdown of an ADIRU, or an IR failure, the NAV mode is lost. However, the ATT mode will probably be available.
The NAV IR 1(2)(3) FAULT abnormal sensed procedure (*Refer to procedure*) and the NAV IR ALIGNMENT IN ATT MODE abnormal not-sensed procedure (*Refer to procedure*) provide the applicable procedure to try to recover the ATT mode.

DISPLAY OF ISIS INERTIAL DATA

Ident.: DSC-34-NAV-20-30-00020099.0001001 / 06 NOV 14
Applicable to: ALL

USE OF ISIS INERTIAL DATA

The PFDs display the ISIS inertial data, when the automatic monitoring of inertial data (by the PRIMs and the ADIRS) rejects the inertial data of the three IRs.

L2 For more information about the ADIRS monitoring, *Refer to DSC-34-NAV-20-10-50 ADIRS Monitoring*.

L1 The flight controls are in direct law.

L2 For more information about the direct law, *Refer to PRO-ABN-F_CTL F/CTL DIRECT LAW (PROT LOST)*.

BACKUP SPEED AND BACKUP ALTITUDE INDICATIONS

Ident.: DSC-34-NAV-20-30-00020096.0001001 / 08 JUL 19
Applicable to: ALL

USE OF BACKUP INDICATIONS

The PFDs displays the backup speed indication or backup altitude indication (from the FADECs and AOA probes), when:

- The automatic monitoring of air data (by the PRIMs and the ADIRS) rejects the three ADRs and the ISIS air data. The flight controls are in direct law.

  L2 For more information about the ADIRS monitoring, *Refer to DSC-34-NAV-20-10-50 ADIRS Monitoring*.

  For more information about the direct law, *Refer to PRO-ABN-F_CTL F/CTL DIRECT LAW (PROT LOST)*.

- L1 The flight crew detects an unreliable air data indication. The flight crew must apply the NAV UNRELIABLE AIR SPEED INDICATION abnormal not-sensed procedure. This procedure enables to manually select the display of the backup speed and backup altitude indications. As a consequence:

  - The flight controls are in alternate law, if all ADRs are set to OFF and the ISIS is operative.

    L2 For more information about the procedure, *Refer to PRO-ABN-NAV [ABN] NAV UNRELIABLE AIR SPEED INDICATION*.

    For more information about the alternate law, *Refer to PRO-ABN-F_CTL F/CTL ALTN LAW (PROT LOST)*.

  - L1 The flight controls are in direct law, if all ADRs are set to OFF and the ISIS is failed or rejected by the PRIMs.

    L2 For more information about the procedure, *Refer to PRO-ABN-NAV [ABN] NAV UNRELIABLE AIR SPEED INDICATION*.

    For more information about the direct law, *Refer to PRO-ABN-F_CTL F/CTL DIRECT LAW (PROT LOST)*.

L1 *Note:* *On ground, at low speed (below 60 kt), the backup speed indication freezes as the backup speed accuracy is too low.*

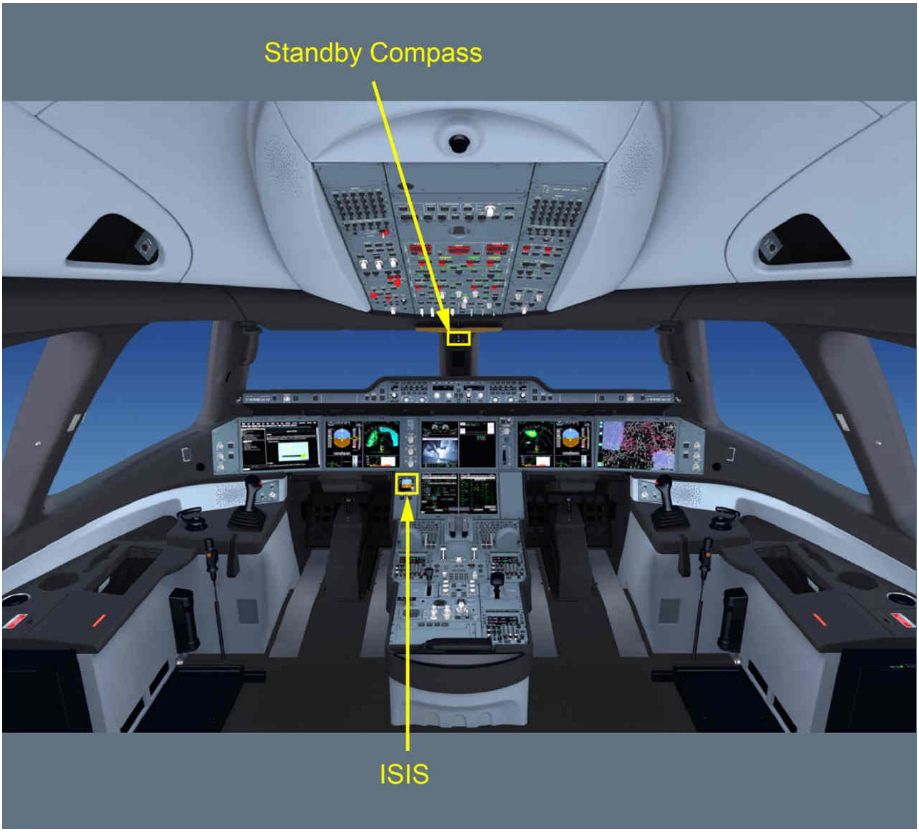
OVERVIEW

Ident.: DSC-34-NAV-30-10-00003127.0001001 / 01 JUL 14
Applicable to: ALL

The standby instruments include:
- One Integrated Standby Instrument System (ISIS)
- One standby compass.

In addition to the PFD and the ND, the ISIS provides an independent source of information for:
- Air data and inertial reference parameters (e.g. altitude, attitude, airspeed, etc.)
- Navigation information.

Cockpit view



The ISIS displays a Standby Flight Display (SFD).

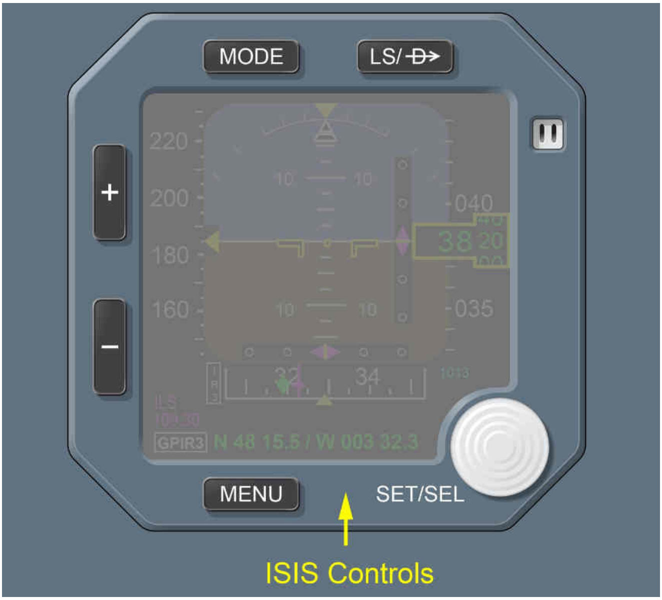
The ISIS is connected to three independent probes:

- One standby pitot probe
- Two standby static probes.

The ISIS includes its own controls.

ISIS Controls



The standby compass provides the magnetic heading of the aircraft.

L2 For more information about the standby compass, *Refer to DSC-34-NAV-30-50 Standby Compass*

INTEGRATED STANDBY INSTRUMENT SYSTEM (ISIS)

There are two ISIS, one displays a SFD and one displays a SND ⪡ .
Each ISIS can operate in any mode. However, one SFD is always displayed.
They are on both sides of the main instrument panel.

L3 The ISIS includes the following elements:

- Internal gyrometers and accelerometers that compute and display aircraft attitude
- Segregated standby probes that measure total pressure and static pressure.
  Each ISIS uses these air data parameters in order to compute and display aircraft altitude, and indicated airspeed.

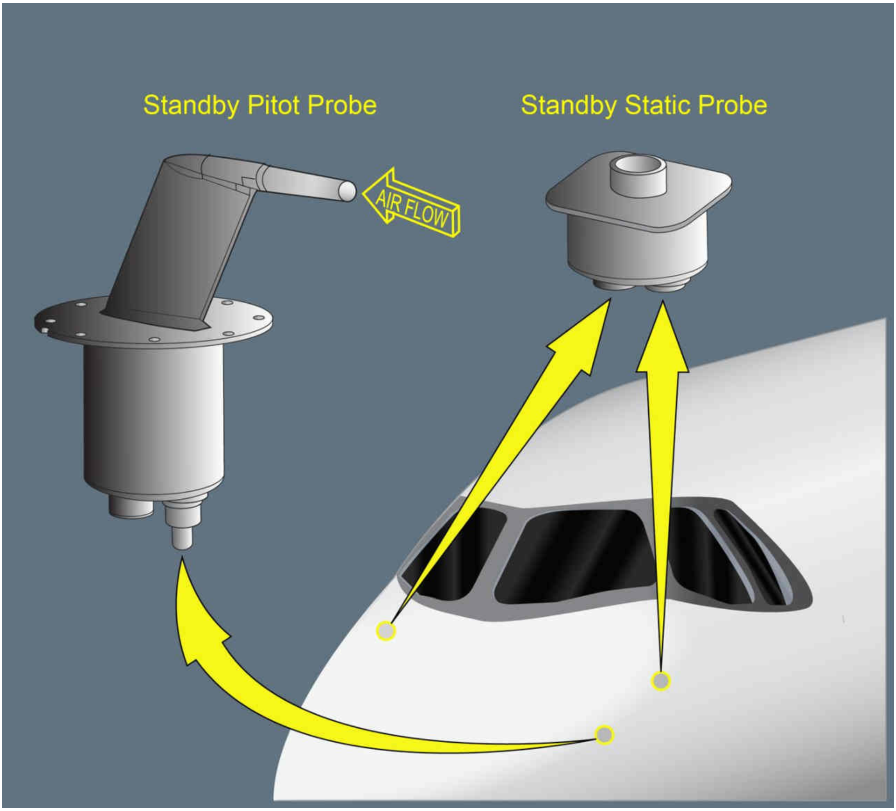
Ident.: DSC-34-NAV-30-20-10-00003133.0001001 / 01 JUL 14

ISIS PROBES

The ISIS uses three dedicated probes that are independent of the ADIRS probes:

- One pitot probe on the left side of the fuselage
- Two static probes, one probe on each side of the fuselage.

ISIS Probes



L3 The standby static probes also provide the static pressure to the following equipment:
- The Cabin Pressure Control System (CPCS)
- The Doors and Slides Control System (DSCS).

Ident.: DSC-34-NAV-30-20-10-00003129.0001001 / 01 JUL 14

MMR 1

MMR 1 provides GNSS and LS data to the ISIS.

L3 The ISIS receives the following data from MMR 1:
- LS data:
  - LS source
  - LOC and GLIDE deviations
  - Associated identifier and frequency
  - Selected course
- GNSS data
  - Ground speed
  - Latitude and longitude
  - True track.

Ident.: DSC-34-NAV-30-20-10-00003130.0001001 / 01 JUL 14

ADIRS

ADIRUs 1 and 3 provide navigation information to the ISIS.

L3 The ISIS receives the following information from the ADIRUs:
- Magnetic and the true heading
- True track
- Ground speed
- Latitude and longitude

Ident.: DSC-34-NAV-30-20-10-00003131.0001001 / 06 NOV 14

PRIMs

The ISIS provides the PRIMs with air data and inertial reference parameters.

L2 The PRIMs use the air data and the inertial reference parameters from the ISIS in order to monitor the ADIRS.

For more information about the PRIMs monitoring of the ADIRS, *Refer to DSC-34-NAV-20-10-50 ADIRS Monitoring*.

Ident.: DSC-34-NAV-30-20-10-00003135.0001001 / 01 JUL 14

STANDBY COMPASS

There is one standby compass on the top of the windshield center post.

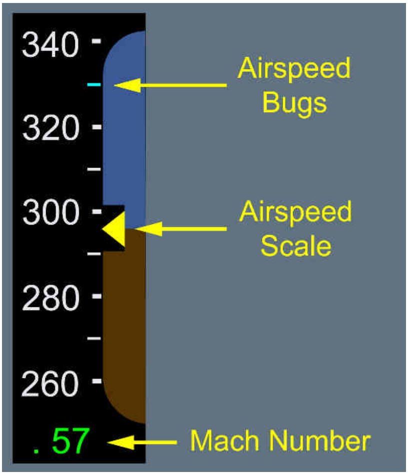
AIRSPEED

Applicable to: ALL

Ident.: DSC-34-NAV-30-30-10-00003143.0001001 / 01 JUL 14

Airspeed Indications



Ident.: DSC-34-NAV-30-30-10-00003145.0001001 / 01 JUL 14

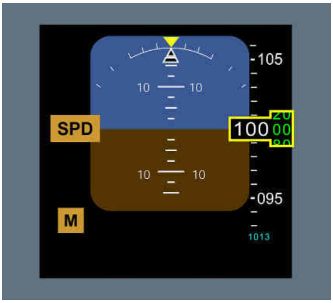
AIRSPEED SCALE

A white scale moves in front of a fixed yellow triangle that indicates the airspeed.

L2 The airspeed scale has markers every 5 kt, from 30 kt to 250 kt, and every 10 kt, from 250 kt to 520 kt. There are digital markers every 20 kt.

L1 **SPD**	Appears instead of the airspeed scale if the airspeed data is not available.

Speed Flags on the SFD



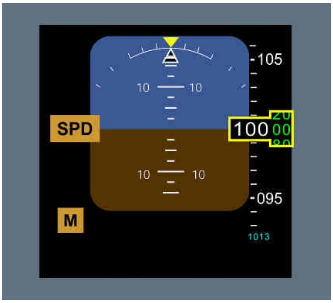
Ident.: DSC-34-NAV-30-30-10-00003146.0001001 / 01 JUL 14

MACH NUMBER

The Mach number appears in green in the left bottom part of the SFD.
The Mach number appears when it goes above M 0.50, and then disappears if it goes below M 0.45

M	Appears instead of the Mach number indications when the Mach data is not available.

Speed Flags on the SFD



Ident.: DSC-34-NAV-30-30-10-00003147.0001001 / 01 JUL 14

AIRSPEED BUGS

When the flight crew sets an airspeed bug, the corresponding blue line appears on the airspeed scale.
No bug appears if the flight crew enters an airspeed bug value that goes above or below the airspeed scale.
Two airspeed bugs can be displayed at the same time.

L2 The airspeed bugs can be set every 1 kt, from 100 kt to 520 kt.

L1 The flight crew sets an airspeed bug via the MENU/SET SPD BUG 1(2) function.

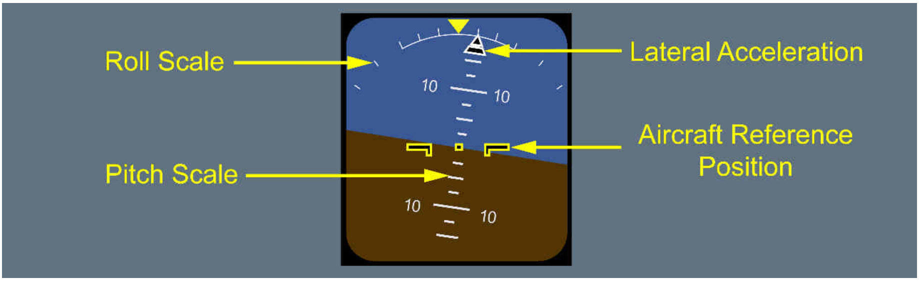
L2 For more information about SFD menu, *Refer to DSC-34-NAV-30-60 MENU pb*.

ATTITUDE

Applicable to: ALL

Ident.: DSC-34-NAV-30-30-20-00003148.0001001 / 06 NOV 14

Attitude Indications



Ident.: DSC-34-NAV-30-30-20-00003150.0001001 / 01 JUL 14

AIRCRAFT REFERENCE POSITION

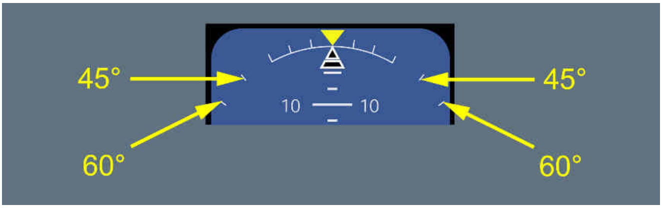
A fixed black symbol with a yellow frame indicates the fixed reference position of the aircraft.

Ident.: DSC-34-NAV-30-30-20-00003151.0001001 / 03 JAN 20

ROLL SCALE

The roll scale indicates the bank angle of the aircraft.
The roll index, displayed as a black triangle, indicates the current aircraft bank angle.

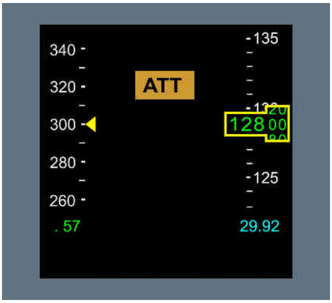
L2 The scale has markers at 0 °,10 °, 20 °, 30 °, 45 °, and 60 ° of bank.



L1 *Note:* *In the case of a long turn at a small bank angle (less than 5 °), the displayed roll attitude may temporary be incorrect by few degrees.*

ATT Appears instead of the attitude indicator if the attitude data is not available.

ATT Flag on the SFD



Ident.: DSC-34-NAV-30-30-20-00003152.0001001 / 06 NOV 14

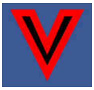
PITCH SCALE

The pitch scale indicates the pitch angle of the aircraft.

L2 The scale has markers:

- Every 10 °, below -30 ° and above 30 °
- Every 2.5 °, between -30 ° and 30 °.

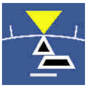
L12



Indicates an excessive pitch angle of the aircraft, and shows the direction to reduce it.
This symbol appears if the pitch angle goes above 30 ° or below -30 °.

Ident.: DSC-34-NAV-30-30-20-00003153.0001001 / 06 NOV 14

LATERAL ACCELERATION



Indicates the lateral acceleration of the aircraft.

ALTITUDE

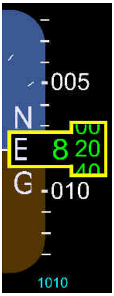
ALTITUDE INDICATION

A green digital indication enclosed in yellow indicates the altitude on a white moving scale.

L2 The altitude scale has markers every 100 ft from -2 000 ft to 50 000 ft, with digital markers every 500 ft.

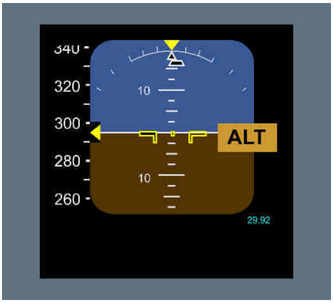
L1



When the altitude is negative, "NEG" appears on the left of the altitude scale

Replaces the altitude scale when the altitude data is not available.

ALT Flag on the SFD



Ident.: DSC-34-NAV-30-30-30-00003156.0001001 / 01 JUL 14

ALTITUDE IN METERS

The current altitude can also be displayed in meters.
The display is activated via the MENU/DISPLAY METERS function.

L2 For more information about the SFD menu, *Refer to DSC-34-NAV-30-60 MENU pb*.

Ident.: DSC-34-NAV-30-30-30-00003157.0001001 / 01 JUL 14

BAROMETRIC REFERENCE

L12

The barometric reference pressure is in hectopascals (hPa).
The barometric pressure display goes from 745 hPa to 1 100 hPa.

L12

The barometric reference pressure is in inches of mercury (inHg).
The barometric pressure display goes from 22 inHg to 32.48 inHg.

The barometric pressure is standard.

The display is activated using the MENU/SET BARO UNIT function.

L2 For more information about the SFD menu, *Refer to DSC-34-NAV-30-80 How to use the MENU pb in SFD mode*.

Ident.: DSC-34-NAV-30-30-30-00003158.0001001 / 01 JUL 14

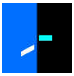
ALTITUDE BUG

When the flight crew enters an altitude bug, the corresponding bug appears in blue on the altitude scale.

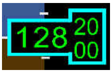
Only one altitude bug can be displayed.

L2 The altitude bug can be set every 100 ft, from 100 ft to 50 000 ft.

L1



When the flight crew enters an altitude bug, the corresponding blue line is displayed on the altitude scale.



When the altitude bug is set at the current aircraft altitude, the current altitude is enclosed in blue.

When the altitude bug is set in front of a digital marker, the altitude bug is indicated by a blue box.

The flight crew enters an altitude bug via the MENU/SET ALT BUG function.

L2 For more information about the SFD menu, *Refer to DSC-34-NAV-30-80 How to use the MENU pb in SFD mode*.

HEADING SCALE

The heading scale is displayed when the flight crew selects the display of:

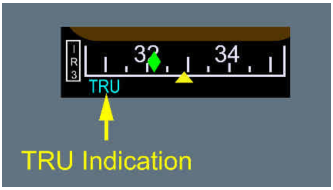
- The approach information, via the LS/DIR TO pb (*Refer to DSC-34-NAV-30-30 Approach*), or
- The NAV information, via the DISPLAY NAV menu item in the SFD menu (*Refer to DSC-34-NAV-30-60 MENU pb*), or
- The FIX information, via the DISPLAY FIX menu item in the SFD menu (*Refer to DSC-34-NAV-30-60 MENU pb*).

L2 The heading scale has markers every 5 ° with digital markers every 20 °.

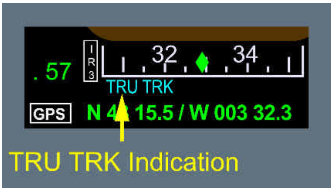
Ident.: DSC-34-NAV-30-30-50-00003167.0001001 / 01 JUL 14

AIRCRAFT HEADING AND AIRCRAFT TRACK

The heading scale indicates the aircraft heading and the aircraft track.
The current aircraft heading is indicated with a yellow triangle in the middle of the heading scale.
The current aircraft track is indicated with a green diamond on the heading scale.



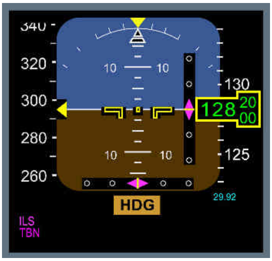
When the flight crew presses the TRUE/MAG pb on the AFS CP, MAG heading and MAG track revert to TRUE heading and TRUE track.



When the TRUE heading is not available or invalid, the TRUE track shall be displayed.

When heading and track data are not available, the HDG flag replaces the heading scale.

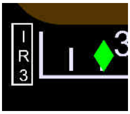
HDG Flag on the SFD



Ident.: DSC-34-NAV-30-30-50-00003168.0001001 / 01 JUL 14

HEADING SOURCE

The source of the current aircraft heading is displayed on the left hand of the heading scale. The source can be either ADIRU 1 or ADIRU 3.



The heading source is ADIRU 3.

Ident.: DSC-34-NAV-30-30-50-00003169.0001001 / 01 JUL 14

FIX INDICATIONS

The FIX indications include:
- The FIX bearing indicated with an empty blue diamond on the heading scale
- The FIX bearing/distance values indicated in blue under the heading scale.

If a **T** follows the FIX bearing, the FIX bearing is true.

The FIX indications are not available.

L2 If the distance between the aircraft and the FIX is more than 20 NM, the distance is displayed without decimal. If the distance between the aircraft and the FIX is less than 20 NM, the distance is displayed with one decimal.

L1 The FIX indications are displayed via the MENU/DISPLAY FIX function.

L2 For more information about the SFD menu, *Refer to DSC-34-NAV-30-60 MENU pb*

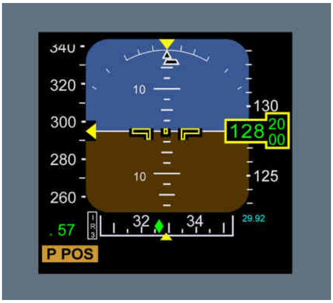
Ident.: DSC-34-NAV-30-30-50-00003170.0001001 / 01 JUL 14

AIRCRAFT POSITION

The aircraft position and the aircraft position source are displayed when the flight crew selects the display of the NAV information via the DISPLAY NAV item in the SFD menu (*Refer to DSC-34-NAV-30-60 MENU pb*).

 GPIR3 N 48 15.5 / W 003 32.3	The aircraft position in latitude/longitude.
 IR1 ------/------	The aircraft position is not available.
 PPOS	Appears when the aircraft position is not valid.

PPOS Flag on the SFD



L2 The ADIRS and the MMR 1 provide the aircraft position source in the following order or priority:
- GPIRS computed by the ADIRS (coming from ADIRU 3 then ADIRU 1)
- GNSS computed by the MMR 1 (coming from MMR 1, then ADIRU 3, then ADIRU 1)
- IRS computed by the ADIRS (coming from ADIRU 3 then ADIRU 1).

L1

 GPIR3	The aircraft position comes from the ADIRU 3, and is computed from the GNSS and IRS 3 position.
 GPS1	The aircraft position comes from the MMR 1.
 GPS	The aircraft position comes from the ADIRU 3 or the ADIRU 1, and is computed from the GNSS position.
 IR3	The aircraft position comes from the ADIRU 3.

MENU PB

When pressed, the first item of the SFD menu is displayed.

The content of the SFD menu is as follows:
- SET SPD BUG 1 and SET SPD BUG 2 to adjust, and display the speed bugs
- SET ALT BUG to adjust, and display an altimeter bug
- DISPLAY METERS to display aircraft altitude in meters, in addition to the altitude in ft
- SET BARO UNIT to change the barometric pressure from hPa to inHg
- DISPLAY NAV to display the aircraft position, heading, and track
- DISPLAY FIX to modify and display a FIX
- MAINTENANCE, displayed on ground for maintenance purposes only.

L2 The DISPLAY METERS, the DISPLAY NAV, and the DISPLAY FIX items are exclusive and cannot be displayed at the same time. As soon as one item is activated, the two others are set automatically to off if they were previously displayed.
For more information about the use of the SFD menu, *Refer to DSC-34-NAV-30-80 How to use the MENU pb in SFD mode*.

L1 The MENU pb enables an ISIS reset in some cases.

L2 For more information about the ISIS reset, *Refer to DSC-34-NAV-30-70 Manual or Automatic Attitude Reset*.

Ident.: DSC-34-NAV-30-60-10-00003140.0001001 / 01 JUL 14

SET/SEL KNOB

Enables the flight crew to change barometric reference and to navigate in the menu.

L2 For more information about the use of the SET/SEL knob in SFD mode, *Refer to DSC-34-NAV-30-80 How to use the SET/SEL knob in SFD mode*.

Ident.: DSC-34-NAV-30-60-10-00003141.0001001 / 01 JUL 14

BRIGHTNESS PB

A photosensitive cell installed on the right surface of the ISIS automatically adjusts the screen brightness when the ISIS is set to ON.
The "+" and "-" pushbuttons enable manual adjustment of the level of brightness.

TRUE/MAG PB

Ident.: DSC-34-NAV-30-60-00003134.0001001 / 01 JUL 14
Applicable to: ALL

The selection of true or magnetic reference via the TRUE/MAG pb modifies the ISIS display.
L2 For more information about the TRUE/MAG pb, *Refer to DSC-34-NAV-20-20 AFS CP*.

Intentionally left blank

MANUAL OR AUTOMATIC ATTITUDE RESET

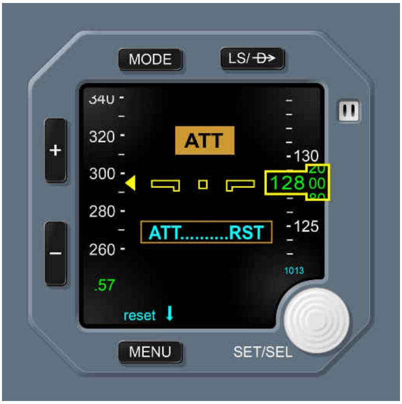
Ident.: DSC-34-NAV-30-70-00003253.0001001 / 01 JUL 14
Applicable to: ALL

MANUAL ATTITUDE RESET

In some cases, a manual attitude reset of the ISIS is required.

L2 A manual attitude reset must be performed in case of:
- 350 h of continuous electrical supply, or
- Excessive aircraft motion during the alignment phase, or
- Failed automatic attitude reset.

L1 In that case, the following messages appear on the SFD:



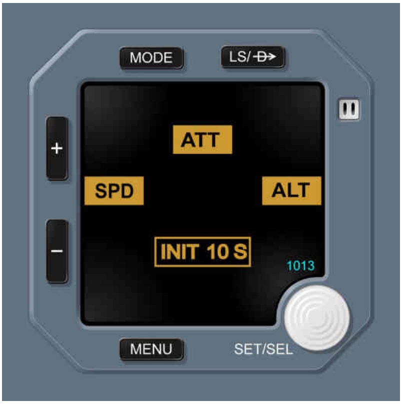
ATT

ATT..........RST

The flight crew must press the MENU pb to initiate the reset. The reset lasts approximately 10 s. During the reset procedure, the aircraft must be stabilized (with wings held level and no acceleration).

During the reset sequence, the SFD displays:

- On ground, the initialization page:



MODE

GENERAL

Ident.: DSC-34-NAV-40-00003320.0001001 / 03 SEP 14
Applicable to: ALL

The Global Navigation Satellite System (GNSS) is a navigation system that uses satellite signals.

L2 GNSS is a general term for satellite navigation systems, and includes for example:
- Global Positioning System (GPS)
- Global Orbiting Navigation Satellite System (GLONASS)
- Regional Satellite Based Augmentation System (SBAS) such as Wide Area Augmentation System (WAAS)

Note: *GPS is the only GNSS satellite navigation system that ADIRS consider to compute the aircraft position.*

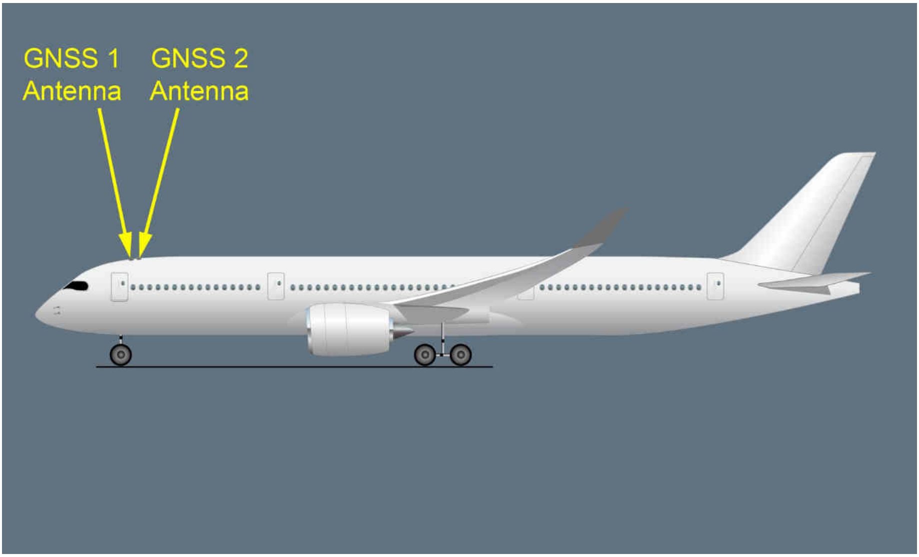
L1 The GNSS provides an independent source for:
- The position
- The speed
- The altitude
- The true track
- The time data.

The aircraft has two independent GNSS antennas.

Each GNSS has a dedicated GNSS receiver and GNSS antenna:
- GNSS 1 has a GNSS 1 receiver in Multi-Mode Receiver (MMR) 1 and a GNSS 1 antenna
- GNSS 2 has a GNSS 2 in receiver in MMR 2 and a GNSS 2 antenna.

The GNSS antennas are installed on top of the fuselage.
Each GNSS antenna receives GNSS signals from the GNSS constellation.

GNSS Antennas



GNSS 1 Antenna
GNSS 2 Antenna

L2 The MMRs send the GNSS data to:

GNSS DATA TO ADIRS

Ident.: DSC-34-NAV-40-00003321.0001001 / 23 APR 14
Applicable to: ALL

Each MMR is connected to each ADIRU.

L2 The ADIRS uses:

- The GNSS data to compute an hybrid GPIRS position between the IR and the GNSS data
  For more information about the computation of the aircraft position, *Refer to DSC-34-NAV-20-10-60 Position Computation*.
- The GNSS navigation data, and the GNSS UTC time for ADIRS initialization.

The ADIRS also sends the GNSS data to the DFDR, the CDS, the FWS, the SURV, the FMS, the PCS, the ISIS, and the ATC.

GNSS DATA TO ISIS

Ident.: DSC-34-NAV-40-00003323.0001001 / 06 NOV 14
Applicable to: ALL

The MMRs send the GNSS data to ISIS.

L2 The ISIS displays the aircraft position on the SFD.
The displayed position comes from ADIRU 1 or 3 (the GPIRS, or the GNSS, or the IRS position), or MMR 1 (the GNSS position) in accordance with the ISIS internal logic.
For more information about the aircraft position on the ISIS SFD, *Refer to DSC-34-NAV-30-30 Aircraft Position*.

GNSS MODES

Ident.: DSC-34-NAV-40-00017175.0001001 / 22 NOV 17
Applicable to: ALL

The GNSS can operate in the following modes:

- The initialization (INIT) mode

L3 The INIT mode is associated with the GNSS initialization. GNSS initialization begins at power-up, and ends when the GNSS begins the satellite acquisition process.

L1 - The acquisition (ACQ) mode

L3 The ACQ mode enables the search of the satellites. The GNSS initiates this mode after INIT mode, or after a long period of satellite signal loss. The GNSS remains in this mode, until the GNSS is able to be connected with at least four satellites.
As soon as four satellites are connected, the navigation (NAV) mode becomes active. The ACQ mode can become active when the GNSS is in the NAV, the DIRSPDAID, the ALTAID, or the SBAS NAV mode.

L1 - The NAV GPS mode

L3 The NAV mode is only based on the GPS data. This mode provides the GPS measurement and navigation data. This mode is the primary navigation mode for the en route, terminal, and non-precision approach flight phases. The NAV GPS mode can become active when the GNSS is in the ACQ mode.

L1 - The NAV SBAS ◁✳ mode

L3 The NAV SBAS mode provides the GNSS measurement and navigation data that the SBAS monitors. This mode is automatically activated when the SLS ◁✳ approach is selected. The NAV SBAS mode can become active when the GNSS is in the NAV or the ACQ mode.

L1 - The altitude aiding (ALTAID) mode

L3 The ALTAID mode:
- Uses the altitude that the ADIRS provides
- Provides the GNSS measurement and navigation data.

This mode is used if the GNSS is degraded or can not connect to four satellites.

L1 - The direction/speed aiding (DIRSPDAID) mode

L3 The DIRSPDAID mode:
- Uses the ground speed, the vertical speed, and the track angle that the ADIRS provides
- Provides the GNSS measurement and navigation data.

L1 - The test (TEST) mode

L3 The TEST mode checks the status of various GNSS receiver circuits.

L1 - The fault (FAULT) mode.

L3 The FAULT mode becomes active if a failure can affect the validity of the GNSS data.

L1 These modes are indicated on the POSITION/GNSS page (*Refer to DSC-22-FMS-20-20-20 POSITION/GNSS Page*).

OVERVIEW

Ident.: DSC-34-NAV-50-00003376.0001001 / 09 MAR 16
Applicable to: ALL

The Multi-Mode Receivers (MMRs) provide the different approach modes via the following landing systems:
- The Instrument Landing System (ILS)
- The FMS Landing System (FLS)
- The mixed Localizer/FLS (LOC/FLS) system
- The GBAS Landing System (GLS) ◁
- The Satellite Landing System (SLS) ◁ .

The aircraft has two independent Landing Systems (LS) antennas:
- The Localizer/Differential Global Positioning System(LOC/DGPS) antenna that receives localizer signal, and data from the GLS ◁ ground station
- The Glide Slope (G/S) capture antenna that receives G/S signals.

Both antennas are in the radome. Each MMR uses both antennas.
L2 For more information about the GNSS antennas, *Refer to GNSS/Overview*.

ILS

Ident.: DSC-34-NAV-50-00012154.0001001 / 23 APR 14
Applicable to: ALL

The ILS enables the flight crew to perform approaches based on the vertical and lateral deviations received from the LOC and G/S ground stations.

The MMRs provide:
- The radio lateral deviation from the LOC reference
- The radio vertical deviation from the G/S reference
- The identification of the LOC and G/S ground stations.

L2 For more information about the ILS approaches, *Refer to DSC-22-FG-70-80-00 ILS Guidance Mode*.

FLS

Ident.: DSC-34-NAV-50-00012157.0001001 / 23 APR 14
Applicable to: ALL

The FLS enables the flight crew to perform non-precision approaches, in accordance with the "ILS look-alike" feature.

For FLS, the MMRs use:
- The aircraft position from the ADIRS.
- The approach database from the FMS.

The MMRs provide:

- The computed lateral deviation (pseudo LOC)
- The computed vertical deviation (pseudo G/S)
- The horizontal distance between the aircraft and the anchor point of the FLS beam.

L2 For more information about the FLS beam, *Refer to DSC-22-FMS-10-30-40 FLS Beam Computation*.

For more information about approaches with FLS, *Refer to DSC-22-FG-70-80-00 Approaches Flown with Lateral and Vertical FLS Guidance*.

LOC/FLS

Ident.: DSC-34-NAV-50-00012158.0001001 / 23 APR 14
Applicable to: ALL

The LOC/FLS enables the flight crew to perform approaches with the LOC ground station only, in accordance with the "ILS look-alike" feature.

For LOC/FLS, the MMRs use:

- The aircraft position from the ADIRS
- The signals from the LOC ground station
- The approach database from the FMS.

The MMRs provide:

- The radio lateral deviation from the LOC reference
- The computed vertical deviation (pseudo G/S)
- The identification of the LOC ground station.

L2 For more information about LOC approaches with vertical FLS guidance, *Refer to DSC-22-FG-70-80-00 Approaches Flown with Vertical FLS Guidance*.

GLS ◁

Ident.: DSC-34-NAV-50-00012159.0001001 / 09 MAR 16
Applicable to: ALL

The GLS uses the Global Navigation Satellite System (GNSS) position, with correction signal from a local ground station also known as Ground Based Augmentation System (GBAS).
The GLS enables the flight crew to fly straight-in approaches, in accordance with the "ILS look-alike" feature.

For GLS, the MMRs use:

- The aircraft position from the GNSS satellites
- The position correction from the GBAS station
- The approach database from the GBAS station.

The MMRs provide:
- The computed lateral deviation
- The computed vertical deviation
- The horizontal distance between the aircraft and the runway threshold
- The identification of the GBAS ground station.

L2 For more information about approaches with GLS, *Refer to DSC-22-FG-70-80-00 GLS Guidance Mode*.

SLS

Ident.: DSC-34-NAV-50-00012162.0001001 / 09 MAR 16
Applicable to: ALL

The SLS uses the Global Navigation Satellite System (GNSS) position, with correction signals from satellite constellations also known as Satellite Based Augmentation System (SBAS).

L3 To compute the correction signals, the SBAS geostationary satellites communicate with regional ground stations.

L1 The SLS approach enables the flight crew to fly RNAV(GNSS) straight-in approaches, in accordance with the "ILS look-alike" feature.

For SLS, the MMRs use:
- The aircraft position from the GNSS satellites
- The position correction from the SBAS geostationary satellites

L3 The MMRs can receive the SBAS signal from satellite constellations such as:
  - Wide Area Augmentation Signal (WAAS) over north America
  - European Geostationary Navigation Overlay Service (EGNOS) over Europe
  - Japanese Multi-functional Satellite Augmentation System (MSAS) over Japan

L1
- The approach database from the FMS.

The MMRs provide:
- The computed lateral deviation
- The computed vertical deviation
- The horizontal distance between the aircraft and the runway threshold.

L2 For more information about precision approaches with SLS, *Refer to DSC-22-FG-70-80-00 SLS Guidance Mode*.

CONTROLS AND INDICATORS

Ident.: DSC-34-NAV-50-10-00019676.0001001 / 23 APR 14
Applicable to: ALL

For information about the PFD, *Refer to DSC-31-CDS-40-20-110 xLS Approaches*.

Ident.: DSC-34-NAV-50-10-00019679.0001001 / 23 APR 14
Applicable to: ALL

For information about the SFD, *Refer to DSC-34-NAV-30-30 Approach*.

Ident.: DSC-34-NAV-50-10-00019678.0001001 / 23 APR 14
Applicable to: ALL

For information about the ARC mode, *Refer to DSC-31-CDS-40-40-20 ARC Mode Overview*.
For information about the ROSE-NAV mode, *Refer to DSC-31-CDS-40-40-40 ROSE-NAV Mode Overview*.
For information about the ROSE-VOR mode, *Refer to DSC-31-CDS-40-40-50 ROSE-VOR Mode Overview*.
For information about the ROSE-LS mode, *Refer to DSC-31-CDS-40-40-60 ROSE-LS Mode Overview*.

Ident.: DSC-34-NAV-50-10-00019680.0001001 / 23 APR 14
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

For information about the HUD, *Refer to DSC-31-CDS-50-30-110 xLS Approaches*.

GENERAL

Ident.: DSC-34-NAV-60-10-00003329.0001001 / 23 APR 14
Applicable to: ALL

The aircraft has three Radio Altimeters (RAs). The RAs provide the height of the aircraft above the ground mainly for:

- The display on the PFD, VD and HUD, if installed
- The auto callouts
- The autoland mode

L2 For more information about the autoland mode, *Refer to DSC-22-FG-70-110-90 ILS Approach and Autoland*.

L1 - The flight control laws

L2 For more information about the flight control system, *Refer to DSC-27-10-10 Flight Control System*.

L1 - The SURV calculation.

L2 For more information about the SURV calculation, *Refer to SURV/Overview*.

L3 The RAs operate below 5 500 ft AGL.

L1 The RA height is the minimum distance between the MLG wheels and the ground.

Antennas

RA Reception
Antenna
RA Transceiver

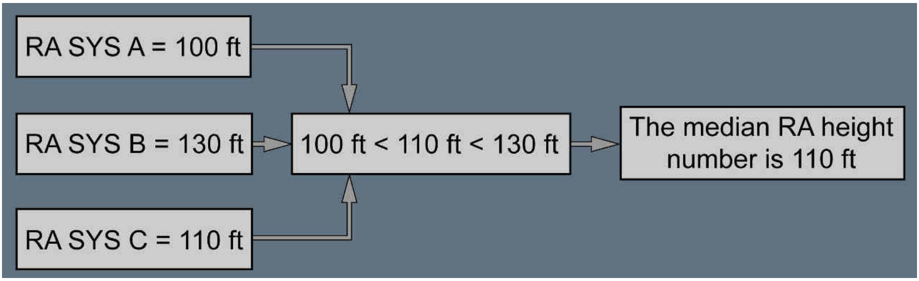
Each RA provides its RA height to the user aircraft systems.

L2 The PRIMs use the RA height for autoland warning computation, guidance and flight control laws.
For more information, *Refer to DSC-22-FG-100-20 Autoland Warning*.

The SURV system uses the RA height for:
- The PWS. For more information, *Refer to DSC-34-SURV-30-10 Predictive Windshear (PWS) Function*.
- The TCAS. For more information, *Refer to DSC-34-SURV-40-10 Principle*.
- The GPWS. For more information, *Refer to DSC-34-SURV-20-10 GPWS*.

The FWS uses the RA height in order to compute the auto callouts and the flight phases.
The CDS displays the RA height.
L1 In normal operation, the aircraft systems use the median RA height number.

Median RA Height Number



L2 Each RA has:
- One RA transceiver
- One RA transmission antenna
- One RA reception antenna.

AUTO CALLOUTS

Applicable to: ALL

Ident.: DSC-34-NAV-60-10-10-00015970.0001001 / 23 APR 14

Below 2 500 ft RA, a synthetic voice generates auto callouts:
- RA height callouts
- Retard (airborne).

These announcements come through the cockpit loudspeakers even if the loudspeakers are turned off.
L3 The FWS triggers these announcements.

Ident.: DSC-34-NAV-60-10-10-00015971.0001001 / 23 APR 14

PREDETERMINED HEIGHT CALLOUTS

Pin programming enables the operator to activate the desired callouts.

Ident.: DSC-34-NAV-60-10-10-00015972.0001001 / 23 APR 14

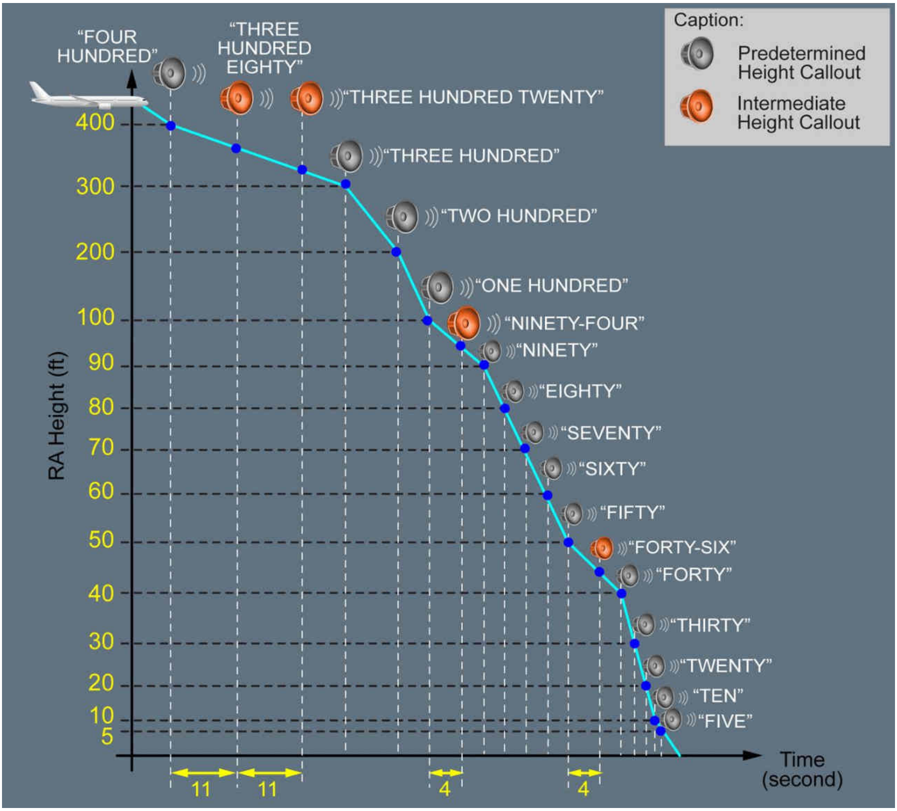
INTERMEDIATE HEIGHT CALLOUTS

Below 400 ft RA, if the time between two consecutive predetermined height callouts exceeds a specific threshold, the current aircraft height is repeated at regular time intervals.
This is referred to as an intermediate RA height callout.
The intermediate RA height callouts are triggered even if the predetermined height callouts are not selected.

L3 Between 400 ft RA and 100 ft RA, the threshold is 11 s.
Below 100 ft RA, the threshold is 4 s.

L2 Between 400 ft RA and 100 ft RA, the height is rounded off to the lower 10 ft (e.g. TWO HUNDRED AND TWENTY).
Between 100 ft RA and 10 ft RA, the height is rounded off to the lower 2 ft.
Below 10 ft RA, the height is rounded off to the lower feet.

Intermediate and Predetermined height Callouts



Ident.: DSC-34-NAV-60-10-10-00015973.0001001 / 23 APR 14

RETARD AUTO CALLOUT

The "RETARD" auto callout is automatically triggered at:
- 10 ft RA, in autoland with the A/THR active
- 20 ft RA, in all the other cases.

L2 For more information about the aural alerts, *Refer to DSC-34-NAV-60-20 Audio Indicators*.

Five (synthetic voice)	The FWS triggers the auto callout when the RA height is 5 ft	Sounds one time
Hundred Above (Synthetic voice) or Plus Hundred (Synthetic voice) See (2)	The FWS triggers the auto callout when the RA height is 100 ft above the DH (or MDA/MDH) (4)	Sounds one time
Minimum (Synthetic voice)	The FWS triggers the auto callout when the RA height is the DH (or MDA/MDH) (4)	Sounds one time

(1) *All audio indicators can be canceled by pressing the EMER CANC pb on the ECP.*

(2) *The operator can select one of the following:*
- *The "Hundred Above" callout*
- *The "Plus Hundred" callout, or*
- *No callout at 100 ft above DH(or MDA/MDH).*

(3) *If the operator selects the smart "FIVE HUNDRED" auto callout.*

(4) *The reference altitude for auto callouts is the RA height for CAT II / CAT III precision approaches (RADIO field in the FMS ACTIVE/PERF page), and the barometric altitude (BARO field in the FMS ACTIVE/PERF page) for non precision approaches.*

RETARD AUTO CALLOUT

Audio Indicator	Condition or Cause	Duration (1)
Retard (Synthetic Voice)	The FWS triggers the auto callout when the RA height is: - 10 ft, in autoland with the A/THR active, or - 20 ft, in all the other cases.	Sounds one time at 20 ft (10 ft in autoland with A/THR ON), then sounds until the flight crew sets the thrust levers to IDLE
or Ten Retard (Synthetic voice) See (2)	The FWS triggers the auto callout when the RA height is 10 ft, in autoland with the A/THR active.	Sounds one time
or Twenty retard (Synthetic voice) See (3)	The FWS triggers the auto callout when the RA height is 20 ft, in manual landing or with the A/THR inactive.	Sounds one time

(1) *All audio indicators can be canceled by pressing the EMER CANC pb on the ECP.*

(2) *If the operator selects the "TEN" auto callout.*

(3) *If the operator selects the "TWENTY" auto callout.*

L2 For more information on the "Retard, Retard" auto callout, *Refer to DSC-70-20 Audio Indicators*.

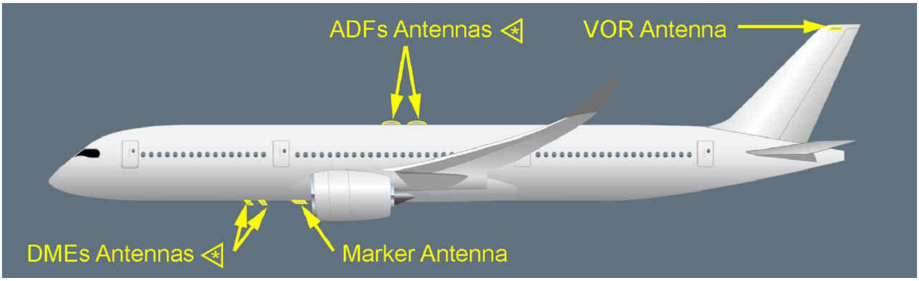
GENERAL

Ident.: DSC-34-NAV-70-10-00012308.0001001 / 09 MAR 16
Applicable to: ALL

The radio navigation system provides the flight crew and the other aircraft systems with navigation information.

The radio navigation system includes the following systems:
- A single VHF Omnidirectional Range (VOR) system, or a dual VOR system ◁
- One Marker Beacon (MKR) system
- A single Distance Measuring Equipment (DME) system, or a dual DME system ◁
- A single Automatic Direction Finder (ADF) system ◁ , or a dual ADF system ◁ .

Antennas



NAVAIDS

Applicable to: ALL

Ident.: DSC-34-NAV-70-10-10-00012309.0001001 / 09 MAR 16

VOR

The VOR system provides:
- The magnetic bearing of the aircraft from the selected ground station
- The selected course
- The aural and digital identification of the selected ground station.

L2 The VOR system has:
- One or two VOR receiver(s)
- One VOR antenna.

L1 The ND displays the VOR data on the CAPT or the F/O side of the cockpit, when the flight crew selects the VOR via the VOR/ADF ◁ pb on the EFIS CP.

L2 For more information about the information that is displayed on the ND, *Refer to DSC-31-CDS-40-40-10 Overview*.
The VOR system operates in a frequency range of 108 MHz to 117.95 MHz.

Ident.: DSC-34-NAV-70-10-10-00012310.0001001 / 20 OCT 14

MKR

The MKR system provides the flight crew with an aural and visual indication when the aircraft is over the marker transmitter. The VOR system includes the MKR system.
L2 The aircraft has a marker antenna that is connected to the VOR system.
L1 Both PFDs display the outer, middle, and inner markers.
L2 For more information about the information that is displayed on the PFD, *Refer to DSC-31-CDS-40-20-110 ILS Marker*.
The MKR system operates in a frequency of 75 MHz.

Ident.: DSC-34-NAV-70-10-10-00012311.0001001 / 03 APR 20

DME

The DME system provides:
- The distance between the aircraft and the selected ground station
- The audio indicator and the digital identification of the selected ground station.

L2 The DME system has:
- One or two DME receiver(s)
- One or two DME antenna(s).

The FMS can tune up to four DME ground stations:
- One for VOR/DME distance display
- Two for DME/DME computation
- One for ILS/DME distance display.

L1 For each side, the DME data is displayed on:
- The ND, when the flight crew selects the VOR via the VOR/ADF ⊲ pb on the EFIS CP
  L2 For more information about the data that is displayed on the ND, *Refer to DSC-31-CDS-40-40-10 Overview*.
- L1 The PFD, when the flight crew presses the LS pb on the EFIS CP.
  L2 For more information about the data that is displayed on the PFD, *Refer to DSC-31-CDS-40-20-10 Overview*.

Ident.: DSC-34-NAV-70-10-10-00012312.0001001 / 09 MAR 16

ADF ◁

The ADF system provides:

- The relative bearing between:
  - The aircraft centerline
  - The direction of the selected ground Non-Directional Beacon (NDB) station
- The aural and digital identification of the selected ground station.

L2 The ADF system has:

- One or two ADF receiver(s)
- One or two ADF active antenna(s).

L1 For each side, the ND displays the ADF data when the flight crew selects the ADF via the VOR/ADF pb on the EFIS CP.

L2 For more information about the information that is displayed on the ND, *Refer to DSC-31-CDS-40-40-10 Overview*.
The ADF system operates in a frequency range from 190 kHz to 1 750 kHz.

NAVAIDS TUNING

Applicable to: ALL

Ident.: DSC-34-NAV-70-10-20-00012313.0001001 / 23 APR 14

NORMAL OPERATION

In normal operation, the FMS automatically tunes the navaids. However, the flight crew can manually tune the navaids, via the FMS POSITION/NAVAIDS page.

L2 For more information about the navaids tuning by the FMS, *Refer to DSC-22-FMS-10-30-20 Description*.

Ident.: DSC-34-NAV-70-10-20-00012314.0001001 / 09 MAR 16

STBY RAD NAV

In the case of dual FMS failure, the flight crew can use RMP 1 or RMP 2 in order to tune the VOR 1, VOR 2 ◁ , DME 1, DME 2 ◁ , ADF 1 ◁ , ADF 2 ◁ and the landing systems. This tuning is the Standby Radio Navigation (STBY RAD NAV) mode.
The flight crew must press the STBY RAD NAV guarded key on RMP 1 or 2 to activate the STBY RAD NAV mode.

L2 The STBY RAD NAV guarded key on RMP 3 is inhibited.
When this mode is activated, the RMP has priority over the FMS in order to manage the navaids.

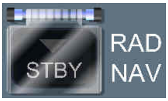
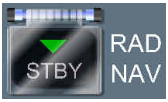
STBY RAD NAV KEY

The STBY RAD NAV key enables the flight crew to change the navaid manual selection from the FMS to the RMP.



The FMS tunes the navaids. The RMP is only used to control the communication.

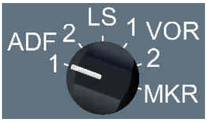


The RMP tunes the navaids. The RMP operates in STBY RAD NAV mode, and still controls the communication.

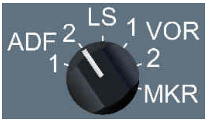
Ident.: DSC-34-NAV-70-20-GRMP-00003348.0001001 / 09 MAR 16

RAD NAV SELECTOR

The flight crew uses the RAD NAV selector to select the navaid that they want to listen to.

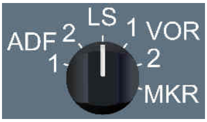


The flight crew can listen to ADF 1 🔊 .



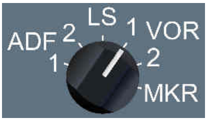
The flight crew can listen to ADF 2 🔊 .

L12



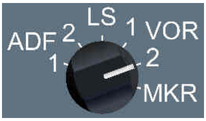
The flight crew can listen to the tuned landing system and to the associated DME.
In order to listen to the DME associated to the tuned landing system, the flight crew shall select the LS pb.

L12

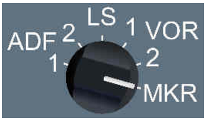


The flight crew can listen to the and VOR 1 and DME 1.
In order to listen to the DME associated to the VOR, the flight crew shall not select the LS pb.

L12



The flight crew can listen to the VOR 2 ◁ and DME 2 ◁ .
In order to listen to the DME associated to the VOR, the flight crew shall not select the LS pb.



The flight crew can listen to the MKR.

L2 In the case of FMS selector on BOTH ON 1 or BOTH ON 2, in order to listen to the DME, the flight crew shall ensure that both LS pb are in the same state.

Ident.: DSC-34-NAV-70-20-GRMP-00003349.0001001 / 23 APR 14

RAD NAV RECEPTION KNOB

The flight crew uses the RAD NAV reception knob to:
- Enable the audio reception of the navaid
- Adjust the volume of the navaid reception.

The associated navaid is not in audio reception mode.

The associated navaid is in audio reception mode.
The flight crew presses the RAD NAV reception knob in order to receive the audio of the navaid.
The flight crew turns the RAD NAV reception knob in order to adjust the volume of the boomsets and the loudspeakers.

Ident.: DSC-34-NAV-70-20-GRMP-00003350.0001001 / 23 APR 14

VOICE KEY

The flight crew uses the VOICE key to remove the audio identification signal from the navaid audio signals.

The reception of the navaid voice signal and the reception of the audio identification signal are active.
When pressed, inhibits the reception of the audio identification signal.

The reception of the navaid voice signal is active. The reception of the audio identification signal is inhibited.
When pressed, enables the reception of the audio identification signal.

GENERAL

Ident.: DSC-34-NAV-80-10-00003353.0001001 / 05 JUL 16
Applicable to: ALL

GENERAL

The Airport Navigation Function (ANF) helps the flight crew to navigate on airports, and provides better flight crew awareness on the airport.
On each Navigation Display (ND), the ANF provides the following functions:

NAVIGATION

- Display the aircraft position on the current airport moving map, and find any location on the airport
- Display any airport moving map from the ANF database
- Add marks on an airport moving map

ROW/ROP AND BTV

- Set the parameters for the Brake to Vacate (BTV) function, the Runway Overrun Warning (ROW), and the Runway Overrun Protection (ROP)
- Provide situation awareness during the landing roll

L2 For more information about the ROW/ROP and the BTV, *Refer to DSC-34-32-10 General*.

L1 AIRPORT NAVIGATION SURVEILLANCE

- Compute and display the runway approaching advisory alerts
- Provide airport information to the FMS for the computation of the takeoff surveillance function.

L2 For more information about the takeoff surveillance function, *Refer to DSC-22-FMS-10-70-20 Takeoff Surveillance Function*.

ARCHITECTURE

Applicable to: ALL

Ident.: DSC-34-NAV-80-10-GARCH-00003354.0001001 / 28 APR 14

The aircraft has two independent ANFs, one for the CAPT side, one for the F/O side.
Each ND displays the airport moving map, when the range selector of the EFIS CP is set to the ZOOM position. The flight crew uses the KCCU to activate the interactive functions of the ND.

L2 In normal operation:

- The ANF on the CAPT side uses data from:
  - ADIRU 1
  - FMS 1
- The ANF on the F/O side uses data from:
  - ADIRU 2
  - FMS 2.

AIRPORT NAVIGATION FUNCTION

The CAPT(F/O) outer display unit computes the ANF that appears on the CAPT(F/O) ND.
L3 The CAPT(F/O) outer display unit cannot display the ANF.

L2 ANF DATABASE

The aircraft has two ANF databases.
An ANF database is loaded in both CAPT and F/O outer display units.
Each ANF database provides information to the onside airport moving map.
The ANF database has two database cycles with a validity period for each cycle.
L3 The validity period and the part number of each ANF database are displayed on the STATUS panel of the ANF, on the ND. For more information about the STATUS panel, *Refer to DSC-34-NAV-80-20 Purpose of STATUS*.

The ANF checks the validity of the database:
- If the date of the aircraft time reference is out of the validity period of the active database cycle, the STATUS panel of the ANF displays the DATABASE CYCLE NOT VALID message.
- If each ANF database has a different part number, the STATUS panel of the ANF displays the CHECK ONSIDE ARPT DATABASE P/N message.

L2 The flight crew can change from one database cycle to the other, via the STATUS panel of the ANF display.

Ident.: DSC-34-NAV-80-10-GARCH-00012573.0001001 / 28 APR 14

L2 ADIRS

Each ANF uses the onside ADIRU data in order to display the aircraft position on the ANF airport moving map.

Ident.: DSC-34-NAV-80-10-GARCH-00003359.0001001 / 28 APR 14

L2 FMS

Each FMS provides the onside ANF with the flight plan data:
- The origin, alternate, and destination airports
- The runway thresholds.

L3 If FMS 1 or FMS 2 is lost, the ANFs receive the FMS data in accordance with the position of the FMS selector.

Ident.: DSC-34-NAV-80-10-GARCH-00019611.0001001 / 28 APR 14

L2 BTV

The ANF provides the BTV with the airport database. The ANF is the interface between the flight crew and the BTV.

AIRPORT MOVING MAP

Ident.: DSC-34-NAV-80-10-00019904.0002001 / 27 FEB 17
Applicable to: ALL

AIRPORT MOVING MAP

The airport moving map is available when the flight crew sets the ND range selector to the ZOOM position, in one of the following ND modes:
- PLAN
- ARC
- ROSE-NAV.

The flight crew can select 5 ND ranges for the ANF display:
- 5 NM
- 2 NM
- 1 NM
- 0.5 NM
- 0.2 NM.

At landing, regardless of the position of the ND mode selector and the ND range selector, the airport moving map appears in ARC mode with a 1 NM or 2 NM range in order to entirely display the runway that is ahead of the aircraft.

L3 In the case of an EFIS CP failure when the range is ZOOM, there is an automatic reconfiguration of the associated ND in ROSE-NAV mode, with 5 NM range.

AIRPORT NAVIGATION SURVEILLANCE

Ident.: DSC-34-NAV-80-10-00019905.0001001 / 05 JUL 16
Applicable to: ALL

The ANF provides the flight crew with several advisories and information.

RUNWAY APPROACHING ADVISORY

During taxi, the runway approaching advisory warns the flight crew that the aircraft is near:
- A runway, or
- A runway intersection.

L2 The ANF triggers the runway approaching advisory at least 7 s before the aircraft enters the runway area.

L3 The runway approaching advisory computes a protection volume in front of the aircraft, and a runway area volume with:

- The aircraft position
- The ground speed
- The runway data of the airport moving map.
  The runway area includes the stopways and the runway displaced areas.

L2 The runway approaching advisory is only active on ground, when the ground speed is below 40 kt, for more than 10 s.

The ANF no longer displays the runway approaching advisory, when:

- The aircraft stops, or
- The aircraft is in the runway area for more than 2 s, or
- The advisory is triggered for more than 30 s, or
- The advisory no longer expects that the aircraft will enter the runway area within the next 7 s.

L1 The ANF displays the indications of the runway approaching advisory on:

- The ND
- The PFD

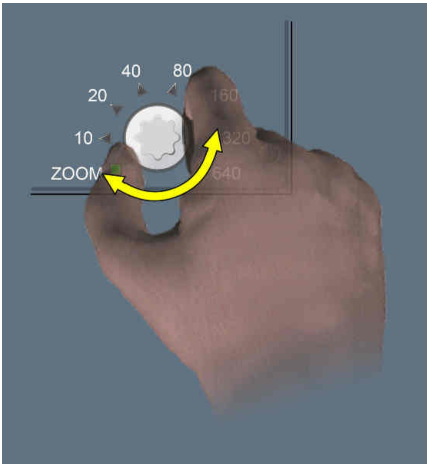
In the ZOOM position, the airport moving map is displayed on the ND with a 5 NM range, or below.



When in ZOOM position, the flight crew turns the selector to change the range:

- Counterclockwise to decrease the range, or
- Clockwise to increase the range.

The range of the ZOOM changes with the following sequence:

- 5 NM
- 2 NM
- 1 NM
- 0.5 NM
- 0.2 NM.

If the flight crew sets the ND Range selector to a range other than ZOOM, the moving airport map is no longer displayed on the ND.

AIRPORT INFORMATION

 TOULOUSE-BLAGNAC LFBO TLS	The airport is part of the flight plan. The airport IATA and ICAO codes, and the airport name are displayed.
 ARPT NOT IN ACTIVE F-PLN	The airport is not part of the flight plan. This message appears in PLAN mode only, if the flight crew selects an airport that is not part of the flight plan.
 ICAO NOT IN DATABASE	airport to be displayed is not in the ANF database.
 NO FMS DEST ARPT	The airport code to be displayed is not in the FMS database.

Ident.: DSC-34-NAV-80-20-20-00003367.0001001 / 31 JUL 18

AIRPORT MOVING MAP

In normal operation, the ANF displays a default airport, based on the current aircraft position and on the FMS flight plan.
The default airport can be either the departure, destination, or alternate airport of the FMS flight plan, depending on the current aircraft position.
Nevertheless, the flight crew can display any airport of the ANF database in PLAN mode, via the ARPT SEL panel of the ANF.

ARC OR ROSE-NAV MODE

In ARC or ROSE-NAV mode, when the range selector is in the ZOOM position, the ANF displays:
- On ground: the current airport moving map
- In flight:
  - The airport moving map of the departure or the destination airport, or
  - The direction of the destination airport.

Airport Moving Map

The ANF displays the departure or the destination airport moving map if:
- The airport is in the ND range
- The altitude of the aircraft is less than 5 000 ft above the airport.

The airport moving map is displayed in accordance with the aircraft position. The orientation of the default airport is the magnetic or true heading, in accordance with the position of the TRUE/MAG pb on the AFS CP.

Airport Direction

When the airport moving map of the departure or the destination airport is not displayed, the ANF displays:
- A destination arrow that points to the destination airport
- The ICAO code of the destination airport
  If a runway is selected in the FMS, the runway code is also displayed.
- The distance from current aircraft position to the destination airport.

Information

L2 The airport information, the distance and the direction are based on the threshold of the destination runway from the FMS.

L1 PLAN MODE

In PLAN mode, the following airport is displayed:
- The default airport, or
- Any airport of the database that the flight crew manually selects for display.

L2 The default airport is the destination airport, when:
- The last consulted airport is the destination airport, or
- In cruise or descent, the distance between the departure and destination airports is less than 300 NM, or
- The distance between the departure and the destination airports is more than 350 NM, and the distance between the aircraft position and the departure airport is more than 50 NM.

Otherwise, the default airport is the departure airport.

L1 When the flight crew selects a departure or a destination runway in the ACTIVE FMS flight plan:
- A green triangle indicates the selected runway

  L2 When both departure and landing runways are on the same airport, two FMS green triangles are displayed on the same airport moving map.
- L1 The runway ident of the selected runway is displayed in green.

The orientation of the airport moving map is the TRUE north, and the map is centered on:
- The aircraft, when the aircraft is on ground
- The Airport Reference Point (ARP), when the aircraft is in flight.

PURPOSE OF INTERACTIVE FUNCTIONS

MOVE FUNCTION

The flight crew can move the airport moving map via the KCCU. The flight crew presses the validation pb and simultaneously moves the cursor with the trackball.

As soon as the validation pb is released:
- In PLAN mode: The airport moving map remains at the new position
- In ARC or ROSE–NAV mode: The airport moving map is progressively centered on the aircraft symbol.

INTERACTIVE MENU

When the flight crew clicks anywhere on the airport moving map, the interactive menu with the airport navigation functions is displayed.

L2 The interactive menu automatically disappears when the flight crew:
- Clicks out of the interactive menu, or
- Selects one of the functions, or
- Changes the ND range or mode.

Ident.: DSC-34-NAV-80-20-20-00019198.0001001 / 28 APR 14

DECLUTTER RWY ITEM

In order to help the flight crew to select an exit for BTV, and to read the map, some symbols that are not related to the selected runway are displayed in grey and become not interactive.
When the DECLUTTER RWY is active, the DISPLAY ALL function is available in the interactive menu. When clicked, all the hidden symbols appear on the map.

Ident.: DSC-34-NAV-80-20-20-00019067.0001001 / 28 APR 14

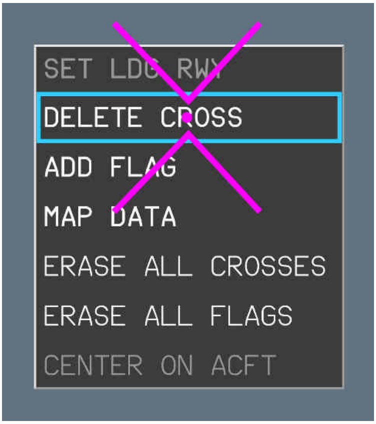
MARK ITEMS

These items enable the flight crew to add or remove marks on the airport moving map.

L12	⚑	Green flags To locate or mark a given point on the airport.
L12	✖	White crosses To indicate a problem, such as a closed taxiway.

When the flight crew clicks on the airport moving map, the symbol appears at the cursor position.
The CAPT and the F/O sides share the marks.
When the flight crew clicks on a mark of the airport moving map, the interactive menu of the ND displays the DELETE function instead of the ADD function.

DELETE Function



SET LDG RWY
DELETE CROSS
ADD FLAG
MAP DATA
ERASE ALL CROSSES
ERASE ALL FLAGS
CENTER ON ACFT

The ANF removes the marks on the airport moving map after engine shutdown.

L3 All flag and cross marks are deleted from database:
- At the start of each flight, when the flight phase of the FWS change to flight phase 1, or
- If the flight crew changes the ANF database cycle.

Ident.: DSC-34-NAV-80-20-20-00019069.0001001 / 28 APR 14

MAP DATA ITEM

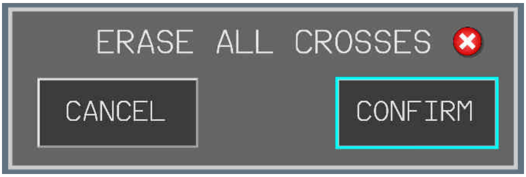
This item enables the flight crew to directly access the MAP DATA panel. For more information about the MAP DATA panel, *Refer to DSC-34-NAV-80-20 Purpose of MAP DATA*.

Ident.: DSC-34-NAV-80-20-20-00019070.0001001 / 28 APR 14

ERASE MARK ITEMS

These items enable the flight crew to delete all marks that appear on the airport moving map. A confirmation box is displayed, when the flight crew selects the ERASE ALL CROSSES or ERASE ALL FLAGS item.

ERASE ALL CROSSES



ERASE ALL CROSSES
CANCEL
CONFIRM

Ident.: DSC-34-NAV-80-20-20-00019071.0001001 / 28 APR 14

CENTER ON ACFT ITEM

This item is only available in PLAN mode. This item enables the flight crew to center the airport moving map on the aircraft position.

Ident.: DSC-34-NAV-80-20-20-00019049.0001001 / 28 APR 14

PURPOSE OF MAP DATA

The MAP DATA panel enables the flight crew:
- To display information of an interactive item of the airport moving map
- To center the display of the airport moving map on an interactive item
- To add or remove marks on an interactive item.

Ident.: DSC-34-NAV-80-20-20-00018998.0001001 / 28 APR 14

MAP ITEM LIST

The flight crew can:
- Select one map item in the list in accordance with the search filter, or
- Use the KCCU to enter the item IDENT.

Ident.: DSC-34-NAV-80-20-20-00019022.0001001 / 28 APR 14

MAP ITEM SEARCH FILTER

The map item search filter enables the flight crew to access the list of one type of the following items:
- The runway
- The taxiway
- The stand
- Other.

Ident.: DSC-34-NAV-80-20-20-00019023.0001001 / 28 APR 14

ADD/REMOVE SYMBOLS BUTTONS

The Add/Remove Symbols buttons enables the flight crew to add or remove crosses and flags on the selected map item.

When the flight crew selects a map item with an existing symbol, the flight crew can, :
- Delete the existing symbol

  Note: *The ADD button changes to a DELETE button.*

- Add a flag instead of a cross (or add a cross instead of a flag).

Ident.: DSC-34-NAV-80-20-20-00019024.0001001 / 28 APR 14

CENTER MAP BUTTON

The CENTER MAP button enables the flight crew to center the airport moving map on the selected item, when in PLAN mode.

Ident.: DSC-34-NAV-80-20-20-00019025.0001001 / 09 MAR 16

MESSAGE/ITEM INFORMATION

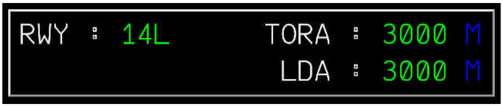
MESSAGE

When the flight crew enters a map item that is not in the search filter, one of the following message appears, instead of the MAP DATA information:
- NOT IN RWY DATABASE
- NOT IN TWY DATABASE
- NOT IN STAND DATABASE
- NOT IN DATABASE.

ITEM INFORMATION

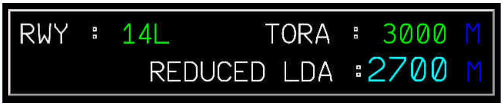
When the flight crew selects a map item, the item information appears in accordance with the selected map item.

L12



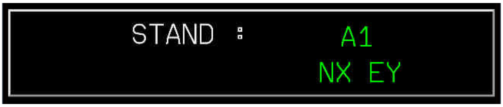
```
RWY : 14L         TORA : 3000 M
                   LDA : 3000 M
```

Information for the runways.
TORA and LDA appears in feet (ft) with the US unit of length option.



```
RWY : 14L         TORA : 3000 M
           REDUCED LDA :2700 M
```

Information for the runways with a shift.



```
        STAND :        A1
                     NX EY
```

Information for the aircraft stand.

Ident.: DSC-34-NAV-80-20-20-00019050.0001001 / 28 APR 14

PURPOSE OF LANDING

The LANDING panel enables the flight crew to display landing information that are mainly used for BTV and ROW/ROP configuration.

L2 For more information about the landing panel for BTV, *Refer to DSC-34-32-30-20-60 ND*.
For more information about the landing panel for ROW/ROP, *Refer to DSC-34-32-20-20-50 ND*.

Ident.: DSC-34-NAV-80-20-20-00019006.0001001 / 07 NOV 16

PURPOSE OF MODIFY RWY

The flight crew can shift the runway threshold or the runway end.

L2 The flight crew can modify only one runway. If another runway is modified, the modification of the previous runway is cleared.
When BTV is armed, the THRESHOLD SHIFT entry field, and the END SHIFT entry field are disabled.

L1 *Note:* *If BTV is armed on a shifted runway, the flight crew may clear this shift if they try to enter a shift on another runway. In this case, BTV remains armed and will revert to BRK MED when the aircraft will be below 300 ft.*

L3 The shifted landing distance is removed:
- 5 min after the last engine shutdown, or
- When the flight crew changes the ANF database cycle.

L1 When the flight crew validates the runway shift with the return button, the runway shift is displayed on the MAP DATA panel.

Ident.: DSC-34-NAV-80-20-20-00019051.0001001 / 28 APR 14

PURPOSE OF ARPT SEL

The ARPT SEL panel enables the flight crew to display the information about the airports of the database.
In PLAN mode, the flight crew can select and display airports different from origin, alternate, and destination airports.

Ident.: DSC-34-NAV-80-20-20-00019030.0001001 / 28 APR 14

LIST OF AIRPORTS

The flight crew can:
- Select one airport in the list in accordance with the item search filter, or
- Use the KCCU to enter the airport ICAO or IATA code.

The ICAO code, IATA code, and city name of the airport are displayed in:
- Yellow, when the selected airport is not the airport displayed on the ND, or
- Green, when the selected airport is displayed on the ND.

Ident.: DSC-34-NAV-80-20-20-00019031.0001001 / 28 APR 14

AIRPORT ITEM SEARCH FILTER

The airport search filter enables the flight crew to access the list of airports via one of the following items:
- The ICAO code
- The IATA code
- The city name.

Ident.: DSC-34-NAV-80-20-20-00019032.0001001 / 28 APR 14

SELECTED AIRPORT INFORMATION

When the flight crew selects an airport, the airport information is displayed in:
- Yellow, when the selected airport is not the airport displayed on the ND, or
- Green, when the selected airport is displayed on the ND.

When an airport is not in the ANF database or the entry is not correct, one of the following message is displayed, instead of the airport information:
- NOT IN ICAO DATABASE
- NOT IN IATA DATABASE
- NOT IN CITY NAME DATABASE.

Ident.: DSC-34-NAV-80-20-20-00019033.0001001 / 28 APR 14

DISPLAY AIRPORT BUTTON

When the flight crew clicks on the DISPLAY AIRPORT button, the ANF displays the associated airport moving map on the ND.
In ARC or ROSE-NAV mode, the SET PLAN MODE message appears if the flight crew selects an airport different from the current airport displayed on the ND, and clicks on the DISPLAY AIRPORT button.

Ident.: DSC-34-NAV-80-20-20-00019034.0001001 / 28 APR 14

FMS AIRPORTS

The flight crew can display the origin, destination, or alternate airport of the FMS flight plan via the corresponding shortcut button.

Ident.: DSC-34-NAV-80-20-20-00019052.0001001 / 28 APR 14

PURPOSE OF STATUS

The STATUS panel enables the flight crew to:
- Check the status of the airport database
- Change the database cycle.

Ident.: DSC-34-NAV-80-20-20-00019035.0001001 / 28 APR 14

VALIDITY PERIOD

The validity period of both database cycles is displayed.

Ident.: DSC-34-NAV-80-20-20-00019036.0001001 / 28 APR 14

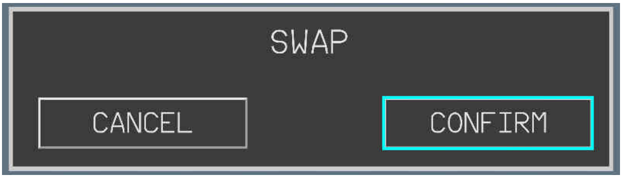
SWAP BUTTON

The SWAP button enables the flight crew to change the database cycle. A confirmation action is required.

L3 When a flight crew changes the database cycle, the databases on both side (CAPT, F/O) switch to the new cycle.

L2 If a database cycle is changed, all symbols of the airport moving map are deleted.

SWAP Confirmation



Ident.: DSC-34-NAV-80-20-20-00019037.0001001 / 28 APR 14

DATABASE PART NUMBER

The AIRPORT DATABASE field displays the part number of the database.

L2 If the ANF database is missing or not correctly loaded, the AIRPORT DATABASE field displays dashes.

Ident.: DSC-34-NAV-80-20-20-00019038.0001001 / 28 APR 14

MESSAGE

When the active database is out of date, the DATABASE CYCLE NOT VALID message appears.
If the database part number on CAPT side is different from the database part number on F/O side, the CHECK ONSIDE ARPT DATABASE P/N message appears.

Ident.: DSC-34-NAV-80-20-20-00003373.0001001 / 28 APR 14

RUNWAY APPROACHING ADVISORY

ARC AND ROSE-NAV MODES

In ARC and ROSE-NAV modes, when the aircraft approaches one or two runways, the ANF displays on the airport moving map:

- The runway that the aircraft approaches in yellow
  L2 The runway pulses.
- L1 A runway ident box that indicates the runway(s) the aircraft approaches.

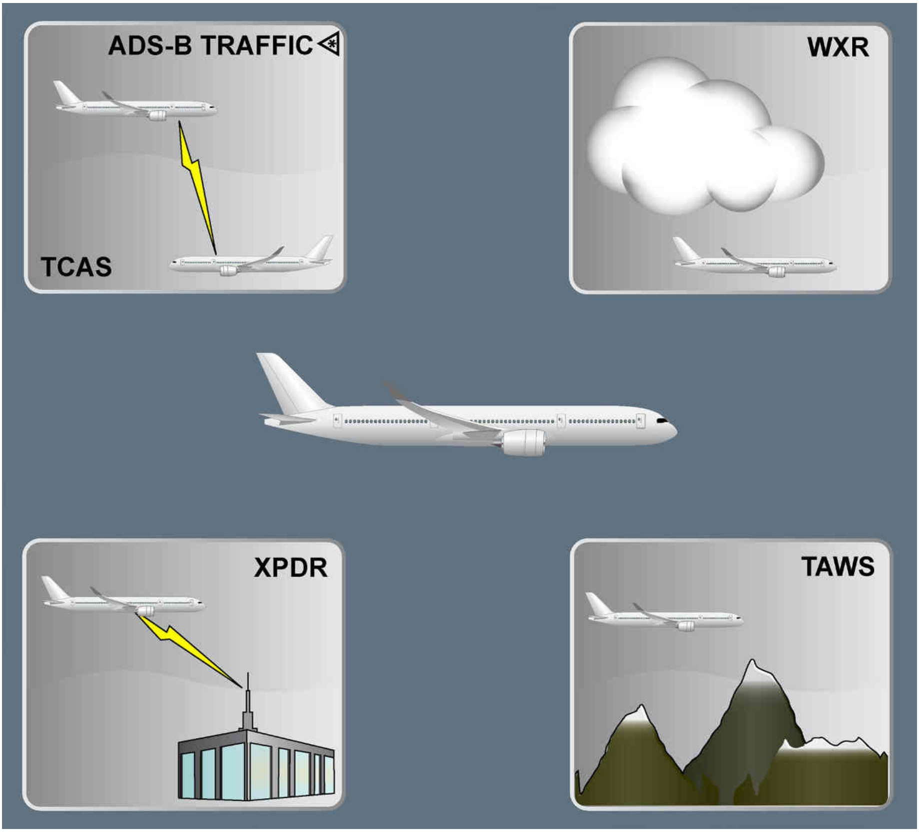
OVERVIEW

Ident.: DSC-34-SURV-10-00003178.0001001 / 14 JUN 16
Applicable to: ALL

The Surveillance (SURV) system includes the following systems that perform aircraft surveillance functions:
- Terrain Awareness and Warning System (TAWS)
- Weather Radar (WXR) system, including the predictive windshear detection
- Traffic Collision Avoidance System (TCAS)
- Automatic Dependent Surveillance - Broadcast -Traffic (ADS-B Traffic ◁)
- Transponder (XPDR).



ARCHITECTURE

Applicable to: ALL

Ident.: DSC-34-SURV-10-10-00003179.0001001 / 05 MAY 14

The SURV system has:
- Two identical surveillance systems (SYS 1 and SYS 2)
- A Weather Radar (WXR) antenna
- Four identical antennas with TCAS/Mode S combination
- A SURV panel
- A dedicated MFD pages.

SURV SYS

The SURV includes two identical surveillance systems, referred to as SYS 1 and SYS 2.

SYS 1 and SYS 2 can both perform all of the environmental surveillance functions that are grouped together as follows:
- The WXR with the TAWS
- The TCAS with the XPDR.

L3 The Aircraft Environment Surveillance Unit (AESU) 1(2) provides the SURV SYS 1(2) function.
In normal operation, the AESU that has the WXR/TAWS selected is the master AESU. It manages the alerts and displays for all of the surveillance functions.

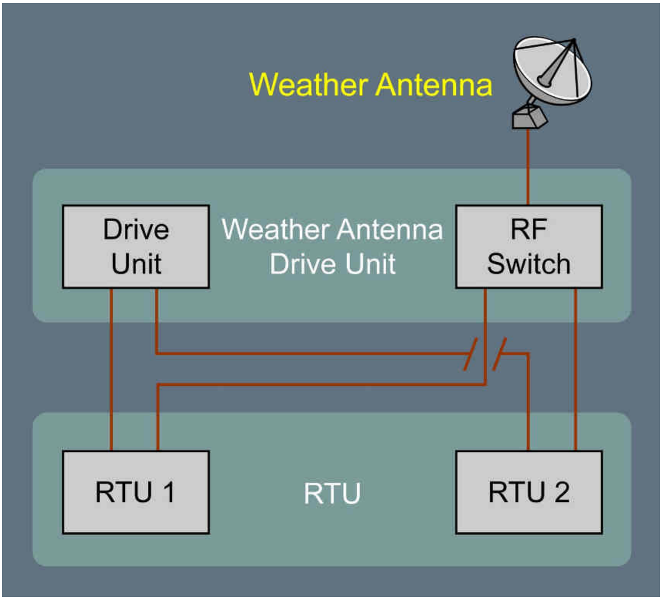
L2 When the aircraft is on ground, SYS 1(2) is automatically selected as the master AESU if the flight number in the FMS is an odd (even) number. It enables the detection of hidden failures.
In the case of an electrical emergency configuration, the flight crew must switch on SYS 2.

Ident.: DSC-34-SURV-10-10-00003181.0001001 / 30 APR 14

WEATHER RADAR (WXR) ANTENNA

The WXR antenna is in the radome.
It receives and transmits signals to the surveillance systems, in order to perform WXR functions.

WXR Antenna Architecture



L3

WEATHER ANTENNA DRIVE UNIT (WADU)

The WADU is next to the antenna in the radome. It supports and controls the antenna in order to perform the WXR functions.

The WADU has:
- A radio frequency switch, to select the SYS that performs the WXR function
- A drive unit that controls the position of the antenna (tilt and azimuth angles).

RADAR TRANSCEIVER UNITS (RTU)

Two RTUs are connected to the WADU in the radome, and each RTU interfaces with an AESU.

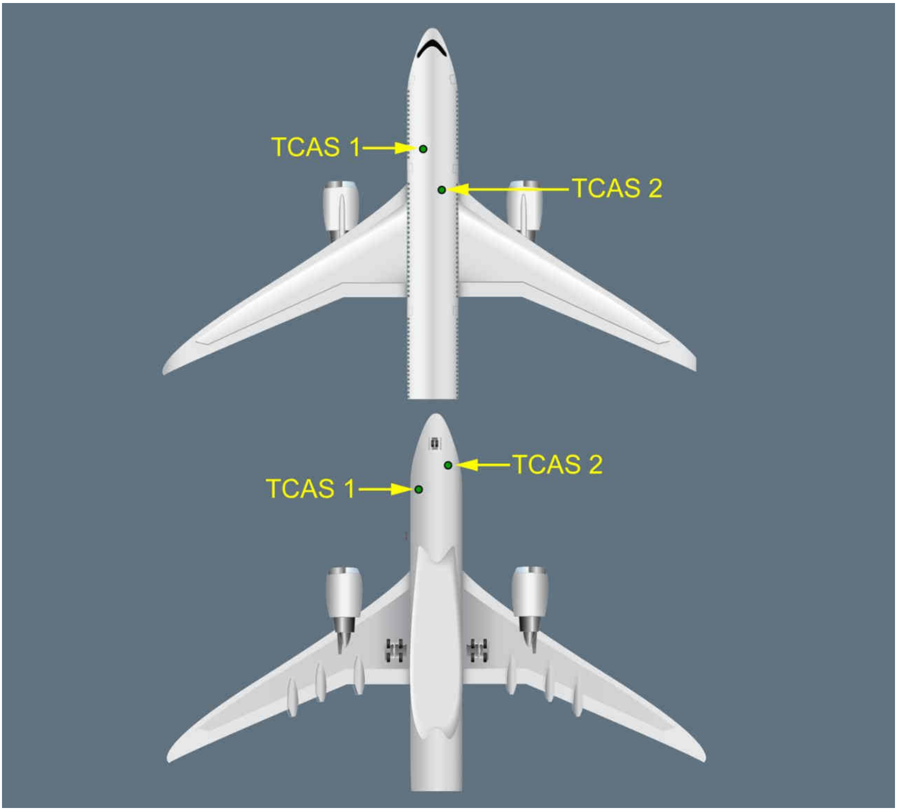
The RTUs:
- Transmit radar pulses
- Receives the return signals from the weather phenomena, and send them to the associated AESU.

Ident.: DSC-34-SURV-10-10-00003182.0001001 / 30 APR 14

TCAS/MODE S ANTENNAS

The aircraft has four combined TCAS/Mode S antennas that transmit and receive data to and from the TCAS and Air Traffic Control (ATC).

Location of TCAS Antennas



Ident.: DSC-34-SURV-10-10-00003183.0001001 / 30 APR 14

SURV PANEL

The flight crew can access the main SURV controls, from the SURV panel.

Note: *The main SURV controls of the SURV panel are also available on the SURV pages of the MFD.*

L2 For more information on the SURV panel *Refer to DSC-34-SURV-70-20 SURV Panel*.

Ident.: DSC-34-SURV-10-10-00003184.0001001 / 30 APR 14

KEYBOARD AND CURSOR CONTROL UNIT (KCCU)

The flight crew uses the KCCU to:
- Access and navigate through the SURV pages on the MFD
- Enter and modify SURV data on the MFD.

Ident.: DSC-34-SURV-10-10-00003185.0001001 / 30 APR 14

MULTIFUNCTION DISPLAY (MFD)

The MFD displays text data provided by the SURV.
The MFD is interactive. Therefore, the flight crew can navigate through the SURV pages, and can consult, enter, or modify data using the Keyboard and Cursor Control Unit (KCCU).

The MFD can display two SURV pages:

- The CONTROLS page, that monitors all surveillance functions

NAVIGATION DISPLAY (ND), VERTICAL DISPLAY (VD) AND PRIMARY FLIGHT DISPLAY (PFD)

The ND, the VD, and the PFD provide situational awareness information, related to the TAWS, WXR, and TCAS surveillance functions.

L2 For more information on the applicable sections of the ND:
- For the TAWS *Refer to DSC-34-SURV-20-20 ND*
- For the WXR *Refer to DSC-34-SURV-30-20 ND*
- For the TCAS *Refer to DSC-34-SURV-40-20 ND*.

For more information on the applicable sections of the VD:
- For the TAWS *Refer to DSC-34-SURV-20-20 VD*
- Fo the WXR *Refer to DSC-34-SURV-30-20 VD*.

For more information on the applicable sections of the PFD:
- For the TAWS *Refer to DSC-34-SURV-20-20 PFD*
- For the WXR *Refer to DSC-34-SURV-30-20 PFD*
- For the TCAS *Refer to DSC-34-SURV-40-20 PFD*.

Ident.: DSC-34-SURV-10-10-00003187.0001001 / 30 APR 14

EFIS CONTROL PANEL (CP)

The flight crew uses the EFIS CP to display weather, terrain, and traffic information on the ND.

L2 For more information on the EFIS CP, *Refer to DSC-34-SURV-70-30 EFIS Control Panel*.

Ident.: DSC-34-SURV-10-10-00003188.0001001 / 30 APR 14

RADIO MANAGEMENT PANEL (RMP)

RMP 1 and RMP 2 are both connected to SYS 1 and SYS 2 of the SURV.

In addition to radio management functions, the RMPs enable the flight crew to control part of the transponder (XPDR). The flight crew can use the RMPs to:
- Change the transponder code (SQWK)
- Perform an IDENT.

L2 RMP 3 is not directly connected to the SURV. However, if the XPDR code is set from RMP 3, the RMP synchronization function enables RMP 1 or RMP 2 to transmit the code to the SURV.

L1 If both RMP 1 and RMP 2 fail, the XPDR control remains available via the SURV/CONTROLS page of the MFD.

Ident.: DSC-34-SURV-10-10-00003189.0001001 / 09 MAR 16

L2 PERIPHERAL SYSTEMS

The SURV interfaces with other peripheral systems:
- Mainly via the avionics network
- Also via other classic connections.

FLIGHT MANAGEMENT SYSTEM (FMS)

The FMS provides navigation and flight plan data.

AIR DATA AND INERTIAL REFERENTIAL UNIT (ADIRU)

The ADIRUs provide ADR, IR, GPS and GPIRS data.

PRIMARY FLIGHT CONTROL COMPUTER (PRIM)

The PRIM provides AFS engagement information.

FLIGHT CONTROL UNIT (FCU)

Both EFIS CPs provides ND settings and the selected altitude.
In the case of an EFIS CP failure, FCU backup provides data to the SURV SYS.

LANDING GEAR EXTRACTION RETRACTION SYSTEM (LGERS)

LGERS provides flight/ground information, and the landing gear position.

FULL AUTHORITY DIGITAL ENGINE CONTROL (FADEC)

The FADEC indicates:
- The running engines
- The takeoff mode selection.

FLIGHT WARNING SYSTEM (FWS)

The SURV interfaces with the FWS for:
- Alert priority management
- Failure display and annunciation.

AIR TRAFFIC COMMUNICATION (ATC COM)

The SURV provides the ATC with:
- The TCAS system status
- The ADS-B Traffic ◁ computation
- The XPDR system status
- The XPDR altitude reporting.

DIGITAL FLIGHT DATA RECORDER (DFDR)

The SURV provides data required for trouble shooting and accident/incident recording, such as:
- Alerts
- System status.

SLAT FLAP CONTROL COMPUTER (SFCC)

The SFCC provides the flaps position.

RADIO ALTIMETERS

The radio altimeters provide the radio altitudes.

MULTI MODE RECEIVER (MMR)

The MMR provides the information that the aircraft is below the glide slope.

L3

ONBOARD MAINTENANCE SYSTEM (OMS)

The SURV and the OMS share data for maintenance purposes.

Intentionally left blank

OVERVIEW

Ident.: DSC-34-SURV-20-10-00003379.0001001 / 30 APR 14
Applicable to: ALL

The Terrain Awareness and Warning System (TAWS):
- Detects terrain collision threats
- Displays terrain information
- Triggers applicable aural and visual indicators.

The TAWS has:
- A Ground Proximity Warning System (GPWS) function with five basic modes (*Refer to DSC-34-SURV-20-10 GPWS*)
- A Terrain (TERR) and obstacle function with two modes, including the peaks function (*Refer to DSC-34-SURV-20-10 Terrain Function*)
- A TAWS database (*Refer to DSC-34-SURV-20-10 TAWS Database*).

GPWS

Applicable to: ALL

Ident.: DSC-34-SURV-20-10-10-00003380.0001001 / 30 APR 14

The purpose of the GPWS function is to warn the flight crew of potentially hazardous situations, such as a collision with terrain.

The GPWS function monitors the flight path of the aircraft and triggers visual and audio indicators, when the aircraft is in one of the following situations:
- Excessive rate of descent (Mode 1)
- Excessive terrain closure rate (Mode 2)
- Altitude loss after takeoff or go-around (Mode 3)
- Terrain clearance not sufficient, if not in landing configuration (Mode 4)
- Excessive descent below the glide slope (Mode 5).

Note: *Stall or windshear alerts override GPWS visual and audio indicators.*

Ident.: DSC-34-SURV-20-10-10-00003382.0001001 / 30 APR 14

PRINCIPLE

The GPWS function detects terrain collision threats by comparing the geometric altitude of the aircraft and its trajectory with the information provided by the Radio Altimeters (RA).

L3 The TAWS computes the geometric altitude of the aircraft, by using:
- Pressure altitude
- GPS altitude
- Radio-altitude

- Temperature
- Barometric references
- Data from the TAWS database.

L2 The GPWS envelopes can be slightly modified for some airports, in order to minimize unexpected alerts.

Ident.: DSC-34-SURV-20-10-10-00003383.0001001 / 30 APR 14

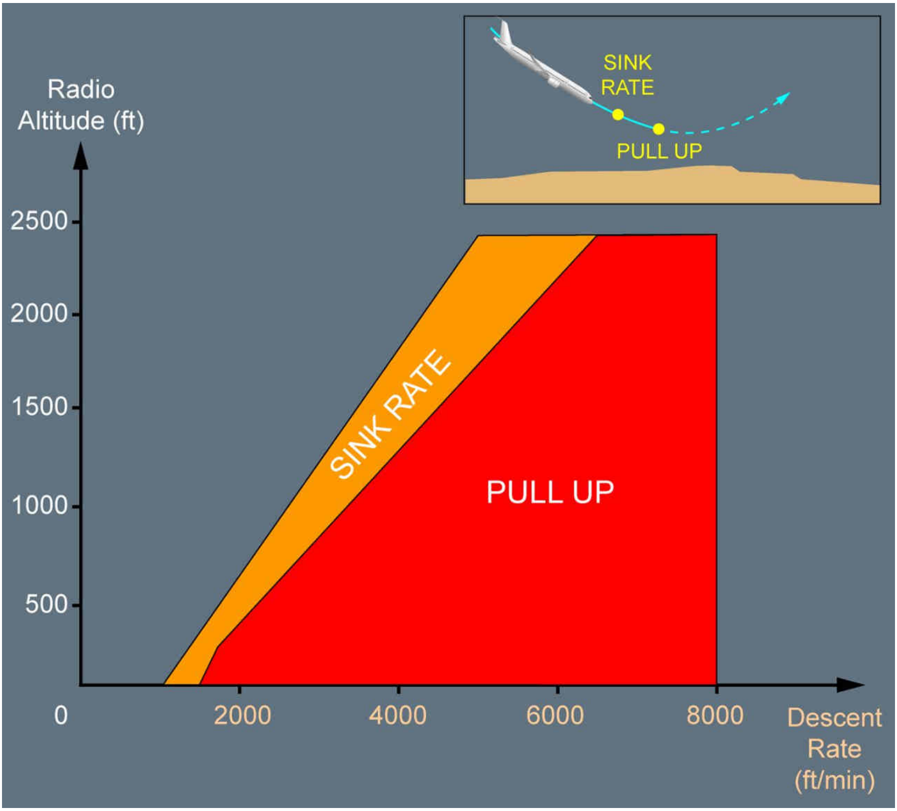
EXCESSIVE RATE OF DESCENT (MODE 1)

If a high rate of descent is detected at low altitude, the following alerts are triggered:
- The “SINK RATE, SINK RATE” audio indicator
- The SINK RATE visual indicator on the PFD.

If this rate is, or becomes excessive, the alert will change to:
- The “PULL UP” audio indicator that repeats as long as the aircraft descends at an excessive rate
- The PULL UP visual indicator on the PFD.

L2 Mode 1 is inhibited when the aircraft is close to the ground.

Excessive Rate of Descent



The "SINK RATE" envelope moves to the right, when the aircraft is above the glide slope beam, in order to avoid any undue alert during a glide slope capture.

L3 The descent rate data is the barometric vertical speed, or the inertial vertical speed, if the barometric vertical speed is not available.

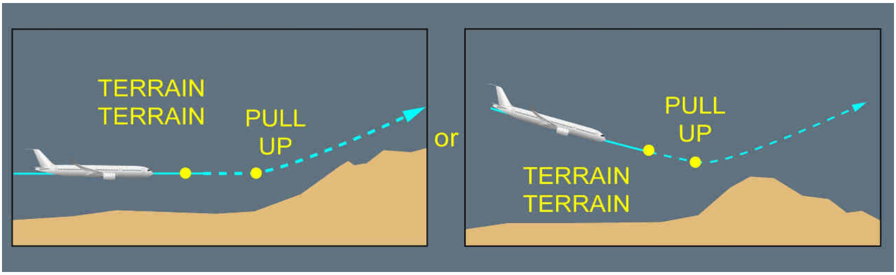
Ident.: DSC-34-SURV-20-10-10-00003384.0001001 / 08 JUL 19

EXCESSIVE TERRAIN CLOSURE RATE (MODE 2)

If the aircraft approaches the terrain with an excessive rate, the following alerts are triggered, even if the aircraft is not descending:
- The “TERRAIN, TERRAIN” audio indicator
- The PULL UP visual indicator on the PFD.

If the closure rate is not reduced, the “PULL UP” audio indicator replaces the “TERRAIN, TERRAIN” audio indicator and repeats as long as the aircraft has an excessive terrain closure rate.

Excessive Terrain Closure Rate



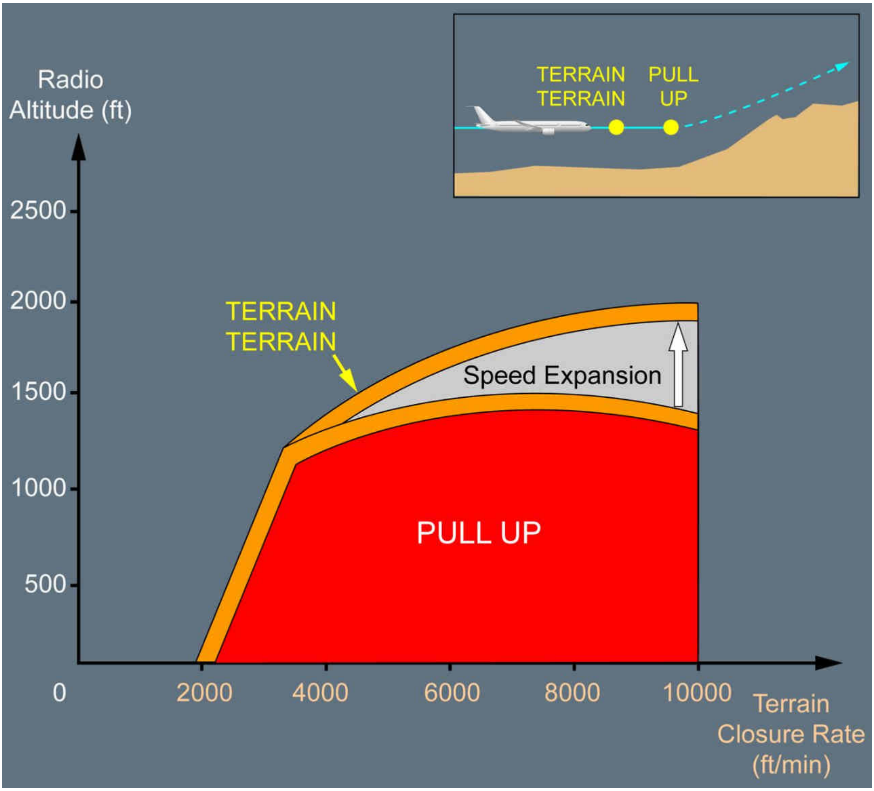
L2

AIRCRAFT NOT IN LANDING CONFIGURATION (MODE 2A)

Mode 2A applies, if the aircraft is at low altitude, and:
- The flaps are not extended for landing, or
- The landing gear is not extended, or
- The aircraft is not flying an XLS approach.

The upper cutoff limit of the envelope will increase, as applicable, depending on the airspeed.

Excessive Terrain Closure Rate While Aircraft Not in Landing Configuration



The alerts stop if:

- The aircraft is no longer in the protection envelope for a minimum of 45 s
- The aircraft increases the altitude at which it exited the protection envelope by 300 ft.

AIRCRAFT AT LANDING OR TAKEOFF (MODE 2B)

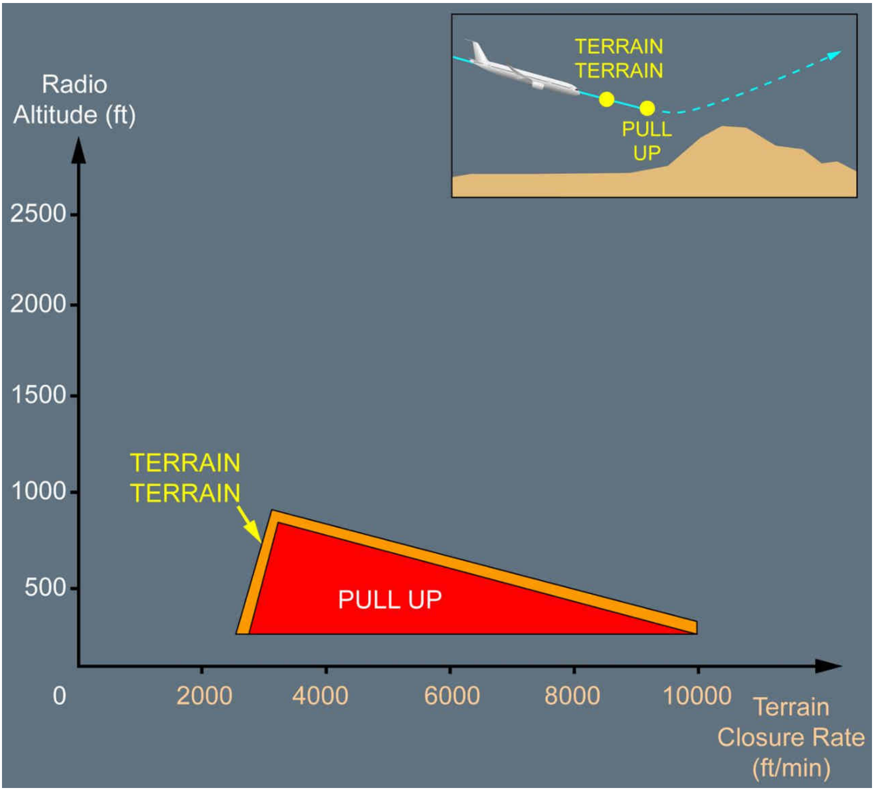
Mode 2B applies, if the aircraft is at low altitude, and:

- The flaps are extended for landing, or
- The aircraft is within 5 NM and 3 500 ft height of the destination, or

- The aircraft is flying an XLS approach, and both glide slope and LOC deviations are below 2 dots, or
- During the first 60 s after takeoff.

L3 This last condition avoids any spurious alerts due to erroneous radio altimeter tracking after takeoff.

Mode 2B



L2 If the aircraft enters the mode 2B envelope, with both the landing gear and the flaps in landing configuration, the following alerts are triggered until the aircraft exits the protection envelope (No “PULL UP” audio indicator):

- The “TERRAIN” audio indicator
- The TERRAIN visual indicator on the PFD.

Ident.: DSC-34-SURV-20-10-10-00003385.0001001 / 30 APR 14

ALTITUDE LOSS AFTER TAKEOFF (MODE 3)

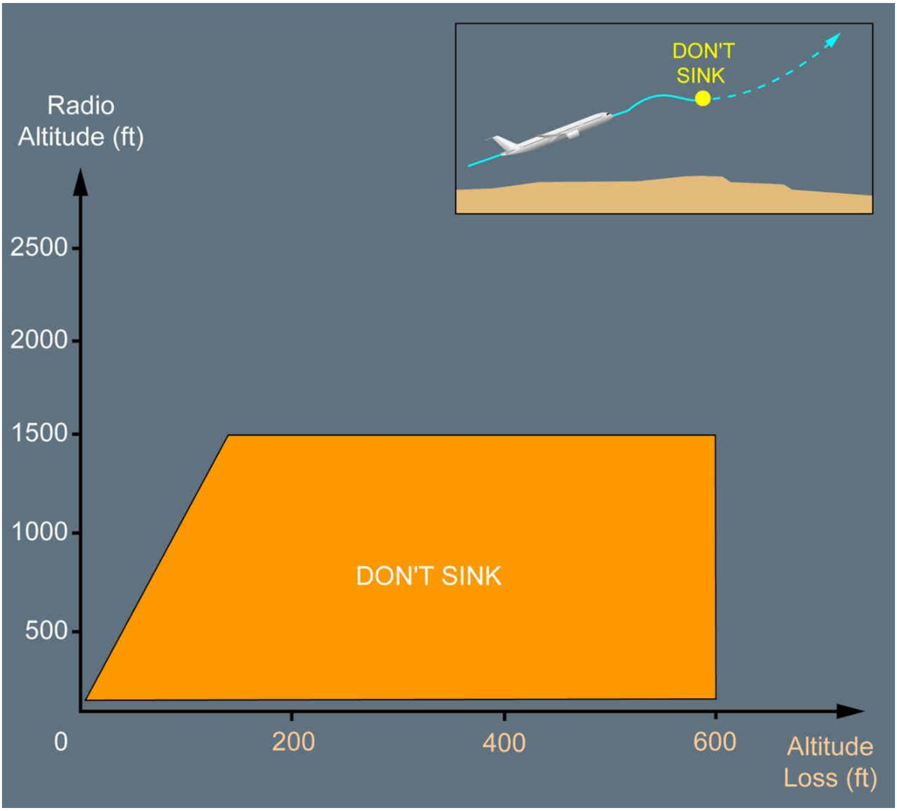
If the GPWS detects an excessive decrease in altitude after takeoff, or during a go-around, when the landing gear or the flaps are not in landing configuration, the following alerts are triggered:

- The “DON’T SINK, DON’T SINK” audio indicator
- The DON'T SINK visual indicator on the PFD.

Both aural and visual indicators stop, if the aircraft gains sufficient altitude.

L2 Mode 3 is inhibited when the aircraft is close to the ground.

Mode 3



Ident.: DSC-34-SURV-20-10-10-00003386.0001001 / 30 APR 14

TERRAIN CLEARANCE NOT SUFFICIENT WHEN NOT IN LANDING CONFIGURATION (MODE 4)

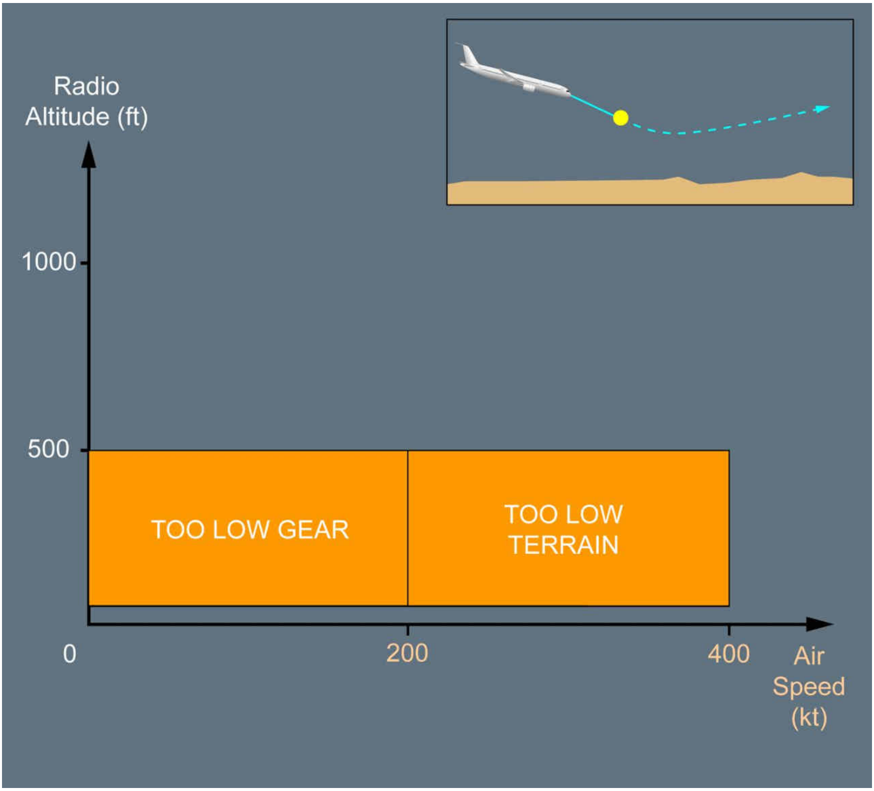
During approach, and depending on the aircraft configuration, mode 4 provides various protections if the terrain clearance is not sufficient.

LANDING GEAR UP AND FLAPS NOT IN LANDING CONFIGURATION (MODE 4A)

If the aircraft approaches terrain with the landing gear up and the flaps not in landing configuration, the following alerts are triggered:
- The “TOO LOW GEAR” audio indicator
- The TOO LOW GEAR visual indicator on the PFD.

In addition, if the aircraft speed is above 200 kt, the following alerts are triggered:
- The “TOO LOW TERRAIN” audio indicator
- The TOO LOW TERRAIN visual indicator on the PFD.

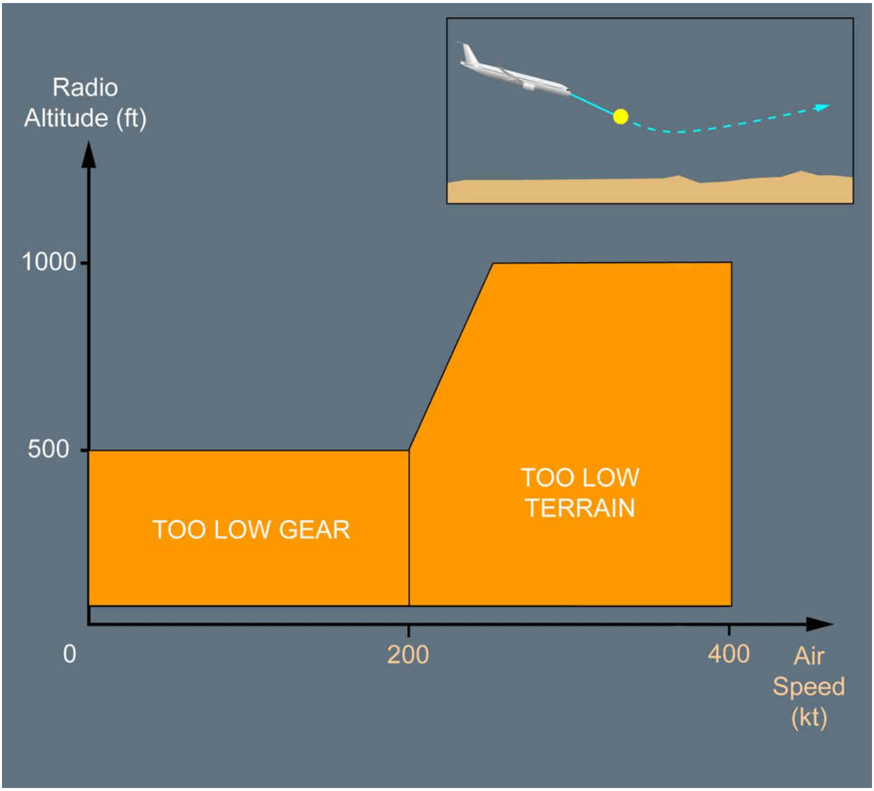
Mode 4A



L2

In addition, if system data (e.g. aircraft position or terrain database) does not enable the flight crew to rely on the TAD function, the mode 4A protection envelope becomes:

Mode 4A and TERR function not operative



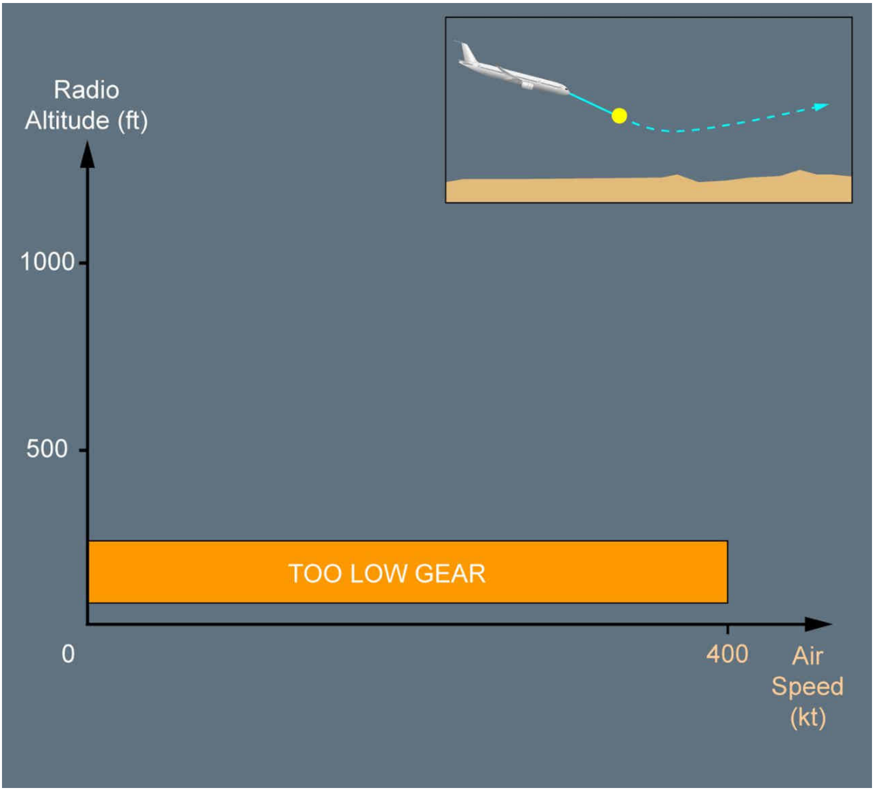
L1

LANDING GEAR DOWN AND FLAPS NOT IN LANDING CONFIGURATION, OR LANDING GEAR UP AND FLAPS IN LANDING CONFIGURATION (MODE 4B)

If the aircraft approaches terrain with the landing gear up and the flaps extended for landing, the following alerts are triggered:

- The “TOO LOW GEAR” audio indicator
- The TOO LOW GEAR visual indicator on the PFD.

Mode 4B Gear Up and Flaps in Landing Configuration



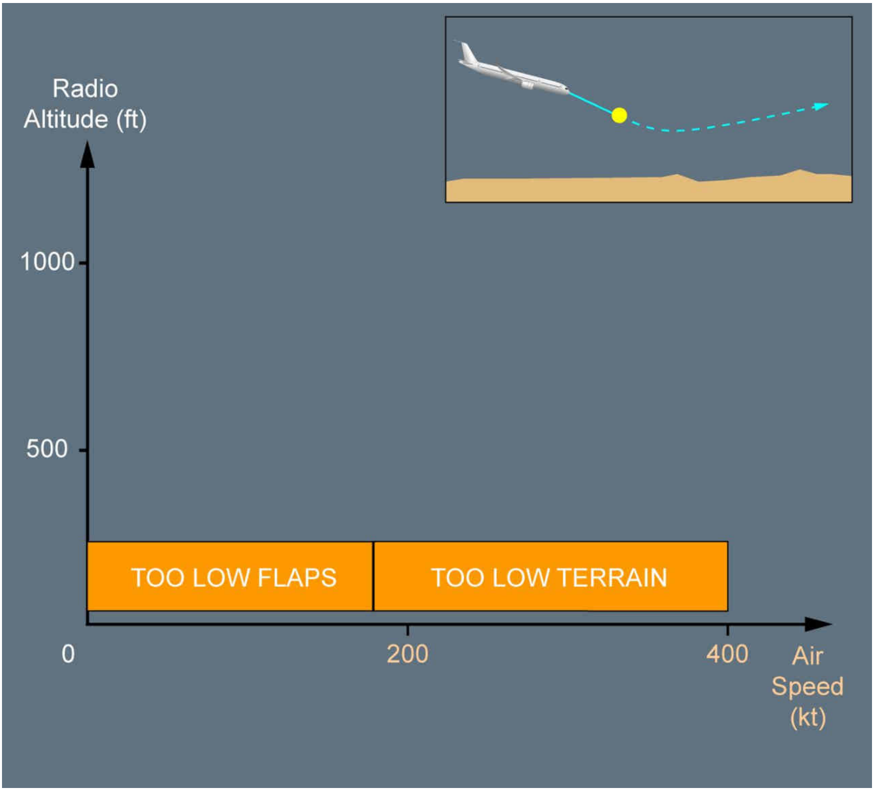
If the aircraft approaches the terrain with the landing gear down and the flaps not in landing configuration, the following alerts are triggered:

- The “TOO LOW FLAPS” audio indicator
- The TOO LOW FLAPS visual indicator on the PFD.

In addition, if the aircraft speed is above 180 kt, the following alerts are triggered:

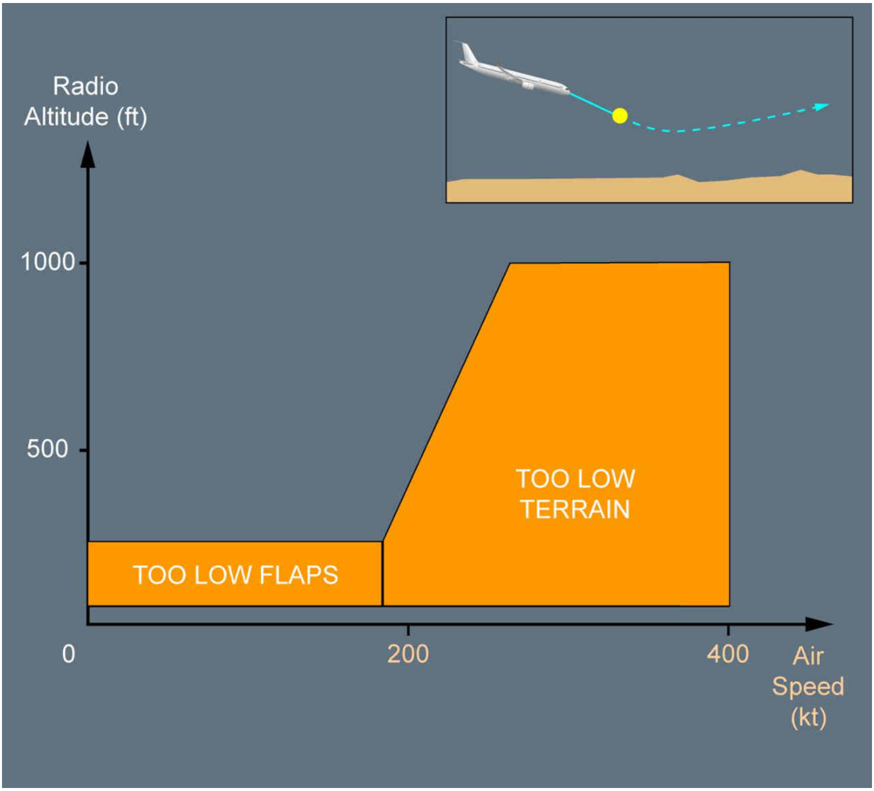
- The “TOO LOW TERRAIN” audio indicator
- The TOO LOW TERRAIN visual indicator on the PFD.

Mode 4B Gear Down and Flaps Not in Landing Configuration



L2 In addition, if system data (e.g. aircraft position or terrain database) does not enable the flight crew to rely on the TAD function, the mode 4B protection envelope becomes:

Mode 4B Gear Down and Flaps Not in Landing Configuration, and TERR Function Not Operative



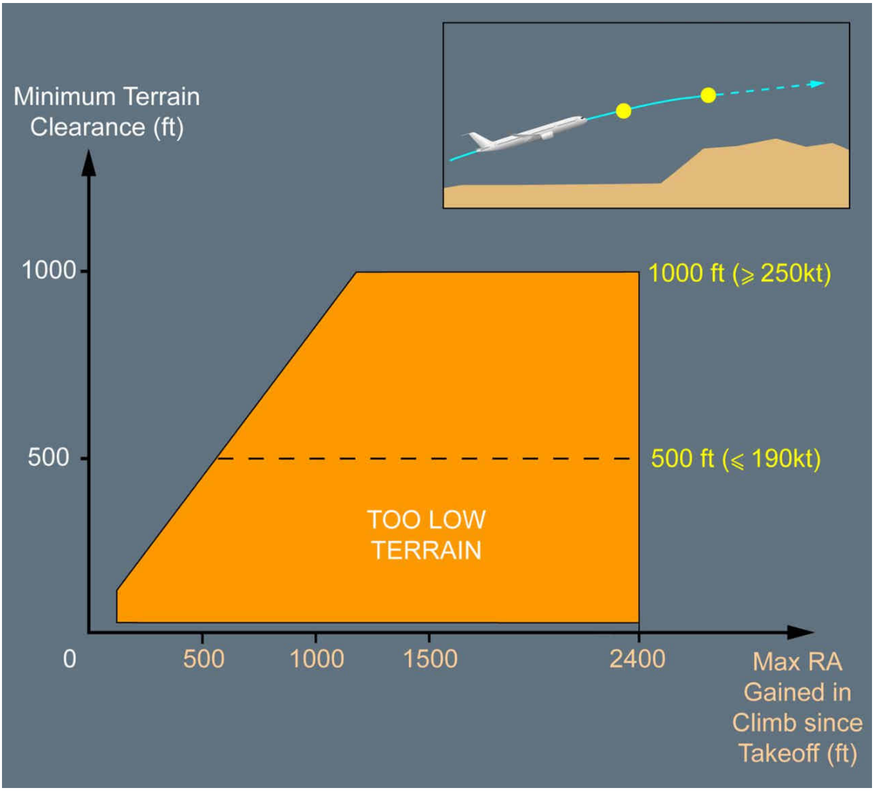
L1 The flight crew can inhibit mode 4B by setting the FLAP MODE button to OFF on the CONTROLS page of the MFD (e.g. in the case of a landing with abnormal flaps configuration).

LANDING GEAR UP OR FLAPS NOT IN LANDING CONFIGURATION (MODE 4C)

As an additional protection for mode 3 (decrease in altitude after takeoff), if the aircraft descends towards terrain during takeoff and climb, with the landing gear up, or if the flaps are not in landing configuration, the following alerts are triggered:
- The “TOO LOW TERRAIN” audio indicator
- The TOO LOW TERRAIN visual indicator on the PFD.

L2 These audio indicators are triggered, if the aircraft goes below 75 % of its current radio-altitude, and enters the protection envelope.

Mode 4C



Ident.: DSC-34-SURV-20-10-10-00003387.0001001 / 30 APR 14

DESCENT BELOW GLIDE SLOPE (MODE 5)

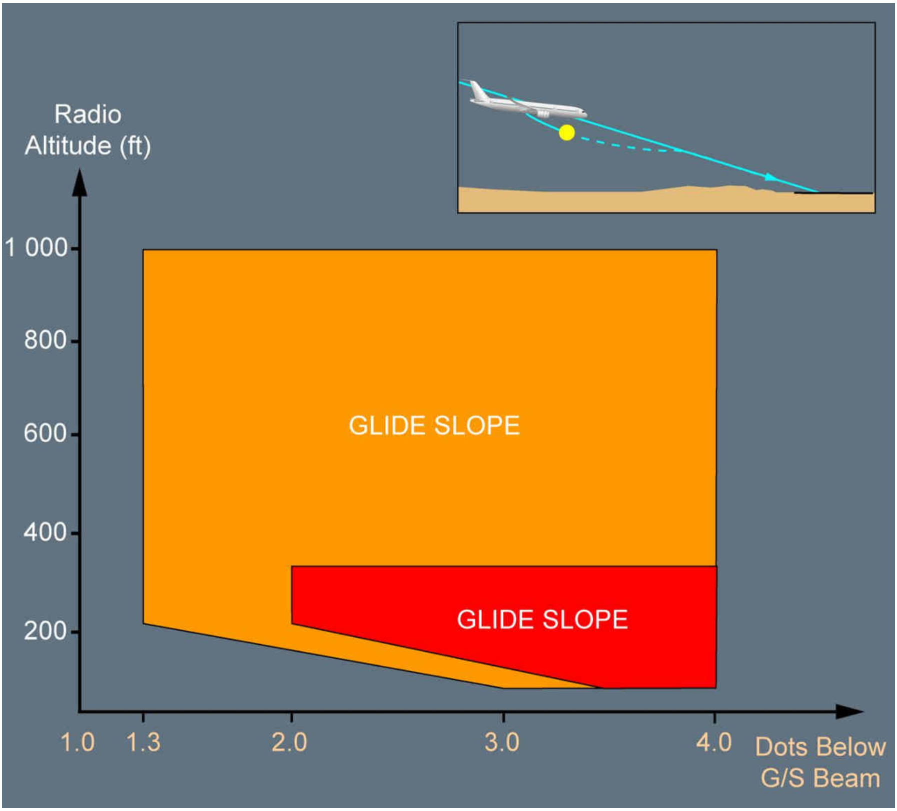
If the aircraft descends below the glide slope by more than 1.3 dots during precision approaches, the following alerts are triggered:

- The “GLIDE SLOPE” aural indicator that repeats as long as the aircraft remains below the glide slope
  If the glide slope deviation is more than 2 dots below 300 ft, the audio indicator becomes louder, and repeats more and more frequently.
- The GLIDE SLOPE visual indicator on the PFD.

L2 Mode 5 is active during approach, if the landing gear is down, and the aircraft is below 1 000 ft AGL.

L1 In order to deactivate mode 5, the flight crew can:
- Set the G/S MODE button to OFF on the CONTROLS page of the MFD, or
- Set the G/S MODE pb to OFF on the SURV panel.

Descent Below Glide Slope



Note: *Usually, the GLIDE SLOPE alert is only triggered, if the landing gear is down. For some airports, the landing gear down condition is not applicable.*

TERRAIN FUNCTION

Applicable to: ALL

Ident.: DSC-34-SURV-20-10-20-00003381.0001001 / 30 APR 14

In addition to the five basic GPWS modes, TAWS also has a TERR function, based on a worldwide database. The TERR function warns the flight crew of potential hazardous conditions with respect to the surrounding terrain.

The TERR function has the following two modes:
- Terrain Awareness and Display (TAD)
  Refer to Terrain Awareness and Display
- Terrain Clearance Floor (TCF).
  Refer to Terrain Clearance Floor

Ident.: DSC-34-SURV-20-10-20-00003388.0001001 / 30 APR 14

PRINCIPLE

The TERR function provides displays and alerts, based on the comparison between the current aircraft position and the TAWS database.

If the flight crew sets the TERR SYS button of the MFD SURV/CONTROLS page to ON, the TERR function provides:
- A horizontal view of the terrain on the ND, if the flight crew presses the TERR pb on the EFIS CP or if the TAWS triggers an alert
  The ND displays terrain in different colors, depending on the terrain altitude in relation to the aircraft altitude.
- A vertical view of the terrain on the VD.

  The VD always displays:
  - Terrain in brown
L2 The color of the terrain does not change depending on relative terrain proximity, nor during terrain or obstacle alerts.
L1
  - Water in blue.

L2 The VD always displays the terrain, even if the TERR pb is not pressed on the EFIS CP.

Ident.: DSC-34-SURV-20-10-20-00003389.0001001 / 12 MAR 15

TERRAIN AWARENESS AND DISPLAY (TAD)

If the TAD detects a terrain or an obstacle collision threat ahead of the aircraft, the following are triggered:

- A caution, if the aircraft is approximately 60 s away from the conflict terrain
- A warning (PULL UP or AVOID), if the aircraft is approximately 30 s away from the conflict terrain.

The TAD function is available in all flight phases, and for all gear and flap configurations.

Note: *On the ND in PLAN mode, with Terrain displayed, a significant delay can be observed when:*
- *A flight crewmember changes the range, or*
- *A flight crewmember scrolls the waypoint list in the F-PLN.*

During this delay, the ND will not display the terrain.

L2 PROTECTION ENVELOPE

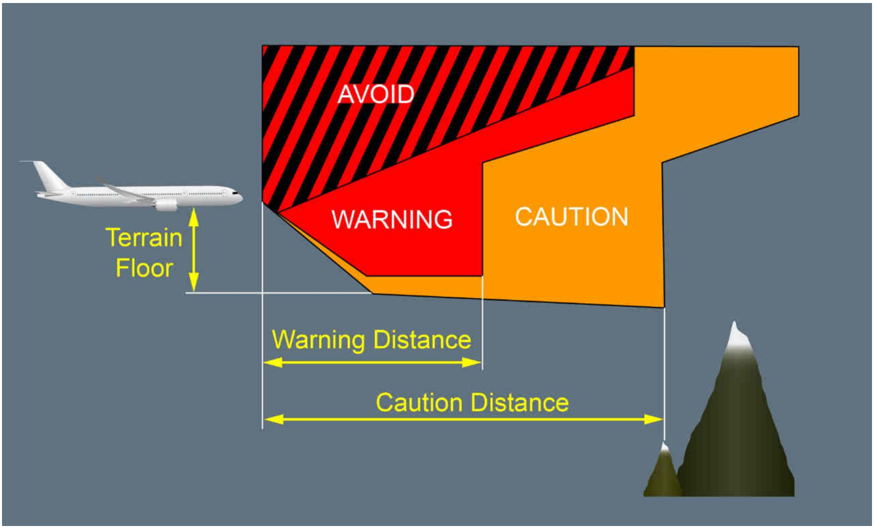
The TAD computes a caution envelope and a warning envelope, based on:

- The aircraft altitude
- Aircraft performances
- The nearest runway altitude
- The range of the nearest collision threats
- The ground speed
- The turn angle.

VERTICAL ENVELOPE

Warning and caution envelopes change, depending on the ground speed and the turn angle.

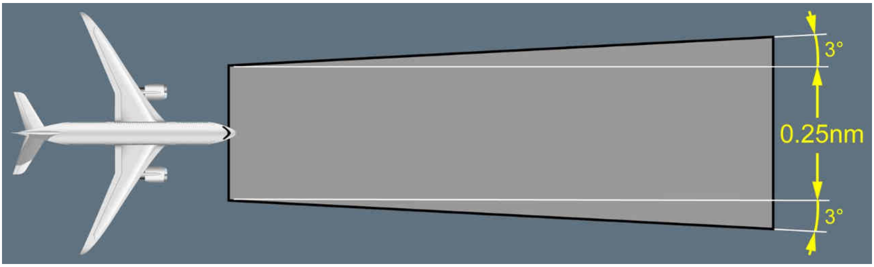
Vertical Envelope



AVOID
WARNING
CAUTION
Terrain Floor
Warning Distance
Caution Distance

HORIZONTAL ENVELOPE

Horizontal Envelope



Note: *When the aircraft turns, the horizontal envelope changes to take into account the flight path of the aircraft.*

L1 AUTO RANGE/MODE

The AUTO RANGE/MODE function automatically changes the ND setting to the most appropriate range and mode, in particular for specific operational situations.
In the case of terrain or obstacle alert, the ND automatically changes range to 10 NM and mode to ARC. The ND displays the AUTO RANGE/MODE message.

TERRAIN ALERTS

If the TAD detects a terrain collision threat ahead of the aircraft, the following are triggered:

- The “TERRAIN AHEAD, TERRAIN AHEAD” audio indicator that repeats every 7 s, until the terrain is no longer a threat
- The TERRAIN visual indicator on the NDs

L2 The TERR pb is also automatically pressed on the EFIS CP.

L1
- Yellow areas on the NDs, that indicate a terrain conflict with the caution criteria.

If the aircraft continues to approach the terrain, the following are triggered:

- The “TERRAIN AHEAD, PULL UP” audio indicator, that repeats continuously, until the terrain is no longer a threat
- The PULL UP visual indicator on the PFDs
- The TERRAIN visual indicator on the NDs
- Red areas on the NDs, that indicate a terrain conflict with the warning criteria.

If the aircraft continues to approach the terrain after the PULL UP alert, the following are triggered:

- The “AVOID TERRAIN” audio indicator, that repeats continuously, until the terrain is no longer a threat
- The AVOID TERRAIN visual indicator on the PFDs
- The TERR AHEAD visual indicator on the NDs
- Red areas with black stripes on the NDs, that indicate a terrain conflict with the warning criteria.

OBSTACLE ALERTS

If the TAD detects an obstacle collision threat ahead of the aircraft, the following are triggered:

- The “OBSTACLE AHEAD, OBSTACLE AHEAD” audio indicator, that repeats every 7 s until the obstacle is no longer a threat
- The OBST visual indicator on the NDs
- The  symbol on the NDs, that indicates an obstacle conflict with the caution criteria.

L2 The point indicates the location of the obstacle.
The TERR pb is also automatically pressed on the EFIS CP.

L1 If the aircraft continues to approach the obstacle, the following are triggered:

- The “OBSTACLE AHEAD, PULL UP” audio indicator, that repeats continuously until the obstacle is no longer a threat
- The PULL UP visual indicator on the PFDs
- The OBST visual indicator on the NDs
- The  symbol on the NDs, that indicates an obstacle conflict with the warning criteria.

L2 The point indicates the location of the obstacle.

L1 If the aircraft continues to approach the obstacle after the PULL UP alert, the following are triggered:

- The “AVOID OBSTACLE” audio indicator, that repeats continuously, until the terrain is no longer a threat
- The AVOID OBSTACLE visual indicator on the PFDs
- The OBST AHEAD visual indicator on the NDs
- The ▲ symbol on the NDs, that indicates an obstacle conflict with the warning criteria.

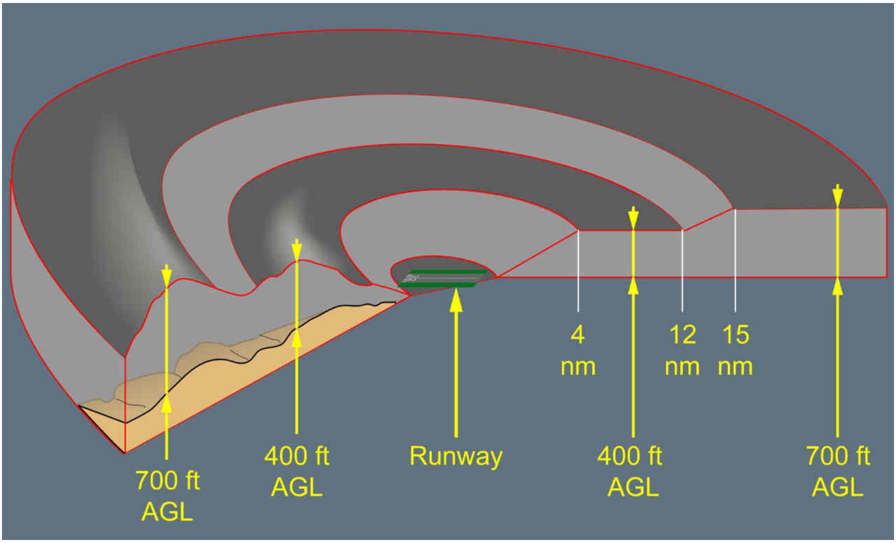
L2 The point indicates the location of the obstacle.

Ident.: DSC-34-SURV-20-10-20-00003390.0001001 / 30 APR 14

TERRAIN CLEARANCE FLOOR (TCF)

The TCF function computes a terrain clearance envelope around the airport runway. This function enhances the GPWS mode 4, by triggering an alert if the terrain clearance is not sufficient, even when the aircraft is in landing configuration.
The TCF function also protects against an attempt to land where there is no airfield.
The TAWS database includes the applicable TCF envelope for each airport runway that has terrain data, and that is longer than 1 067 m (3 500 ft).
The TCF function is active during all the following flight phases: Takeoff, cruise and approach.

TCF Envelope



If the aircraft descends below the protection envelope, the following are triggered:

- The “TOO LOW TERRAIN, TOO LOW TERRAIN” audio indicator, if the aircraft enters the envelope

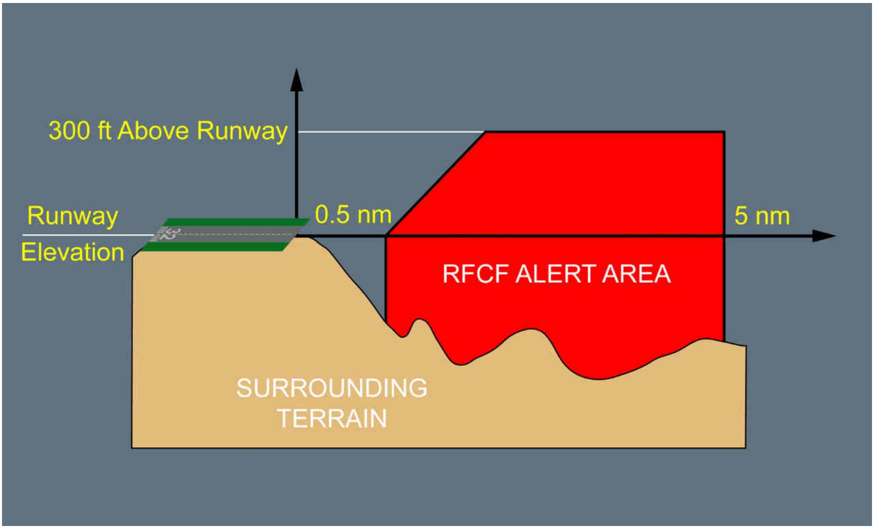
L2 If the aircraft continues to descend below the envelope, the alert is triggered one time for every 20 % degradation in radio altitude.

L1
- The TOO LOW TERRAIN visual indicator on the PFD.

L2 RUNWAY FIELD CLEARANCE FLOOR (RFCF)

The RFCF function provides an additional protection envelope for runways that are significantly higher than the surrounding terrain.
The envelope is a circular band within 5 NM of the runway, and it is based on the geometric altitude and the runway elevation.
If the aircraft descends below this protection envelope, the "TOO LOW TERRAIN" audio and visual indicators are triggered.

RFCF



TAWS DATABASE

Ident.: DSC-34-SURV-20-10-00003391.0001001 / 30 APR 14
Applicable to: ALL

The TAWS database divides the earth surface into grid cells.

L3 These cells are defined by longitude and latitude data, in the World Geodetic System WGS 84.

L1 Each cell contains the highest terrain altitude within the associated terrain area.

The grid resolution varies, depending on the geographic location:
- 0.25 NM × 0.25 NM
- 0.5 NM × 0.5 NM
- 1 NM × 1 NM
- 2 NM × 2 NM
- 5 NM × 5 NM.

The highest resolution (0.25 NM × 0.25 NM) is used for airports areas to accurately reflect the terrain. The lowest resolution (5 NM × 5 NM) is used for non-airport areas, where terrain features are not a collision threat.

The TAWS database has:
- A terrain database
- An obstacle database

L2 The obstacle database includes the location and height of all man-made obstacles that are above 100 ft surrounding terrains.

L1
- An aircraft performance database

L2 The aircraft performance database is used to compute the climb capability of the aircraft.

L1
- A runway database

L2 The runway database includes the length and name of all hard surface runways worldwide that are 3 500 ft long or more. In addition, this database includes information about the runway orientation, elevation, and mean slope.

L1
- An envelope modulation database.

L2 The TAWS uses the envelope modulation database to adapt alert protections to specific areas in the world, in order to improve nuisance margins.

L1 Updating the TAWS database is the vendor's responsibility.

L3 The vendor may use one or more of the following data sources:
- Data from government and/or regulatory agencies
- Data from airlines that have surveyed an airport, while establishing layout, approach, or departure procedures,
- Data from commercial vendors that also produce data sets for FMS and other navigation systems
- Data from commercial and military surveying agencies, when available
- Airport layout and physical properties from high resolution maps and/or digitized data sources
- Airport layout and physical properties from imagery.

L1 Review the manufacturer document "EGPWS Terrain Database Airport Coverage List", to have official information about the most recent TAWS database, and the list of included airports.

Applicable to: ALL

Audio Indicator	Condition or Cause	Duration
Don't Sink (Synthetic Voice)	*Refer to DSC-34-SURV-20-10 Altitude Loss After Takeoff (Mode 3)*.	Is repeated if the situation continues to degrade.
Glideslope (Synthetic voice)	*Refer to DSC-34-SURV-20-10 Descent Below Glide Slope (Mode 5)*.	Is repeated as long as the aircraft is below the glide slope.
Obstacle Ahead (Synthetic voice)	*Refer to DSC-34-SURV-20-10 Terrain Awareness and Display*.	Is repeated each 7 s until the obstacle is no longer a threat.
Obstacle Ahead, Pull Up (Synthetic voice)	*Refer to DSC-34-SURV-20-10 Terrain Awareness and Display*.	Is repeated continuously until the obstacle is no longer a threat.
Pull Up (Synthetic voice)	- *Refer to DSC-34-SURV-20-10 Excessive Rate of Descent (Mode 1)*, or - *Refer to DSC-34-SURV-20-10 Excessive Terrain Closure Rate (Mode 2)*.	- Is repeated as long as the aircraft descends at an excessive rate, or - Is repeated as lon as the aircraft has an excessive terrain closure rate.
Sink Rate (Synthetic voice)	*Refer to DSC-34-SURV-20-10 Excessive Rate of Descent (Mode 1)*.	Is repeated if the situation continues to degrade.
Terrain (Synthetic voice)	*Refer to DSC-34-SURV-20-10 Excessive Terrain Closure Rate (Mode 2)*.	Is repeated when returning from the warning envelope (Pull Up) to the caution envelope of GPWS Mode 2, until the terrain clearance stops decreasing.
Terrain, Terrain (Synthetic voice)	*Refer to DSC-34-SURV-20-10 Excessive Terrain Closure Rate (Mode 2)*.	Is repeated until the aircraft exits the protection envelope.
Terrain Ahead, Terrain Ahead (Synthetic voice)	*Refer to DSC-34-SURV-20-10 Terrain Awareness and Display*.	Is repeated each 7 s until the terrain is no longer a threat.
Terrain Ahead, Pull Up (Synthetic voice)	*Refer to DSC-34-SURV-20-10 Terrain Awareness and Display*.	Is repeated continuously until the terrain is no longer a threat.
Too low, flaps (Synthetic Voice)	*Refer to DSC-34-SURV-20-10 Not Sufficient Terrain Clearance (Mode 4)*.	Is repeated if the situation continues to degrade.
Too low gear (Synthetic voice)	*Refer to DSC-34-SURV-20-10 Not Sufficient Terrain Clearance (Mode 4)*.	Is repeated if the situation continues to degrade.
Too Low, Terrain (Synthetic voice)	- *Refer to DSC-34-SURV-20-10 Not Sufficient Terrain Clearance (Mode 4)*, or - *Refer to DSC-34-SURV-20-10 Terrain Clearance Floor*.	Is repeated if the situation continues to degrade.

TAWS LABEL

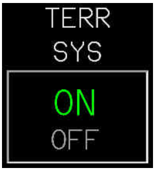
TAWS	TAWS (GPWS and TERR) is on.

L12

TAWS is failed.
Associated with the SURV TAWS FAULT ECAM alert, *Refer to procedure*.

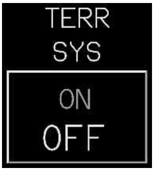
Ident.: DSC-34-SURV-20-20-40-00003405.0001001 / 06 AUG 14

TERR SYS BUTTON



The TERR function is on.
TAD and TCF modes are operative.
Both VDs display the terrain profile.

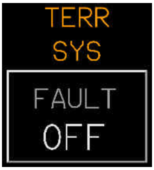
L12



The TERR function is off.
TAD and TCF modes are not available.
None of the VDs display the terrain profile.

Associated with:
- The TERR SYS OFF memo
- The TERR SYS OFF message on the ND.

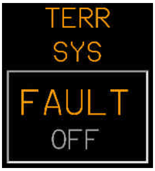
L12



The TAWS is failed and the TERR function is off.

Associated with:
- The SURV TAWS FAULT ECAM alert, *Refer to procedure*, or
- The SURV TERR SYS FAULT ECAM alert, *Refer to procedure*.

L12



The TAWS and/or TERR function are failed.

Associated with:
- The SURV TAWS FAULT ECAM alert, *Refer to procedure*, or
- The SURV TERR SYS FAULT ECAM alert, *Refer to procedure*.

AUTO RANGE/MODE MESSAGE

AUTO RANGE/MODE	Appears in the case of terrain or obstacle alert, and the ND automatically changes range to 10 NM and mode to ARC.

Ident.: DSC-34-SURV-20-20-20-00003417.0001001 / 30 APR 14

ND SETTING MESSAGES

If the AUTO RANGE/MODE function is not available, the following ND setting messages appear.

TERR: CHANGE MODE	Appears in PLAN mode, when the TAWS triggers a caution.
TERR: CHANGE MODE	Appears in PLAN mode, when the TAWS triggers a warning.
TERR: INCREASE RANGE	Appears in ARC or ROSE mode, when: - The flight crew sets the range selector to ZOOM - The TAWS triggers a caution.
TERR: INCREASE RANGE	Appears in ARC or ROSE mode, when: - The flight crew sets the range selector to ZOOM - The TAWS triggers a warning.
TERR: REDUCE RANGE	Appears in ARC or ROSE mode, when: - The flight crew selects a range on the EFIS CP that is greater than 160 NM - The TAWS triggers a caution.
TERR: REDUCE RANGE	Appears in ARC or ROSE mode, when: - The flight crew selects a range on the EFIS CP that is greater than 160 NM - The TAWS triggers a warning.

G/S MODE pb

The G/S mode (mode 5) is active.
This is the default position.
On the SURV/CONTROLS page of the MFD, the G/S MODE button is automatically set to ON.

L12

The flight crew turns off the G/S mode (mode 5).
Associated with the TAWS GS MODE OFF memo.
On the SURV/CONTROLS page of the MFD, the G/S MODE button is automatically set to OFF.

Ident.: DSC-34-SURV-20-20-50-00003402.0001001 / 30 APR 14

VD AZIM knob

L12

- When pushed, selects the AUTO mode.
  This is the default position.
- When pulled, selects the manual AZIM mode.

  On the VD:
  - The eye symbol appears, instead of the aircraft symbol
  - The terrain appears along the selected azimuth.

  The ND displays a straight white line based on the selected azimuth value.
- When turned, adjusts the AZIM value in degrees.
  The AZIM value is limited to ±60 ° around the current heading.
  The VD displays the selected AZIM value in the VIEW ALONG AZIMUTH message.
  The AZIM line moves on the ND, based on the flight crew's selection.

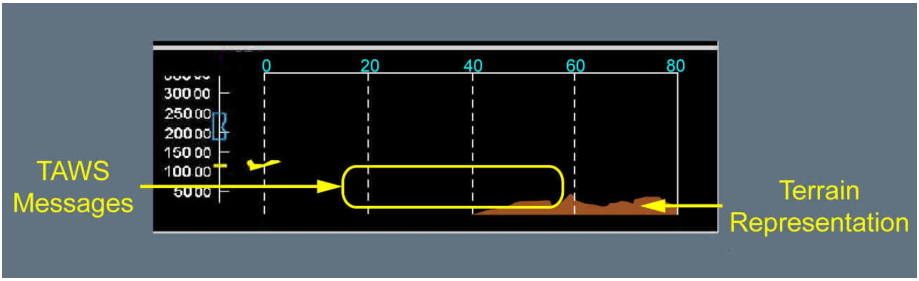
  Note: *The flight crew can preset the AZIM value before pulling the VD AZIM knob.*

VD

Applicable to: ALL

Ident.: DSC-34-SURV-20-20-30-00003397.0001001 / 30 APR 14

VD



Note: VD range is always limited to 160 NM.

Ident.: DSC-34-SURV-20-20-30-00003418.0001001 / 05 MAY 14

TERRAIN REPRESENTATION

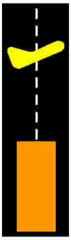
The VD provides the terrain profile along:
- The solid green line displayed on the ND, or
- The solid white line displayed on the ND, if the flight crew has selected the manual AZIM mode of the WXR.

The VD always displays:
- Terrain in brown

L2 The color of the terrain does not change depending on relative terrain proximity, nor during terrain or obstacle alerts.

L1
- Water in blue.

If the TERR function is operative, the VD continuously displays the terrain.



Indicates the real location of the terrain. The zone elevation in amber is based on the measured radio-altimeter information.
Appears when the aircraft radio-altimeter altitude is below 5 000 ft.

L2 For more information on the terrain profile on the VD, *Refer to DSC-31-CDS-40-50 Terrain Profile*.

TAWS MESSAGES

L12

NO TERR & WX DATA AVAIL	Appears when: - The flight crew selects the PLAN mode on the EFIS CP, or - The flight crew sets the TERR SYS button to OFF on the CONTROLS page of the MFD, or The VD does not display the weather when the TERR function is not available, because it cannot locate the weather vertically (i.e. with respect to the terrain). - The aircraft latitude is above 80 ° (North or South).
TERR INOP	Appears when the TAWS has failed.
VIEW ALONG AZIM XXX°	The message is associated with the azimuth value, when the flight crew selects the manual AZIM mode.

OVERVIEW

Ident.: DSC-34-SURV-30-10-00003421.0001001 / 06 NOV 19
Applicable to: ALL

The Weather Radar (WXR) system has:
- A weather (WX) display function
- A Turbulence (TURB) detection function
- A weather hazard prediction function ◁✳
- A weather ahead function
- A Predictive Windshear (PWS) function
- A ground mapping function.

The WXR is armed on ground when the WXR/PWS button has been set to AUTO on the MFD page.

When armed, the WXR will start to scan the envelope ahead of the aircraft if both of the following conditions are met:
- At least one engine is running
- The WX pb is selected on at least one EFIS CP.

Note: *The WXR is automatically activated (will start to scan the envelope ahead of the aircraft) when engine takeoff power thrust is applied. However if the flight crew does not press the WX pb on the EFIS CP , there will be no display on the ND or the VD. The PWS and WX image will be displayed automatically on the ND and VD, only if windshear is detected.*

The WXR is automatically shut down:
- 60 s after landing, or
- When the aircraft is on ground and no engine running, or
- When the aircraft is on ground and the flight crew retract the flaps.

WX DISPLAY FUNCTION

Applicable to: ALL

Ident.: DSC-34-SURV-30-10-10-00003422.0001001 / 30 APR 14

The WX display function enables the flight crew to view precipitation in different colors, depending on the intensity of the precipitation.

The WX display function has several modes, that enable the flight crew to analyze the weather along the vertical and horizontal axes:
- The automatic (AUTO) mode
  This is the default mode of the WXR.
- The elevation (ELEVN) mode
- The tilt (TILT) mode

- The azimuth (AZIM) mode
- The gain (GAIN) mode.

The WX display function displays weather data on:
- The ND: For views along the vertical flight path (in AUTO mode), or along the selected altitude (in ELEVN mode), or along the selected tilt angle (in TILT mode)
- The VD: For views along the lateral flight path in (AUTO mode), or along the selected azimuth (in AZIM mode).

Ident.: DSC-34-SURV-30-10-10-00003426.0001001 / 06 NOV 19

PRINCIPLE

The WXR detects precipitation in the surrounding area, by using the WXR antenna.

L2 The WXR does not detect:
- Cloud, fog, or wind (droplets are too small, or no precipitation at all)
- Clear air turbulence (no precipitation)
- Sandstorms (solid particles are almost transparent to the radar beam)
- Lightning.

The WXR detects:
- Rainfall
- Wet hail and wet turbulence
- Ice crystals, dry hail, and dry snow. However, these three elements give small reflections
- Areas with high probability of lightning, with the weather hazard prediction function ⊲ .

L1 The WXR continuously scans a volume of space ahead of the aircraft, and stores this data in a three dimensional (3D) buffer.

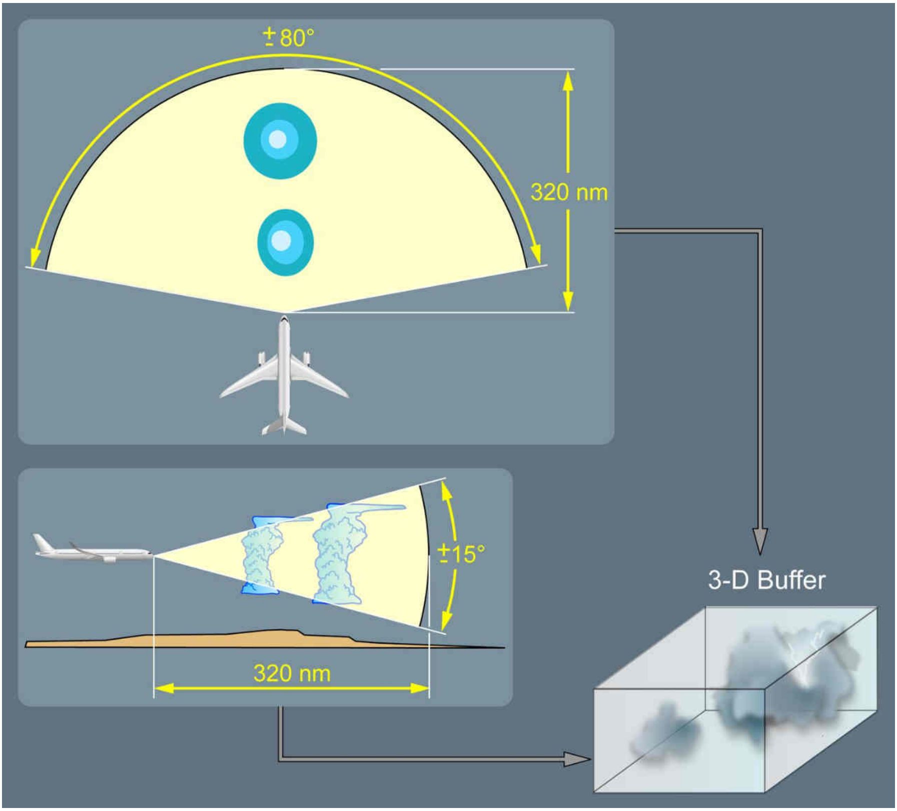
L2 The WXR antenna scans:
- ±80 ° in azimuth
- ±15 ° in tilt
- Up to 320 NM in front of the aircraft.

The 3D buffer stores the weather data up to 5 min behind the aircraft.

L1 The WXR extracts data from the 3D buffer, in order to display the weather on the ND, and on the VD.

L3 The WXR takes into account the curvature of the earth, to display an image based on the mean sea level. It also reduces the ground returns from the displayed weather, by using the terrain data provided by the TAWS database.

WXR Principle



Ident.: DSC-34-SURV-30-10-10-00003427.0002001 / 03 SEP 19

AUTOMATIC (AUTO) MODE

The automatic mode (AUTO) is the default mode of the WXR.
The WXR extracts the weather data from the 3D buffer, along the aircraft flight path.

The WXR takes into account a vertical envelope along the aircraft vertical flight path, in order to display on the ND:

- The on-path weather that the aircraft will encounter (i.e. weather inside the envelope)
  The on-path weather appears on the ND in the conventional colors.
- The off-path weather that is not on the aircraft trajectory (i.e. weather outside the envelope).
  The off-path weather appears on the ND in black parallel lines, with reduced intensity.

For more information about the on-path envelope boundaries, *Refer to DSC-34-SURV-30-10 On Path Envelope Boundaries Definition*.

L3 The aircraft vertical flight path is:
- The FMS flight plan limited by the selected altitude on the AFS CP, if the VD is defined along the FMS trajectory, or
- The flight path extrapolated using the current Flight Path Angle (FPA), and limited by the selected altitude on the AFS CP, if the VD is not defined along the FMS trajectory, or
- The flight path extrapolated up to 60 NM, using the Flight Path Angle (FPA), and limited to the altitude at 60 NM, if the selected altitude is not available.

L2 The WXR may not be able to discriminate the on-path and the off-path weather at ranges above 160 NM, because of the angle of the antenna beam width. The WXR could consider some off-path weather as on-path weather.

L1 For the display on the VD, the WXR extracts the data from the 3D buffer, along the zero-width vertical cut.

L2 For more information about the vertical cut, *Refer to DSC-31-CDS-40-50 VD*.

Ident.: DSC-34-SURV-30-10-10-00003428.0001001 / 30 APR 14

MANUAL ELEVN AND TILT MODES

The manual ELEVN mode enables the flight crew to analyze the weather at a selected altitude.

L2 The selected altitude depends on the barometric reference selected by the flight crew.

L1 The manual TILT mode enables the flight crew to analyze the weather at a selected tilt angle.

L2 Zero tilt value indicates the horizon as seen by the ADIRS.

L1 Depending on the flight crew selection, the WXR extracts data from the 3D buffer:
- At a selected altitude, or
- At a selected tilt angle.

The WXR displays the extracted data on the ND.

The flight crew can select these modes by using:
- The ELEVN knob on the SURV panel

  L2 For more information on the ELEVN knob, *Refer to DSC-34-SURV-30-20 ELEVN/TILT Knob*.

L1
- The ELEVN/TILT option list on the CONTROLS page of the MFD.

  L2 For more information about the ELEVN/TILT option list, *Refer to DSC-34-SURV-30-20 ELEVN/TILT Option List*.

L1 The flight crew must return to the automatic mode when they have completed the analysis.

Ident.: DSC-34-SURV-30-10-10-00003429.0001001 / 30 APR 14

MANUAL AZIMUTH (AZIM) MODE

The manual AZIM mode provides a vertical view of the weather along a selected azimuth.

The WXR extracts data from the 3D buffer along the selected azimuth, and displays the extracted weather on the VD.
The flight crew can select the manual AZIM mode by pulling the VD AZIM knob of the SURV panel.
L2 For more information about the VD AZIM knob, *Refer to DSC-34-SURV-30-20 VD AZIM Knob*.
The WXR automatically returns to the AUTO mode after 30 s, if the flight crew does not select any azimuth value.

Ident.: DSC-34-SURV-30-10-10-00003430.0001001 / 30 APR 14

MANUAL GAIN MODE

The manual GAIN mode enables the flight crew to adjust sensitivity of the weather display on the ND.

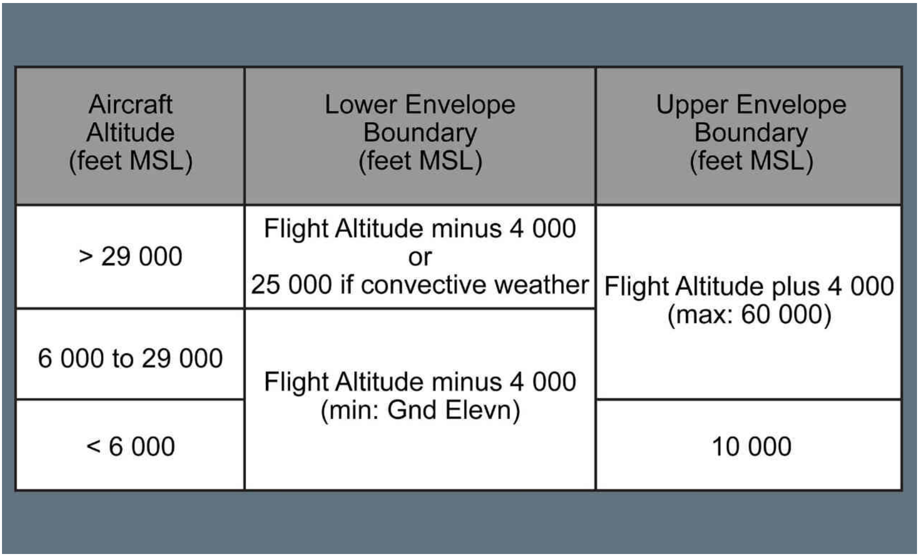
The flight crew can select the manual GAIN mode by using:
- The GAIN knob on the SURV panel
  L2 For more information on the GAIN knob, *Refer to DSC-34-SURV-30-20 GAIN Knob*.
- L1 The GAIN button on the CONTROLS page of the MFD.
  L2 For more information on the GAIN button, *Refer to DSC-34-SURV-30-20 GAIN Button*.

ON PATH ENVELOPE BOUNDARIES DEFINITION

Ident.: DSC-34-SURV-30-10-00025208.0001001 / 03 SEP 19
Applicable to: ALL

In automatic mode, the radar takes into account a vertical envelope along the vertical flight path of the aircraft. It defines if the weather echo is on the aircraft flight path or not.

ON PATH envelope limits



Aircraft Altitude (feet MSL)	Lower Envelope Boundary (feet MSL)	Upper Envelope Boundary (feet MSL)
> 29 000	Flight Altitude minus 4 000 or 25 000 if convective weather	Flight Altitude plus 4 000 (max: 60 000)
6 000 to 29 000	Flight Altitude minus 4 000 (min: Gnd Elevn)	
< 6 000		10 000

The basic ON PATH envelope is bounded at plus and minus 4 000 ft of the reference flight path.

The reference flight path is defined as follows:
- For the first 60 NM, the current speed vector is extrapolated ahead of the aircraft, based on the ratio between vertical speed and ground speed
- Beyond 60 NM, the reference flight path is a levelled flight path.

At high altitude, when the weather radar detects convective weather, the lower boundary of the ON PATH envelope is lowered to 25 000 ft around the convective weather.
The upper boundary of the ON PATH envelope is set at 10 000 ft when the aircraft is below 6 000 ft.
The below paragraphs give the detailed definition of the ON PATH envelope by flight phase.

CLIMB PATH

During climb, the top of the ON PATH envelope is 4 000 ft above the expected flight path. The lower boundary is located 4 000 ft below the half of the expected flight path angle (γ).
However, at high altitude, when the weather radar detects convective weather, the lower envelope boundary is lowered to 25 000 ft around the convective weather.

LEVEL FLIGHT

During level flight, the ON PATH envelope extends from 4 000 ft above to 4 000 ft below the aircraft altitude. However, when the weather radar detects convective weather, the lower envelope boundary is lowered to 25 000 ft around the convective weather. The upper boundary cannot be lower than 10 000 ft.

TURBULENCE DETECTION (TURB) FUNCTION

Ident.: DSC-34-SURV-30-10-00003423.0001001 / 06 NOV 19
Applicable to: ALL

The turbulence detection (TURB) function detects wet turbulence in a volume of space ahead of the aircraft.

L3 This function is based on the movement of precipitation.

L2 The TURB detection function scans:
- ±60 ° in azimuth
- Between 0 ft and 60 000 ft MSL
- Up to 60 NM in front of the aircraft.

L1 *Note:* *The TURB function does not detect clear air turbulence or dry turbulence.*

TURB detection is available, if:
- The WXR is operative
- The flight crew sets the TURB button to AUTO, or ticks the TURB tick box on the SURV/CONTROLS page of the MFD.

The ND and VD display the areas of turbulence in magenta.

WEATHER HAZARD PREDICTION FUNCTION

Ident.: DSC-34-SURV-30-10-00025314.0001001 / 06 NOV 19
Applicable to: ALL

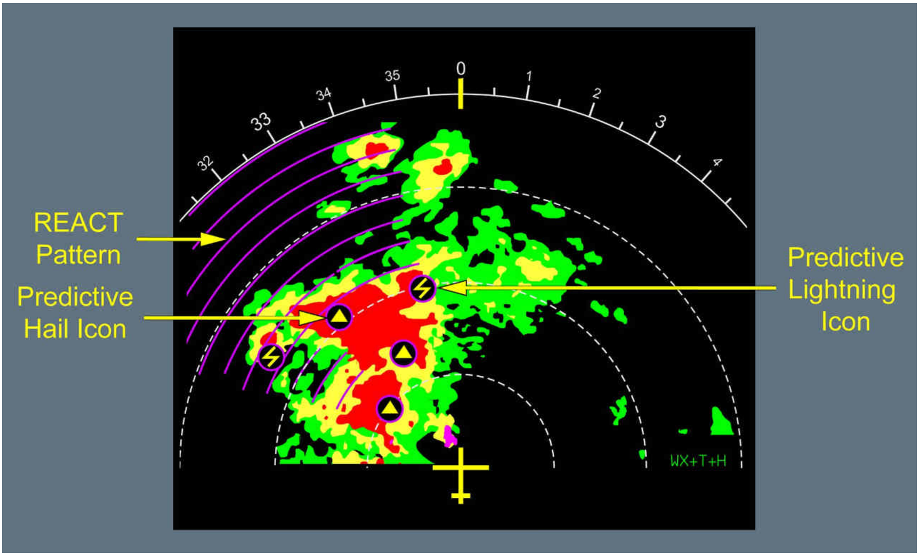
The weather hazard prediction function:
- Computes an automatic threat assessment of the lightning, hail and convective activity in a storm cell and in the area near the storm cell, up to 160 NM in front of the aircraft. The zones with high probability of lightning or hail are represented by specific icons in addition to the basic reflectivity colors
- Is able to detect areas of severe signal attenuation with the Rain Echo Attenuation Compensation Technique (REACT).

The weather hazard prediction function is available, if:
- The WXR is operative
- The flight crew ticks the HZD tick box on the SURV/CONTROLS page of the MFD.

L2 REACT is available and REACT patterns can be displayed on the ND even if the flight crew does not tick the HZD tick box on the SURV/CONTROLS page of the MFD.

L1 When the weather hazard prediction function is on, the ND displays weather hazard prediction indications.

Note:
- *The VD does not display weather hazard prediction indications*
- *The ND does not display weather hazard prediction indications when the flight crew selects the ground mapping function.*



The predictive lightning and hail icons generally appear on red weather but may appear also on green/yellow weather, indicating the building of a convective threat. Each icon is located at the center of the threat area.
Areas of severe signal attenuation detected by the REACT are indicated by a distinct pattern of magenta concentric arcs on top of basic weather reflectivity.

WEATHER AHEAD FUNCTION

Ident.: DSC-34-SURV-30-10-00011691.0001001 / 07 NOV 16
Applicable to: ALL

The weather ahead function improves awareness of potential weather or turbulence hazard.

The weather ahead function:
- Detects weather or turbulence hazard 3 min ahead of the aircraft
- Triggers crew awareness.

The weather ahead function is available when the WXR is on.

AWARENESS TRIGGERING CONDITIONS

The weather ahead function triggers crew awareness, in the case of:
- Red or yellow weather in the detection area, or
- Turbulence in the detection area.

The detection area depends on the type of lateral guidance, NAV mode or HDG/TRACK mode.

The detection area is:
- 3 min ahead of the aircraft
- In a corridor of 2 NM on each side of the current track
- In a corridor of 4 000 ft above and below the current track.

TRIGGERING OF AWARENESS

BELOW 1 500 FT

The WEATHER AHEAD message and the audio indicator are inhibited.

ABOVE 1 500 FT

All of the following occur:

- The ND displays the WEATHER AHEAD message
- If WX is off, on both EFIS CP, the weather ahead function triggers the “WEATHER AHEAD” audio indicator.

PREDICTIVE WINDSHEAR (PWS) FUNCTION

Ident.: DSC-34-SURV-30-10-00003424.0001001 / 05 JUN 18
Applicable to: ALL

The Predictive Windshear (PWS) function:

- Detects windshears:
  - At least 10 s before a possible encounter
  - Between 0.5 NM and 5 NM in front of the aircraft
- Triggers alerts.

L3 The PWS function can detect and display up to 8 different windshears simultaneously.

L1 *Note:* *The PRIMs also provide a reactive windshear function (Refer to DSC-22-27-20 Reactive Windshear Detection).*

The PWS function is available, if the WXR/PWS button is set to AUTO on the CONTROLS page of the MFD, and:

- On ground:
  - If the WXR is operative
  - During takeoff.
- In flight, if the aircraft is below 1 500 ft AGL.

The ND displays the areas with predicted windshear as dashed red circles.

Note: *The VD does not display areas of windshear.*

ALERT TRIGGERING CONDITIONS

Depending on the flight phase, and on the aircraft's distance from the windshear, the PWS function will trigger:

- A warning, or
- A caution, or
- An advisory.

At landing:
- All alerts are inhibited, if the aircraft is below 50 ft
- Visual and aural warnings are downgraded to cautions from 370 ft AGL to 50 ft AGL, and range from 0.5 NM to 1.5 NM.

AUTO RANGE/MODE

The AUTO RANGE/MODE function automatically changes the ND setting to the most appropriate range and mode, in particular for specific operational situations.
In the case of W/S AHEAD or W/S AHEAD, the ND automatically changes range to 10 NM and mode to ARC. The ND displays the AUTO RANGE/MODE message.

TRIGGERING OF ALERTS

WARNING

In the case of a warning, the following are triggered:
- During takeoff, the “WINDSHEAR AHEAD, WINDSHEAR AHEAD” audio indicator
- During approach, the “GO AROUND, WINDSHEAR AHEAD” aural indicator

- The W/S AHEAD visual indicator on the PFDs
- PWS area indication on the NDs.

L2 The WX pb is also automatically selected on the EFIS CP.

L1 *Note:* *If the AUTO RANGE/MODE function is not available and:*
- *If the ND is in PLAN mode, the ND displays the W/S: CHANGE MODE message*
- *If the flight crew selects a range different from 10 NM on the EFIS CP, the ND displays the W/S: SET RNG 10 NM message*
- *If the ND is in ZOOM range, the ND displays the W/S: INCREASE RANGE message.*

CAUTION

In the case of a caution, the following are triggered:
- The “MONITOR RADAR DISPLAY” audio indicator
- The W/S AHEAD visual indicator on the PFDs
- The PWS area indication on the NDs.

L2 The WX pb is also automatically selected on the EFIS CP.

L1 *Note:* *If the AUTO RANGE/MODE function is not available and:*
- *If the ND is in PLAN mode, the ND displays the W/S: CHANGE MODE message*
- *If the flight crew selects a range different from 10 NM on the EFIS CP, the ND displays the W/S: SET RNG 10 NM message*
- *If the ND is in ZOOM range, the ND displays the W/S: INCREASE RANGE message.*

ADVISORY

In the case of an advisory, the PWS area is indicated on the NDs.

L2 The WX pb is also automatically selected on the EFIS CP

GROUND MAPPING FUNCTION

Ident.: DSC-34-SURV-30-10-00003425.0001001 / 30 APR 14
Applicable to: ALL

The ground mapping function enables the flight crew to display a map of terrain features on the ND.

The color code is:
- Black for standing water (no return)
- Green for the terrain
- Yellow or red for cities and mountains (strong returns).

L3 The WXR extracts the data from the 3D buffer, by using the ground returns and the elevation data.

L1 The flight crew can select the ground mapping function via the MODE button on the CONTROLS page of the MFD, if the WXR is on.

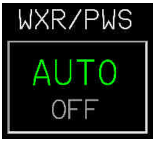
1 WXR/PWS BUTTON

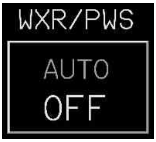
L12



The WXR/PWS automatic mode is on. The WXR and the PWS function operate automatically.
This is the default position.
On ground, associated with the WXR/PWS ON memo.
When clicked, a confirmation is necessary in order to turn off the WXR/PWS.

When the flight crew sets the WXR/PWS button to AUTO:
- The TURB button ◁ is automatically set to AUTO, and the TURB function is on
- The TURB tick box ◁ is automatically ticked, and the TURB function is on
- The HZD tick box ◁ is automatically ticked, and the weather hazard prediction function ◁ is on
- The ELEVN/TILT option list is automatically set to AUTO
- The GAIN button is automatically set to AUTO
- The MODE button is automatically set to WX.

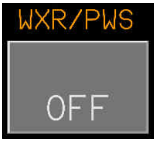
L12



The WXR/PWS is off.
When clicked, a confirmation is necessary in order to turn on the WXR/PWS.

Associated with:
- The WXR/PWS OFF memo, if the aircraft is in flight phases 2 to 11
- The WXR/PWS OFF message on the ND.

When the flight crew sets the WXR/PWS button to OFF:
- The TURB button ◁ is automatically set to OFF
- The TURB tick box ◁ is automatically unticked
- The HZD tick box ◁ is automatically unticked
- The selected option on the ELEVN/TILT option list is deselected, and the option list is inhibited
- The GAIN button no longer appears
- The MODE button no longer appears.



The WXR or the PWS function is failed.

WX DISPLAY INDICATION

WX DISPLAY 1

The WX display function is on, on SURV SYS 1(2).

 WX DISPLAY 1	The WX display function is failed on SURV SYS 1(2).
 WX DISPLAY OFF	The WX display function is off, on SURV SYS 1(2).
 WX DISPLAY OFF	The WX display function is failed, and set to OFF.

Ident.: DSC-34-SURV-30-20-40-00003455.0001001 / 30 APR 14

TURB INDICATION

 TURB 1	The TURB function is on, on SURV SYS 1(2).
 TURB 1	The TURB function is failed on SURV SYS 1(2).
 TURB OFF	The TURB function is off, on SURV SYS 1(2).
 TURB OFF	The TURB function is failed, and set to OFF.

Ident.: DSC-34-SURV-30-20-40-00003456.0001001 / 30 APR 14

PRED W/S INDICATION

 PRED W/S 1	The PWS function is on, on SURV SYS 1(2).
 PRED W/S 1	The PWS function is failed on SURV SYS 1(2).
 PRED W/S OFF	The PWS function is off, on SURV SYS 1(2).
 PRED W/S OFF	The PWS function is failed, and set to OFF.

The ND automatically displays the weather and predictive windshears if the PWS triggers an alert.

Ident.: DSC-34-SURV-30-20-20-00003457.0001001 / 03 JUL 20

3 WEATHER COLORS

The ND displays the weather precipitation in various colors, depending on the precipitation intensity (black, green, yellow or red) if:
- The WXR/PWS is set to AUTO on the MFD
- In ARC or ROSE mode
- The flight crew presses the WX pb on the EFIS CP.

The ND displays the turbulences area in magenta if:
- The WXR/PWS is set to AUTO on the MFD
- The TURB button ⊲ is set to AUTO on the MFD
- The TURB tick box ⊲ is ticked on the MFD
- In ARC or ROSE mode
- The flight crew presses the WX pb on the EFIS CP.

When in AUTO mode, the ND displays:
- The on-path weather, that the aircraft will encounter, in the conventional colors
- The off-path weather, that is not on the aircraft trajectory, in black parallel lines, with reduced intensity.

Ident.: DSC-34-SURV-30-20-20-00003458.0001001 / 30 APR 14

AZIMUTH LINE

If the flight crew selects the manual AZIM mode of the WXR, the ND displays a white line to indicate the selected azimuth value.

L2 Flashes for 5 s before the WXR automatically reverts to the automatic mode.

Ident.: DSC-34-SURV-30-20-20-00003459.0001001 / 03 JUL 20

4 WXR MESSAGES

ELEVN 12500FT	The flight crew selects the manual ELEVN mode, by: - Pulling the ELEVN knob on the SURV panel, or - Setting the ELEVN/TILT option list to ELEVN on the CONTROLS page of the MFD page. The unit is: - “ft”, if in QNH baro-setting - “FL”, if in STD baro-setting.
GAIN 53%	The flight crew selects the manual GAIN mode, by: - Pulling the GAIN knob on the SURV panel, or - Setting the GAIN button to MAN on the CONTROLS page of the MFD.
MAP	The flight crew selects the ground mapping function of the WXR, by setting the MODE button to MAP on the CONTROLS page of the MFD.
L12	
PRED W/S	The PWS function is failed. Appears when the aircraft is on ground, or when the slats/flaps lever position is not set to zero.
TILT -12.0°	The flight crew selects the manual TILT mode, by: - Pulling the ELEVN knob two times on the SURV panel, or - Setting the ELEVN/TILT option list to TILT on the CONTROLS page of the MFD page.

WX	The flight crew selects the WX display function in automatic mode, by setting: - The MODE button to WX - The TURB button ◁ to OFF - The TURB tick box ◁ to unticked - The HZD tick box ◁ to unticked - The ELEVN/TILT option list to AUTO, on the CONTROLS page of the MFD.
WX	The flight crew selects the WX display function in manual mode, by setting: - The MODE button to WX - The TURB button ◁ to OFF - The TURB tick box ◁ to unticked - The HZD tick box ◁ to unticked - The ELEVN/TILT option list to ELEVN or TILT, on the CONTROLS page of the MFD.
WX+T	The flight crew selects the WX and turbulence display function in automatic mode, by setting: - The MODE button to WX - The TURB button ◁ to AUTO - The TURB tick box ◁ to ticked - The HZD tick box ◁ to unticked - The ELEVN/TILT option list to AUTO, on the CONTROLS page of the MFD.
WX+T	The flight crew selects the WX and turbulence display function in manual mode, by setting: - The MODE button to WX - The TURB button ◁ to AUTO - The TURB tick box ◁ to ticked - The HZD tick box ◁ to unticked - The ELEVN/TILT option list to ELEVN or TILT, on the CONTROLS page of the MFD.

WX+H	The flight crew selects the WX and hazard prediction display function in automatic mode, by setting: - The MODE button to WX - The TURB button to OFF - The TURB tick box to unticked - The HZD tick box to ticked - The ELEVN/TILT option list to AUTO, on the CONTROLS page of the MFD.
WX+H	The flight crew selects the WX and hazard prediction display function in manual mode, by setting: - The MODE button to WX - The TURB button to OFF - The TURB tick box to unticked - The HZD tick box to ticked - The ELEVN/TILT option list to ELEVN or TILT, on the CONTROLS page of the MFD.
WX+T+H	The flight crew selects the WX, turbulence and hazard prediction display function in automatic mode, by setting: - The MODE button to WX - The TURB button to AUTO - The TURB tick box to ticked - The HZD tick box to ticked - The ELEVN/TILT option list to AUTO, on the CONTROLS page of the MFD.
WX+T+H	The flight crew selects the WX, turbulence and hazard prediction display function in manual mode, by setting: - The MODE button to WX - The TURB button to AUTO - The TURB tick box to ticked - The HZD tick box to ticked - The ELEVN/TILT option list to ELEVN or TILT, on the CONTROLS page of the MFD.

L12

WXR DEGRADD	The WXR is in a degraded mode, if the position of the aircraft is not sufficiently precise. Ground returns may appear in the weather display.
WXR INOP	A WXR failure is detected.
WXR OFF	The flight crew sets the WXR/PWS button to OFF on the CONTROLS page of the MFD.

WXR RNG	There is a difference in range between the SURV and the ND.
WXR TEST	The WXR is in the test mode.

Ident.: DSC-34-SURV-30-20-20-00011775.0001001 / 18 JUN 15

WXR AND RANGE/MODE MESSAGES

WEATHER AHEAD	The weather ahead function detects potential weather or turbulence hazard and the aircraft is above 1 500 ft.
AUTO RANGE/MODE	Appears in the case of W/S AHEAD or W/S AHEAD, and the ND automatically changes range to 10 NM and mode to ARC.

Ident.: DSC-34-SURV-30-20-20-00003460.0001001 / 30 APR 14

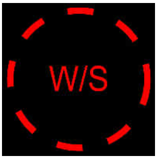
ND SETTING MESSAGES

If the AUTO RANGE/MODE function is not available, the following ND setting messages appear.

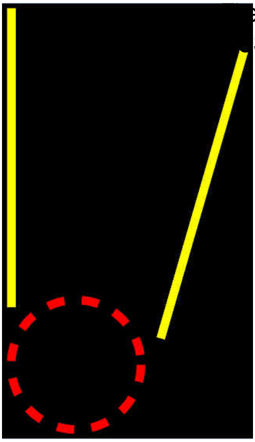
W/S: CHANGE MODE	Appears in PLAN mode, when the PWS triggers a warning.
W/S: INCREASE RANGE	Appears in ROSE mode, when: - The range selector of the ND is set to ZOOM - The PWS triggers a warning.
W/S: SET RNG 10 NM	Appears in ARC or ROSE mode, when: - The flight crew selects a range that is different from 10 NM - The PWS triggers a warning.
W/S: CHANGE MODE	Appears in PLAN mode, when the PWS triggers a caution.
W/S: INCREASE RANGE	Appears in ROSE mode, when: - The range selector of the ND is set to ZOOM - The PWS triggers a caution.
W/S: SET RNG 10 NM	Appears in ARC or ROSE mode, when: - The flight crew selects a range that is different from 10 NM - The PWS triggers a caution.
WXR GND CLUT :	The WXR does not remove the ground returns from the weather display because: - The internal radar topography database is not available, or - There is an aircraft position uncertainty of more than 2.5 NM.

Ident.: DSC-34-SURV-30-20-20-00003461.0001001 / 30 APR 14

PWS AREA INDICATION



The ND range is set to 10 NM in ARC mode, or to 20 NM in ROSE mode, and a windshear is detected.



e ND range is more than 10 NM in ARC mode, or more than 20 NM in SE mode, and a windshear is detected.

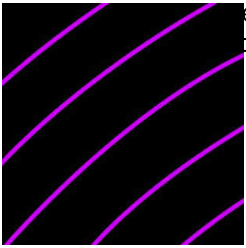
Ident.: DSC-34-SURV-30-20-20-00025318.0001001 / 06 NOV 19

WEATHER HAZARD PREDICTION INDICATIONS

Area with high probability of hail encounter.
Appears only if the flight crew activates the weather hazard prediction function (HZD tick box ticked).

Area with high probability of lightning encounter.
Appears only if the flight crew activates the weather hazard prediction function (HZD tick box ticked).

Note: *The size of predictive lightning and hail icons depends on the range selected on the ND.*



ea where the ability of the radar system to evaluate the weather is duced due to severe signal attenuation (REACT pattern).

ELEVN/TILT knob

L12

- When pushed, selects the AUTO mode.
  This is the default position.
  Associated with the WX message on the ND.
- When pulled:
  - Selects the manual ELEVN mode
  - Selects the manual TILT mode, if the previous manual mode was ELEVN.
- When turned, adjusts the elevation or tilt value.
  The ND displays the elevation or tilt value.
  The VD displays a white line indicating the elevation or tilt value.
  The default ELEVN value is the current aircraft altitude.

  The default TILT value is:
  - On ground: +3.00 °
  - In flight: 0 °.

Note: *On the CONTROLS page of the MFD, the ELEVN/TILT option list is automatically updated.*

Ident.: DSC-34-SURV-30-20-50-00003441.0001001 / 30 APR 14

Gain knob

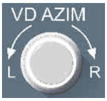
- When pushed, selects the AUTO GAIN mode
  The GAIN function is automatically set to the most appropriate setting.
- When pulled, selects the manual GAIN mode.
- When turned, adjusts the gain value in percentages.
  The ND displays the GAIN value.
  The default GAIN value is 50 %.

Note: *On the SURV/CONTROLS page of the MFD, the GAIN button is automatically updated.*

Ident.: DSC-34-SURV-30-20-50-00003442.0001001 / 30 APR 14

VD AZIM knob

L12



- When pushed, selects the AUTO mode.
  This is the default position.
- When pulled, selects the manual AZIM mode.

  On the VD:
  - The eye symbol appears, instead of the aircraft symbol
  - The terrain appears along the selected azimuth.

  The ND displays a straight white line based on the selected azimuth value.
- When turned, adjusts the AZIM value in degrees.
  The AZIM value is limited to ±60 ° around the current heading.
  The VD displays the selected AZIM value in the VIEW ALONG AZIMUTH message.
  The AZIM line moves on the ND, based on the flight crew's selection.

  Note: *The flight crew can preset the AZIM value before pulling the VD AZIM knob.*

WXR MESSAGES

WXR INOP	Appears, when the flight crew presses the WX pb on the EFIS CP, and the WXR is failed.

L12

NO TERR & WX DATA AVAIL	Appears when: - The flight crew selects the PLAN mode on the EFIS CP, or - The flight crew sets the TERR SYS button to OFF on the CONTROLS page of the MFD, or The VD does not display the weather when the TERR function is not available, because it cannot locate the weather vertically (i.e. with respect to the terrain). - The aircraft latitude is above 80 ° (North or South).
VIEW ALONG AZIM XXX°	The message is associated with the azimuth value, when the flight crew selects the manual AZIM mode.
VIEW ALONG ACFT TRK	Appears when the VD displays the weather along the aircraft track.

Ident.: DSC-34-SURV-30-20-30-00003464.0001001 / 30 APR 14

ELEVN AND TILT INDICATIONS

Indicates the selected altitude, in manual elevation mode.

Indicates the selected tilt angle, in manual tilt mode.

OVERVIEW

Ident.: DSC-34-SURV-40-10-00003466.0001001 / 30 APR 14
Applicable to: ALL

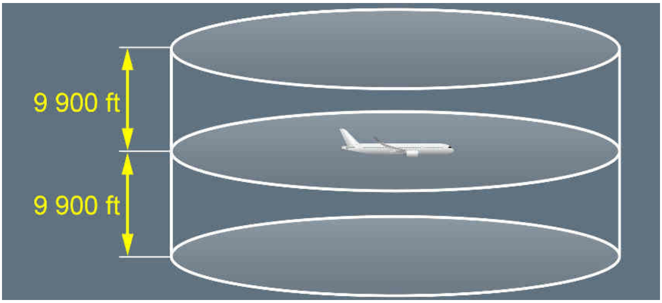
The Traffic Collision Avoidance System (TCAS):
- Detects and displays surrounding aircraft that have a transponder
- Calculates possible collision threats
- Triggers vertical speed orders, in order to avoid collisions.

PRINCIPLE

Ident.: DSC-34-SURV-40-10-00003467.0001001 / 06 MAR 18
Applicable to: ALL

The TCAS detects intruders that are flying within a maximum range of 20 NM to 60 NM (depending on the aircraft configuration and external weather conditions), and within a maximum altitude of 9 900 ft above, and 9 900 ft below, the aircraft.

TCAS Range



L2 *Note: In some circumstances, TCAS intruders may be detected up to 100 NM.*

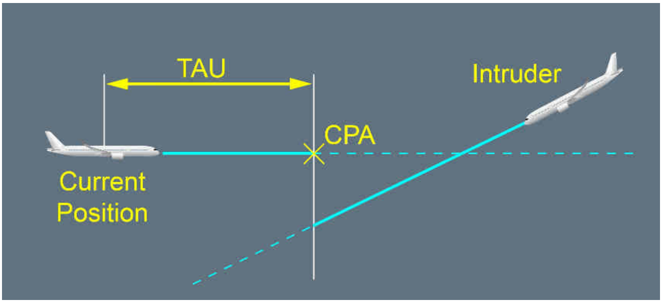
L1 The TCAS obtains data transmitted by the transponders of nearby aircraft, and uses this data to evaluate possible collision threats.

L2 The TCAS determines:
- The bearing of intruders, in relation to the bearing of the aircraft
- The distance between the aircraft and intruders, and the rate of separation or closure
- The relative altitude of intruders, if intruders report their altitude via a Mode-C or Mode-S transponder.

The TCAS then calculates the intruder trajectory, the Closest Point of Approach (CPA), and the estimated time (TAU), before reaching the CPA.

L3 The TAU is the ratio between the distance that separates both aircraft, and the sum of their speed.

TAU Definition



L1 If the TCAS detects that the trajectory of an intruder may be a collision threat, it triggers:
- Audio and visual indicators
- Vertical speed orders, to ensure there is sufficient distance between the trajectory of the aircraft and the trajectory of the intruders. In addition, the TCAS takes all intruders into account, and adjusts the vertical speed orders, in order to avoid a collision.

L2 If the aircraft is below 1 650 ft AGL in descent, or above 1 750 ft AGL in climb, the TCAS does not consider aircraft that are descending below 380 ft or below 400 ft while climbing. These aircraft are considered to be on ground.

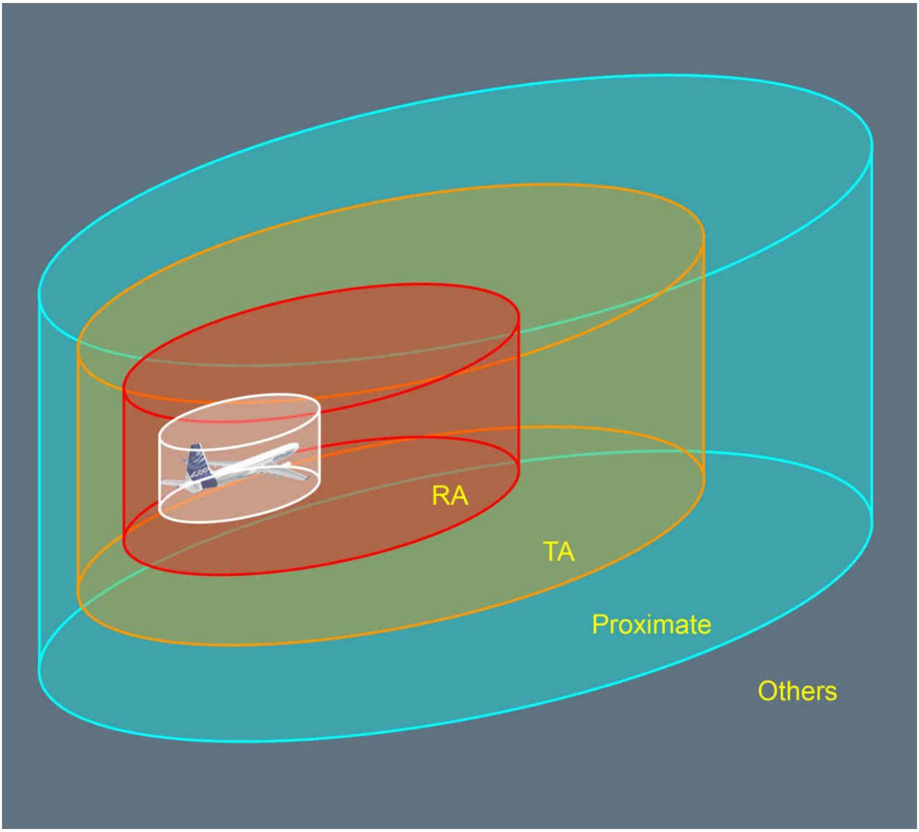
INTRUDER DETECTION CATEGORIES

Applicable to: ALL

Ident.: DSC-34-SURV-40-10-10-00003468.0001001 / 30 APR 14

The TCAS divides the space surrounding the aircraft into the following four zones, in order to evaluate and categorize possible collision threats:
- Resolution Advisory (RA)
- Traffic Advisory (TA)
- Proximate intruders
- Other intruders.

TCAS Envelopes



Ident.: DSC-34-SURV-40-10-10-00003471.0001001 / 03 NOV 16

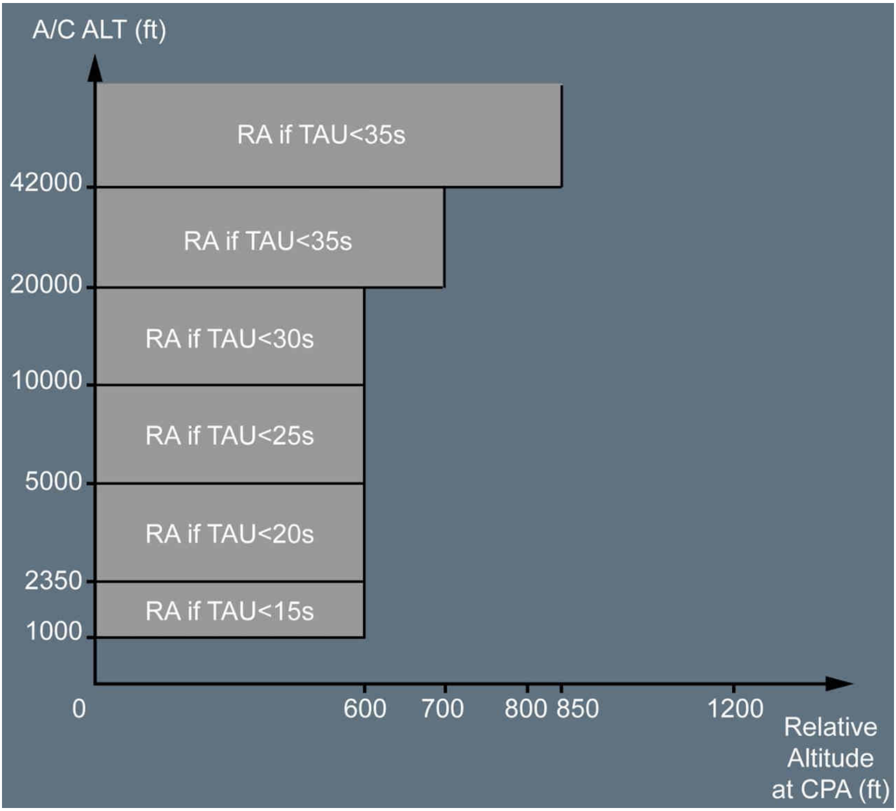
RESOLUTION ADVISORY (RA)

The TCAS triggers a Resolution Advisory (RA) to indicate that there is a high threat of collision.

There are two types of RAs:
- Preventive RA: The flight crew must monitor vertical speed
- Corrective RA: The flight crew must adjust vertical speed.

The PFD displays vertical speed orders that indicate the vertical direction that the aircraft should take, in order to avoid a collision.

RA Intruder



L2 For more information about RA inhibitions, *Refer to DSC-34-SURV-40-10 Advisory Inhibition*.

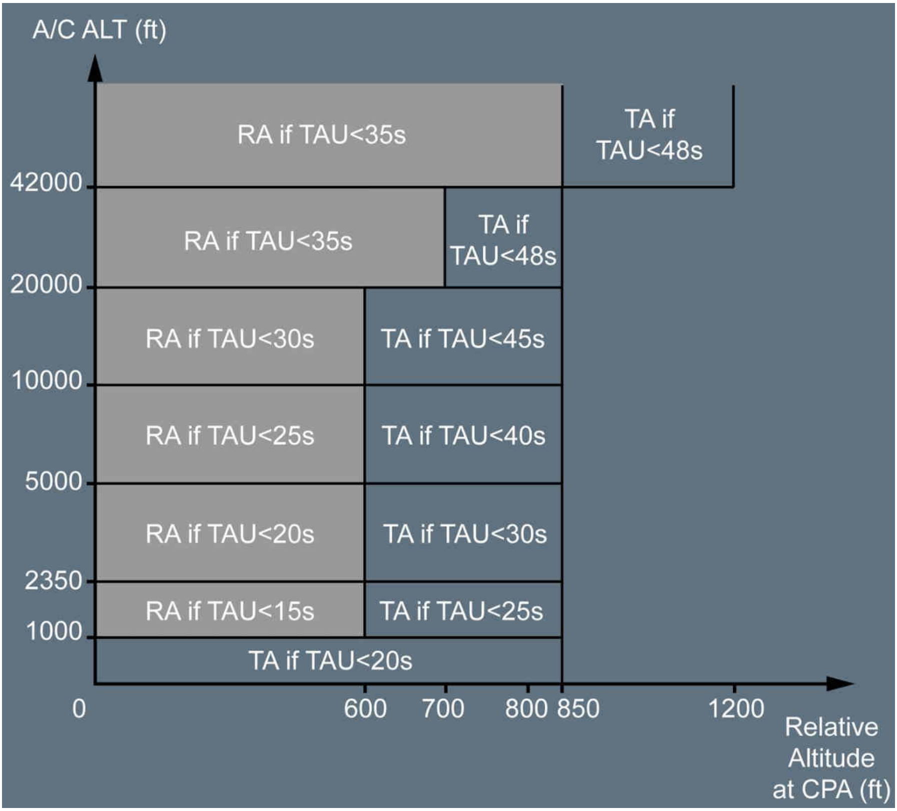
L1 The TCAS associates audio indicators with the RAs.

Ident.: DSC-34-SURV-40-10-10-00003472.0001001 / 03 NOV 16

TRAFFIC ADVISORY (TA)

The TCAS triggers a Traffic Advisory (TA) to indicate a possible collision threat. This advisory helps the flight crew to visually locate the intruder. It also prepares the flight crew for a possible RA. However, a TA may not always occur before an RA.

RA/TA Intruder



L2 For more information about TA inhibitions, *Refer to DSC-34-SURV-40-10 Advisory Inhibition*.

L1 The TCAS associates audio indicators with the TAs.

Ident.: DSC-34-SURV-40-10-10-00003473.0001001 / 30 APR 14

PROXIMATE INTRUDER

The TCAS monitors intruders that are in proximity of the aircraft, but that are not a collision threat. These are called proximate intruders.

L2 The difference in altitude between the aircraft and the proximate intruder is less than 1 200 ft, and they are within 6 NM of each other.

Relative Altitude at CPA (ft)

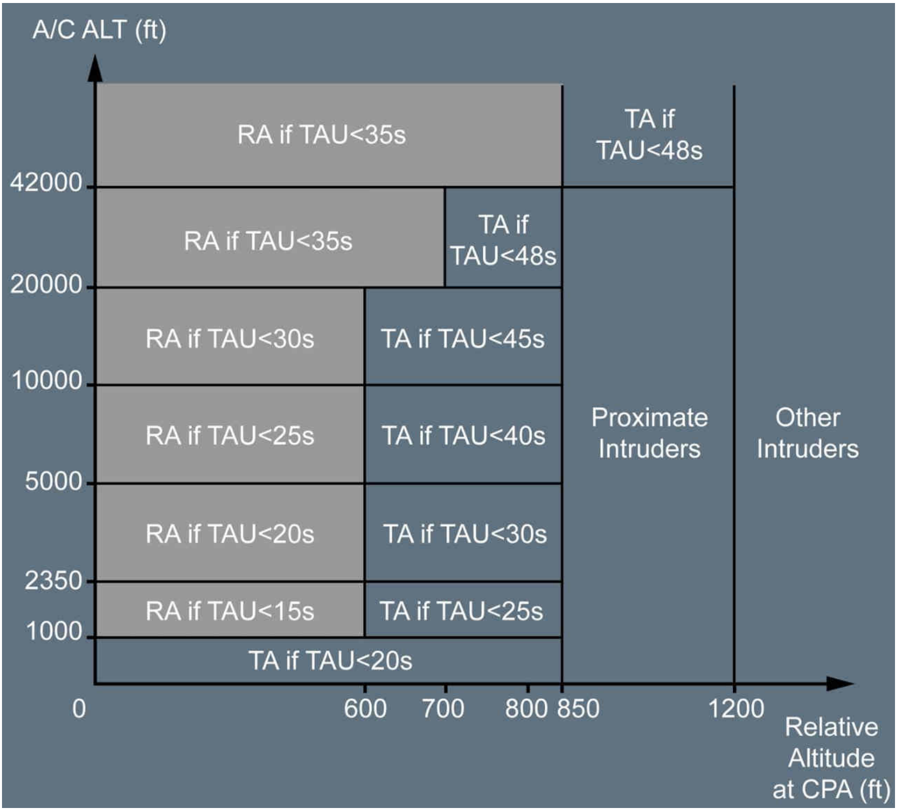
Ident.: DSC-34-SURV-40-10-10-00003474.0001001 / 30 APR 14

OTHER INTRUDERS

The TCAS monitors intruders that are in the detection envelope of the TCAS, but are not in the proximate intruder, TA, or RA category.
These are called other intruders.

L2 The difference in altitude between the aircraft and the other intruder is between 1 200 ft and 9 900 ft above or below.

Other Intruders



Ident.: DSC-34-SURV-40-10-10-00023868.0001001 / 03 NOV 16

L2 ADVISORY INHIBITION

Some advisories are inhibited depending on the following aircraft altitudes:

- All intruders that fly below 380 ft AGL when the aircraft altitude is below 1 700 ft AGL
- All RAs below 1 100 ft AGL in climb and 900 ft AGL in descent. In this case, the RAs are changed to TAs
- "Descend" type RAs below 1 200 ft AGL in climb and 1 000 ft AGL in descent

L3 *Note: When the aircraft receives a "Descend" type RA and goes below 1 000 ft AGL in descent, the vertical speed target is automatically changed to 0 ft/min.*

L2
- "Increase Descent" RA below 1 650 ft AGL in climb and 1 450 ft AGL in descent
- All TA aural messages below 600 ft AGL in climb and 400 ft AGL in descent.

Ident.: DSC-34-SURV-40-10-10-00024671.0001001 / 06 MAR 18

TCAS INTRUDER WITH NO REPORTED ALTITUDE

For intruders that do not report their altitude:
- The relative altitude does not appear on ND
- The TCAS never triggers an RA
- The TCAS inhibits the TA when own aircraft altitude is above 15 500 ft.

Intruder with No Reported Altitude

TCAS MODES

Applicable to: ALL

Ident.: DSC-34-SURV-40-10-20-00003469.0001001 / 30 APR 14

The TCAS has three different modes of operation:
- The Traffic Advisory/Resolution Advisory (TA/RA) mode
- The Traffic Advisory Only (TA ONLY) mode
- The standby (STBY) mode.

Ident.: DSC-34-SURV-40-10-20-00003475.0001001 / 30 APR 14

TRAFFIC ADVISORY/RESOLUTION ADVISORY (TA/RA) MODE

The Traffic Advisory/Resolution Advisory (TA/RA) mode is the default TCAS mode.

The TA/RA mode enables:
- The ND to display all intruders
- The PFD to display the vertical speed scale
- The triggering of audio indicators.

Ident.: DSC-34-SURV-40-10-20-00003476.0001001 / 06 NOV 14

TRAFFIC ADVISORY ONLY (TA ONLY) MODE

If the TCAS is in TA ONLY mode:
- All RAs are inhibited, and become TAs
- The PFD does not display vertical speed areas
- The ND displays the TA ONLY message
- L3 The TAU depends on the aircraft altitude, the minimum TAU is 20 s at 1 000 ft.

L1 TA ONLY mode can be selected manually, or automatically.

MANUAL SELECTION

In order to manually select the TA ONLY mode, the flight crew can:
- Press the TA pb on the SURV panel, or
- Select the TA ONLY option on the SURV CONTROLS page of the MFD.

AUTOMATIC SELECTION

The TA ONLY mode is automatically selected, if:
- One of the following alerts is triggered, and/or
  - Windshear
  - Stall
  - TAWS.

  L2 The TCAS returns to TA/RA mode, when the alert is finished.
- L1 The aircraft is below 1 000 ft±100 ft.

Ident.: DSC-34-SURV-40-10-20-00003477.0001001 / 05 MAY 14

STANDBY (STBY) MODE

In the standby mode, the TCAS does not perform any TCAS function, and does not trigger any alert.
The PFD and the ND do not display any TCAS information.

On ground, the STBY mode is associated with:
- The TCAS STBY message on the ND
- The TCAS STBY memo.

In flight, the STBY mode is associated with:
- The TCAS STBY message on the ND
- The SURV TCAS STBY ECAM Alert.

TCAS DISPLAY SELECTION

Applicable to: ALL

Ident.: DSC-34-SURV-40-10-30-00003470.0001001 / 30 APR 14

The ND displays intruders that enter the zone surrounding the aircraft, when:
- In ROSE or ARC mode
- • The flight crew presses the TRAF pb on the EFIS CP, or
  • The flight crew did not press the TRAF pb on the EFIS CP, and the TCAS triggers an alert.

Note: If the ND is in PLAN mode, the ND does not display intruders.

When the aircraft is below 1 700 ft AGL, all advisories indicating intruders below 380 ft AGL are inhibited.

L2 The TCAS manages up to 60 intruders, but the ND displays the 8 most threatening intruders only.

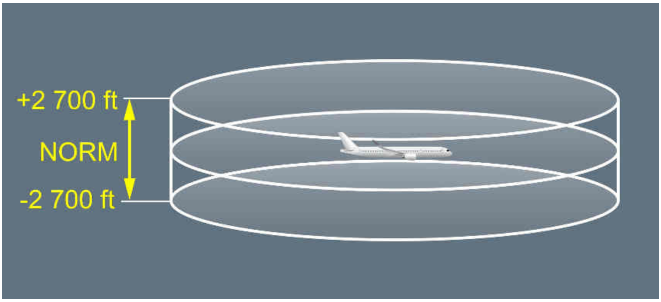
L1 There are three types of TCAS displays:
- Normal (NORM)
- Above (ABV)
- Below (BLW).

Ident.: DSC-34-SURV-40-10-30-00003478.0001001 / 30 APR 14

NORMAL

NORM is the default selection.
In NORM, the TCAS displays intruders that are between 2 700 ft below, and 2 700 ft, above the aircraft.

Normal Mode



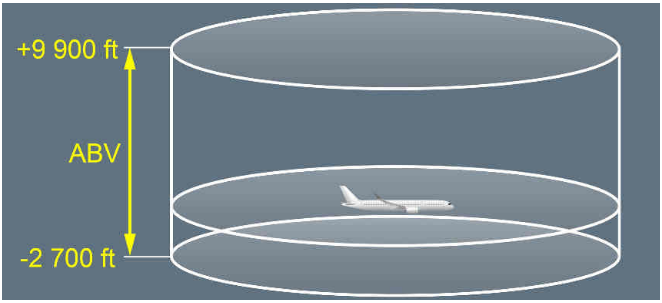
In order to select the NORM TCAS display, the flight crew can:
- Deselect the ABV pb and the BLW pb on the SURV panel, or
- Select the NORM option on the SURV/CONTROLS page of the MFD.

Ident.: DSC-34-SURV-40-10-30-00003479.0001001 / 30 APR 14

ABOVE (ABV)

In ABV mode, the TCAS displays intruders that are between 2 700 ft below, and 9 900 ft above, the aircraft.

Above Mode



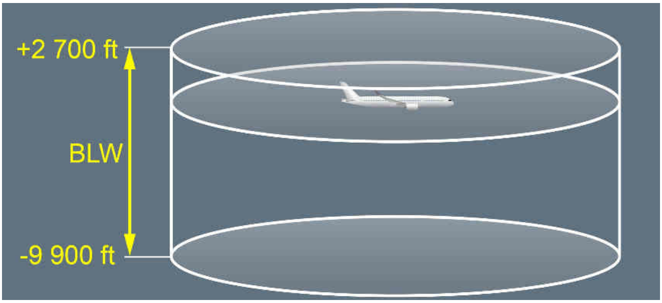
In order to select the ABV TCAS display, the flight crew can:
- Press the ABV pb on the SURV panel, or
- Select the ABV option on the SURV/CONTROLS page of the MFD.

Ident.: DSC-34-SURV-40-10-30-00003480.0001001 / 30 APR 14

BELOW (BLW)

In BLW mode, the TCAS displays intruders that are between 9 900 ft below, and 2 700 ft above, the aircraft.

Below Mode



In order to select the BLW TCAS display, the flight crew can:

- Press the BLW pb on the SURV panel, or
- Select the BLW option on the SURV/CONTROLS page of the MFD.

Ident.: DSC-34-SURV-40-10-30-00021398.0001001 / 02 APR 15

AUTO RANGE/MODE

The AUTO RANGE/MODE function automatically changes the ND setting to the most appropriate range and mode, in particular for specific operational situations.
In the case of TA or RA alert, the ND automatically changes range to 20 NM and mode to ROSE-NAV. The ND displays the AUTO RANGE/MODE message.

COCKPIT VIEW

L12

Audio Indicator	Condition or Cause	Duration
Traffic, Traffic (Synthetic voice)	The TCAS triggers a TA. For more information on the procedure, *Refer to PRO-ABN-SURV [MEM] TCAS CAUTION - TRAFFIC ADVISORY*.	Sounds one time.
Climb, climb (Synthetic voice)	The TCAS triggers a corrective RA. The aircraft must climb with the vertical speed that is indicated by the green area on the vertical speed scale of the PFD. For more information on the procedure, *Refer to PRO-ABN-SURV [MEM] TCAS WARNING - RESOLUTION ADVISORY*.	Sounds one time.
Climb crossing climb, climb crossing climb (Synthetic voice)	The TCAS triggers a corrective RA, and the aircraft will cross the intruder's altitude. The aircraft must climb with the vertical speed that is indicated by the green area on the vertical speed scale of the PFD. For more information on the procedure, *Refer to PRO-ABN-SURV [MEM] TCAS WARNING - RESOLUTION ADVISORY*.	Sounds one time.
Increase climb, increase climb (Synthetic voice)	The TCAS triggers a corrective RA, and has already triggered a CLIMB alert. The vertical speed is not sufficient to achieve safe vertical separation. For more information on the procedure, *Refer to PRO-ABN-SURV [MEM] TCAS WARNING - RESOLUTION ADVISORY*.	Sounds one time.

Continued on the following page

Continued from the previous page

Audio Indicator	Condition or Cause	Duration
Climb climb now, Climb climb now (Synthetic voice)	The TCAS triggers a corrective RA, and has already triggered a DESCEND alert. The intruder's trajectory has changed. For more information on the procedure, *Refer to PRO-ABN-SURV [MEM] TCAS WARNING - RESOLUTION ADVISORY*.	Sounds one time.
Descend, descend (synthetic voice)	The TCAS triggers a corrective RA. The aircraft must descend with the vertical speed that is indicated by the green area on vertical speed scale of the PFD. For more information on the procedure, *Refer to PRO-ABN-SURV [MEM] TCAS WARNING - RESOLUTION ADVISORY*.	Sounds one time.
Descend crossing descend, descend crossing descend (Synthetic voice)	The TCAS triggers a corrective RA, and the aircraft will cross the intruder's altitude. The aircraft must descend with the vertical speed that is indicated by the green area on vertical speed scale of the PFD. For more information on the procedure, *Refer to PRO-ABN-SURV [MEM] TCAS WARNING - RESOLUTION ADVISORY*.	Sounds one time.
Increase descent, increase descent (Synthetic voice)	The TCAS triggers a corrective RA, and has already triggered a DESCEND alert. The vertical speed is not sufficient to achieve safe vertical separation. For more information on the procedure, *Refer to PRO-ABN-SURV [MEM] TCAS WARNING - RESOLUTION ADVISORY*.	Sounds one time.
Descend descend now, descend descend now (Synthetic voice)	The TCAS triggers a corrective RA, and has already triggered a CLIMB alert. The intruder's trajectory has changed. For more information on the procedure, *Refer to PRO-ABN-SURV [MEM] TCAS WARNING - RESOLUTION ADVISORY*.	Sounds one time.

Continued on the following page

Continued from the previous page

Audio Indicator	Condition or Cause	Duration
Level off, Level off (Synthetic voice)	The TCAS triggers a corrective RA. The flight crew must reduce the vertical speed that is indicated by the green area on vertical speed scale of the PFD. For more information on the procedure, *Refer to PRO-ABN-SURV [MEM] TCAS WARNING - RESOLUTION ADVISORY*.	Sounds one time.
Monitor vertical speed (Synthetic voice)	The TCAS triggers a preventive RA. The flight crew must ensure that vertical speed remains outside the red area on the vertical speed scale of the PFD. For more information on the procedure, *Refer to PRO-ABN-SURV [MEM] TCAS WARNING - RESOLUTION ADVISORY*.	Sounds one time.
Maintain vertical speed maintain (Synthetic voice)	The TCAS triggers a corrective RA. The flight crew must maintain the vertical speed that is indicated in the green area on the vertical speed scale of the PFD. For more information on the procedure, *Refer to PRO-ABN-SURV [MEM] TCAS WARNING - RESOLUTION ADVISORY*	Sounds one time.
Maintain vertical speed, crossing maintain (Synthetic voice)	The TCAS triggers a corrective RA, and the aircraft will cross the intruder's altitude. The flight crew must maintain the vertical speed that is indicated in the green area on the vertical speed scale of the PFD. For more information on the procedure, *Refer to PRO-ABN-SURV [MEM] TCAS WARNING - RESOLUTION ADVISORY*.	Sounds one time.
Clear of conflict (Synthetic voice)	The range increases, and separation is sufficient.	Sounds one time.

INTRUDERS

The following symbols indicate the range and location of intruders:

🟥	An intruder is in the RA range.
🟠	An intruder is in the TA range.
◆	An intruder is in the proximate range.
◇	Other intruder.

These symbols appear with:
- Two digits, that indicate the relative altitude of the intruder (in hundreds of feet)
  They appear below the symbol, if the intruder is below the aircraft, and above the symbol if the intruder is above the aircraft.
- A plus (+) or minus (-) symbol that appears to the left of the digits, and that indicates if the intruder is above (+) or below (-) the aircraft
- An arrow, to the right of the digits, that indicates the vertical movement of the intruder. No arrow appears if the traffic vertical speed is less than 500 ft/min.

When an intruder does not report their altitude, the relative altitude and vertical movement indicators do not appear.

Ident.: DSC-34-SURV-40-20-40-00003499.0001001 / 03 JUL 14

TCAS MESSAGES

22.1 NM +12↑	Provides information (range, relative altitude, and vertical speed arrow) about the two most dangerous RA intruders without bearing.
22.1 NM +12↑	Provides information (range, relative altitude, and vertical speed arrow) about the two most dangerous TA intruders without bearing.
TA ONLY	Automatic selection of the TA ONLY mode or the flight crew selects the TA ONLY mode, by: - Pressing the TA pb on the SURV panel, or - Setting the TCAS mode option list to TA ONLY on the SURV CONTROLS page of the MFD.
TCAS	The TCAS is failed, and the TRAF pb is pressed on the EFIS CP.
TCAS STBY	On ground, the TRAF pb is pressed on the EFIS CP, and: - The TCAS is on standby, or - The XPDR is on standby, or - The XPDR is failed.
TCAS STBY	In flight, the TRAF pb is pressed on the EFIS CP, and: - The TCAS is on standby, or - The XPDR is on standby, or - The XPDR is failed.
TCAS TEST	The TCAS is in test, and the TRAF pb is pressed on the EFIS CP

Ident.: DSC-34-SURV-40-20-40-00022684.0001001 / 02 APR 15

AUTO RANGE/MODE MESSAGE

AUTO RANGE/MODE	Appears in the case of TA or RA alert, and the ND automatically changes range to 20 NM and mode to ROSE-NAV.

Ident.: DSC-34-SURV-40-20-40-00003500.0001001 / 02 APR 15

ND SETTING MESSAGES

If the AUTO RANGE/MODE function is not available, the following ND setting messages appear.

TCAS: INCREASE RANGE	Appears in ROSE-VOR or ROSE-LS mode, when: - The flight crew sets the range selector to ZOOM - The aircraft is not on ground - The TCAS identifies at least one TA intruder.
TCAS: INCREASE RANGE	Appears in ROSE-VOR or ROSE-LS mode, when: - The flight crew sets the range selector to ZOOM - The aircraft is not on ground - The TCAS identifies at least one RA intruder.
TCAS: REDUCE RANGE	Appears, when: - The flight crew selects a range on the EFIS CP that is more than 40 NM - The TCAS identifies at least one TA intruder.
TCAS: REDUCE RANGE	Appears, when: - The flight crew selects a range on the EFIS CP that is more than 40 NM - The TCAS identifies at least one RA intruder.
TCAS: CHANGE MODE	Appears in PLAN mode, when the TCAS identifies at least one TA intruder.
TCAS: CHANGE MODE	Appears in PLAN mode, when the TCAS identifies at least one RA intruder.

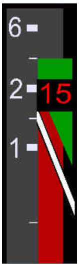
VERTICAL SPEED SCALE



When the TCAS triggers an RA, green and red areas appear instead of the grey background:

- A red area indicates the vertical speed range that is not authorized
- A green area indicates the vertical speed range within which the aircraft should fly, in order to avoid a threat of collision with one or more intruders.

Note: *The aircraft can also fly in the grey vertical speed range area without a threat of collision.*

L3 BACKUP ALTITUDE

In the case of the backup altitude is automatically selected, the TCAS is failed.
For more information on the backup automatic selection,*Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications*.
In the case of the backup altitude is manually selected on one side, the TCAS alert indications (red and green areas) are not displayed on the vertical speed scale. These information remain available on the opposite side.
For more information on the backup manual selection, *Refer to DSC-34-NAV-20-20 AIR DATA Selector*.

OVERVIEW

Ident.: DSC-34-SURV-50-10-00003503.0001001 / 30 APR 14
Applicable to: ALL

The transponder (XPDR) responds to Air Traffic Control (ATC) requests, and helps the ground controller to identify and locate each aircraft, and monitor air traffic.
The XPDR supports the TCAS surveillance function, and uses the TCAS/MODE S antennas.
The MFDs display the XPDR status.

Both SURV SYS 1 and SYS 2 interface with the RMPs, in order to:
- Control the transponder code
- Activate the identification function
- Synchronize data displayed on the MFDs.

PRINCIPLE

Ident.: DSC-34-SURV-50-10-00003504.0001001 / 30 APR 14
Applicable to: ALL

The XPDR automatically responds to requests:
- From the ATC, to ensure effective air traffic surveillance
- From another aircraft that has a TCAS, to ensure that traffic alerts are triggered.

The XPDR provides the ATC with:
- Mode A: Transmission of aircraft identification
- Mode C: Transmission of aircraft barometric altitude
- Mode S ELS / EHS: Selective calling
- Mode ADS-B: Data broadcast.

The XPDR receives information from:
- Aircraft that have a TCAS
- Mode S ground stations.

L2 ADIRUs provide the necessary parameters to each XPDR function on both SURV SYS.

The XPDR transmits the following parameters to the ATC center, upon ground request:
- The indicated airspeed, Mach number, and baro vertical speed, that are supplied by the ADRs
- The magnetic heading, ground speed, track angle, track angle rate, and inertial vertical speed, that are all supplied by the IRs
- The selected altitude and barometric reference settings supplied by the FCUs.

ATC
Request
ATC Control

XPDR MODES

Ident.: DSC-34-SURV-50-10-00003505.0001001 / 30 APR 14
Applicable to: ALL

The XPDR has three different modes of operation:

- AUTO
  - In flight, mode S continuously transmits information to other aircraft and replies to requests from aircraft and ground stations
  - On ground, modes A and C are inhibited. Mode S (selective calling) and mode ADS-B (data broadcast) are operative.
- STBY.
  The XPDR does not transmit either reply to ground stations and other aircraft. The TCAS is also in the standby mode.

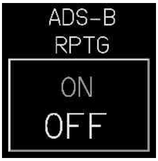
The flight crew activates the broadcast of data.

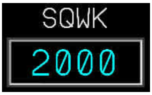
L12



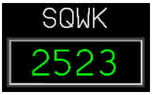
The flight crew deactivates the broadcast of data.
Associated with the ADS-B RPTG OFF memo.

Ident.: DSC-34-SURV-50-20-20-00000548.0001001 / 02 APR 15

SQWK ENTRY FIELD

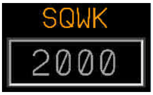


The XPDR is on.
The flight crew can enter the XPDR code in the entry field.



The XPDR is on.
The flight crew modifies the XPDR code in the entry field. It automatically updates the SQWK value on the RMP.

L12

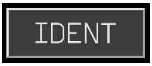


The XPDR is failed.

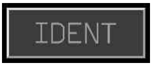
Associated with one of the following ECAM alerts:
- SURV XPDR 1+2 FAULT (*Refer to procedure*)
- SURV SYS 1+2 FAULT (*Refer to procedure*).

Ident.: DSC-34-SURV-50-20-20-00000549.0001001 / 30 APR 14

IDENT BUTTON



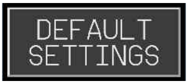
When clicked, the aircraft identification signal is sent.



The XPDR is failed.

Ident.: DSC-34-SURV-50-20-20-00000550.0001001 / 03 JUL 20

4 DEFAULT SETTINGS BUTTON



When clicked, automatically sets all the XPDR settings to their default position on both MFDs. A confirmation is necessary in order to set the default positions:

- The MODE button is set to AUTO
- The ALT RPTG button is set to ON
- The ADS-B RPTG button is set to ON.

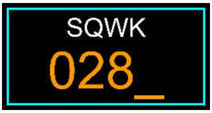
XPDR MODE INDICATION

AUTO	The flight crew selects the AUTO mode.
STBY	The flight crew selects the STBY mode.

SQWK CODE

SQWK 0163	The flight crew enters a SQWK code.



The flight crew enters an erroneous digit in the SQWK code.
Associated with the SQUAWK CODE NOT VALID message in the RMP messages area.

If the flight crew attempts to manually validate the erroneous SQWK code:
- The previous valid code appears, instead of the erroneous SQWK code
- The RMP messages area displays the SQUAWK CODE REVERTED TO PREV ENTRY message.

IDENT INDICATION

The associated ADK 3 key enables the flight crew to send the aircraft identification signal.
This is the default position.

The star symbol disappears for 5 s, after the flight crew presses the ADK 3 key, in order to send the aircraft identification signal.

RMP MESSAGES

SQUAWK CODE NOT VALID	The flight crew enters an erroneous SQWK code.
SQUAWK CODE REVERTED TO PREV ENTRY	The flight crew attempts to manually validate an erroneous or incomplete SQWK code.
TRANSMITTING IDENT	The aircraft identification signal has been transmitted.

Intentionally left blank

OVERVIEW

Ident.: DSC-34-SURV-60-10-00016476.0001001 / 06 AUG 14
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP

The Automatic Dependent Surveillance - Broadcast (ADS-B) Traffic provides the flight crew with better situation awareness, via the display of information about the airborne traffic.
The ADS-B Traffic is complementary to the TCAS.
L2 For more information about TCAS, *Refer to DSC-34-SURV-40-10 Overview*.

PRINCIPLE

Ident.: DSC-34-SURV-60-10-00016477.0001001 / 08 JUL 19
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP

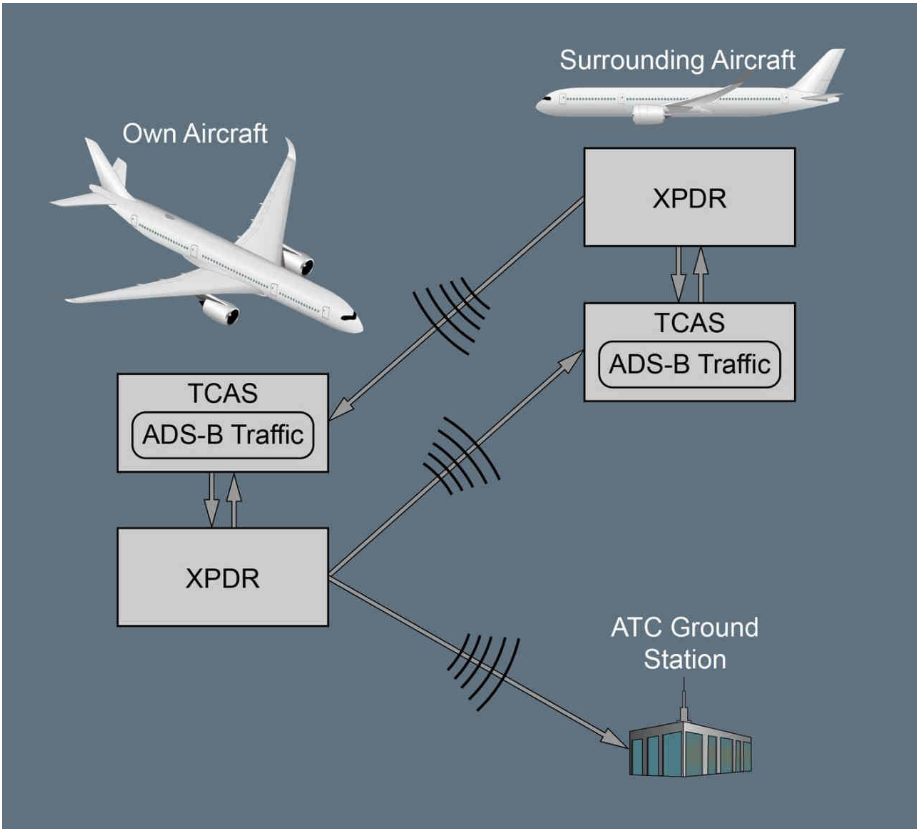
The ADS-B Traffic depends on the TCAS.

The ADS-B Traffic is a tool that assists the flight crew in:
- The visual acquisition of the surrounding aircraft equipped with ADS-B
- The visual separation during Visual Separation Approach (VSA)
- The preparation of a level change with reduced longitudinal separation, referred to as the In-Trail Procedures (ITP).

CAUTION	The flight crew must always confirm the ADS-B Traffic information by visual contact (out of the window) or with ATC. The flight crew must not use the ADS-B Traffic to maneuver or to avoid collision and must always follow the TCAS orders.

The ADS-B Traffic uses information about the surrounding airborne traffic that broadcasts ADS-B data.
L2 For more information on the ADS, *Refer to DSC-46-ATC-10-10 Overview*.
L3 Each aircraft equipped with the ADS-B, automatically and continuously transmits traffic surveillance data to the Air Traffic Control (ATC) ground stations and to other aircraft. The TCAS receives and processes this traffic surveillance data.
The ADIRS computes the relative position of the surrounding traffic, via the GPIRS position.

ADS-B Traffic Principle



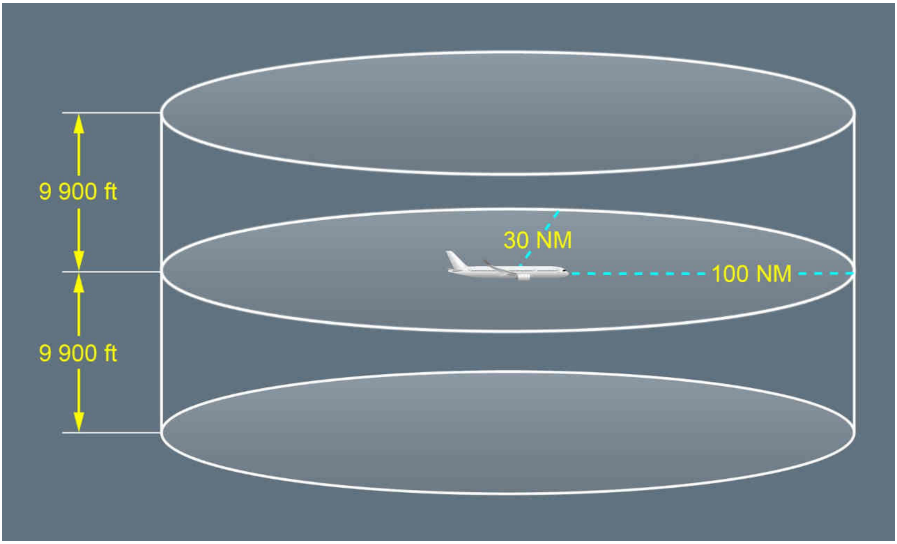
Surrounding Aircraft
Own Aircraft
XPDR
TCAS
ADS-B Traffic
TCAS
ADS-B Traffic
XPDR
ATC Ground Station

L2 The ADS-B Traffic function can:
- Receive ADS-B information from up to 400 aircraft equipped with ADS-B
- Display the traffic information from up to 90 aircraft equipped with the ADS-B on the MFD
- Display up to 8 aircraft equipped with ADS-B on the ND.

L1 RANGE

The ADS-B Traffic detects the aircraft that are in an area defined by the following limits:
- 30 NM on each side of the aircraft
- Up to 100 NM in front of and behind the aircraft, depending on weather conditions
- 9 900 ft above and below the aircraft.

Range Detection of ADS-B Traffic



CONTROLS

The flight crew can interact with the ADS-B Traffic via:
- The ND
- The MFD
- The EFIS CP
- The KCCU.

ADS-B TRAFFIC SYSTEM

The ADS-B Traffic has two redundant systems: ADS-B Traffic 1 and the ADS-B Traffic 2.
The SURV SYS 1(2) hosts the ADS-B Traffic 1(2).

Note: *The ADS-B Traffic 1(2) depends on the TCAS SYS 1(2). In the case of the flight crew sets the ADS-B Traffic to ON, when TCAS SYS 1 is activated, the ADS-B Traffic 1 is activated. When TCAS SYS 2 is activated, the ADS-B Traffic 2 is activated.*

L2 The ADS-B Traffic uses information from the following systems:
- TCAS
- ADIRS
- FMS
- Others.

ADS-B TRAFFIC FUNCTION

Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP

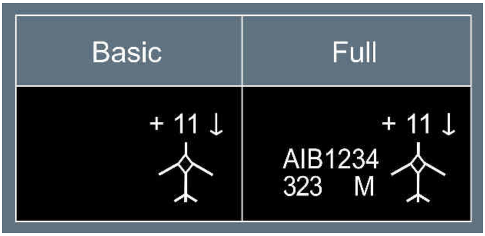
Ident.: DSC-34-SURV-60-10-10-00016478.0001001 / 06 AUG 14

ADS-B TRAFFIC FUNCTION

TRAFFIC DISPLAY ON ND

The ADS-B Traffic can display the surrounding traffic on the ND.

There are two different labels with different level of information about each traffic:
- The basic label displays:
  - The traffic symbol
  - The relative altitude in hundreds of feet
  - The altitude variation.
- The full label displays:
  - The traffic symbol
  - The relative altitude in hundreds of feet
  - The altitude variation
  - The flight identification
  - The ground speed
  - The wake vortex category (L, M or H).



L2 For more information on the traffic symbol and label, *Refer to DSC-34-SURV-60-20 Traffic Information*.

L1 The flight crew can display the surrounding traffic and change the level of information in the label via the TRAF pb on the EFIS CP (*Refer to DSC-34-SURV-60-20 EFIS CP*).

When the flight crew moves the KCCU cursor over one of the traffic symbols:
- A blue square appears around the traffic symbol
- The full label is displayed next to the traffic symbol.

The flight crew can select a traffic on the ND via the KCCU cursor.

Note: When a traffic comes within the range of the TCAS, the traffic symbol changes accordingly. If the ADS-B Traffic is not available or TCAS information does not agree with the ADS-B Traffic information, the basic TCAS symbol is displayed.

TRAFFIC DISPLAY ON MFD

The SURV TRAFFIC page displays a list of the surrounding aircraft.
The flight crew can select a traffic in the list via the KCCU cursor. When the flight crew selects a traffic, the SURV TRAFFIC page displays the traffic information window.

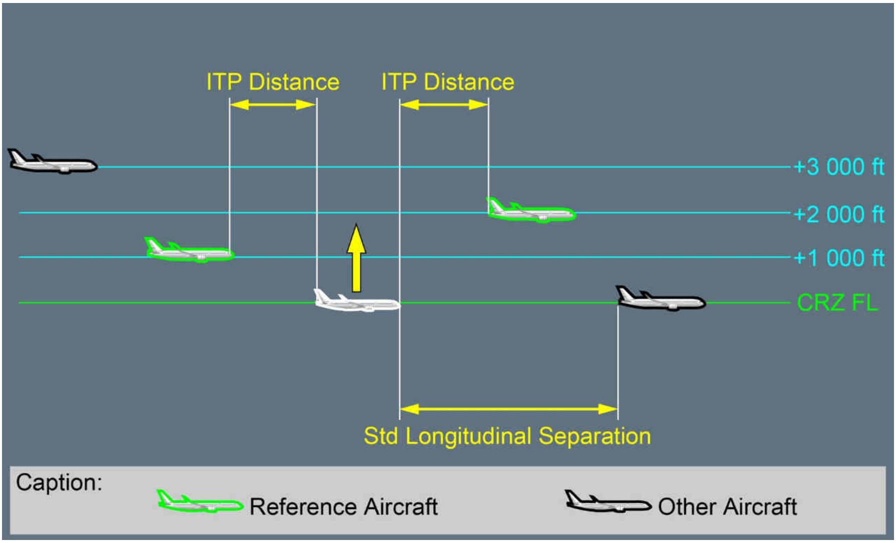
The traffic information window displays the following information about the selected traffic:
- The true or magnetic heading, depending on the position of the TRUE/MAG pb
- The true track of the traffic
- The true heading of the traffic, if the TRK value is not available
- The wake vortex category of the traffic
- The distance between the aircraft and the traffic
- The ground speed of the traffic
- The indicated airspeed of the traffic, if the GS is not available
- The relative altitude of the traffic
- The flight level of the traffic
- The vertical speed of the traffic.

The flight crew can use the list to prepare an In-Trail Procedure (ITP).

Ident.: DSC-34-SURV-60-10-10-00016479.0001001 / 02 APR 15

IN-TRAIL PROCEDURE (ITP)

The In-Trail Procedure (ITP) assists the flight crew in the preparation of a flight level change with reduced longitudinal separation.
At the end of the preparation, the ITP function prepares a text message that the flight crew can transfer to the mailbox and send to the ATC.



ITP Distance
ITP Distance
+3 000 ft
+2 000 ft
+1 000 ft
CRZ FL
Std Longitudinal Separation
Caption:
Reference Aircraft
Other Aircraft

The ITP is mainly used in oceanic areas or areas that do not have radar coverage.

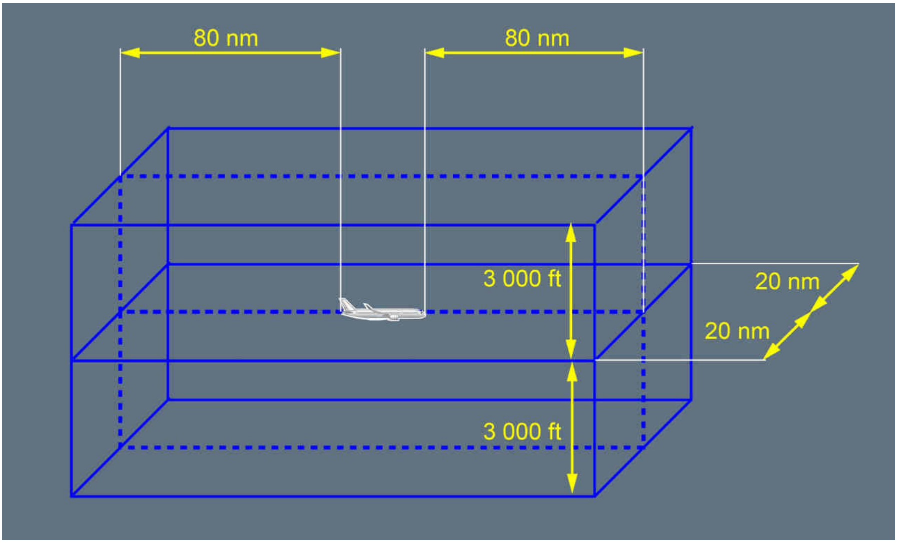
The ITP traffic list displays all the traffic that:

- Have the same track as this aircraft

L2 Traffic is considered to have the same track when its relative track is less than 45 °.

L1
- Are equipped with ADS-B
- Are in the area illustrated below.

The minimum ITP altitude change is 1 000 ft, the maximum ITP altitude change is 3 000 ft, and the maximum ITP longitudinal separation is 80 NM.



80 nm

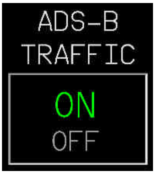
TRAFFIC Page

ADS-B TRAFFIC Button

DEFAULT SETTINGS Button

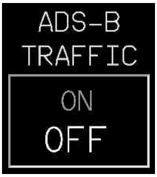
Ident.: DSC-34-SURV-60-20-20-00016486.0001001 / 06 AUG 14

ADS-B TRAFFIC BUTTON



The ADS-B Traffic function is available.
The traffic data appears on both NDs.

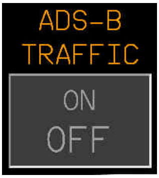
L12



- The ADS-B Traffic function is not available, or
- In flight, the XPDR is in standby.

The traffic data does not appear on any ND, and both TRAFFIC panels of the SURV pages are not available.
Associated with the ADS-B TRAFFIC OFF memo.

L12

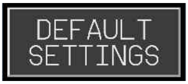


- The ADS-B Traffic function is failed, or
- The TCAS or the XPDR is failed or in standby.

Associated with SURV ADS-B TRAFFIC 1(2) FAULT or SURV ADS-B TRAFFIC 1+2 FAULT ECAM alerts.

Ident.: DSC-34-SURV-60-20-20-00016487.0001001 / 06 AUG 14

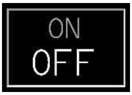
DEFAULT SETTINGS BUTTON



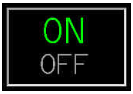
When clicked, a confirmation window appears.
After confirmation, automatically sets the ADS-B TRAFFIC button to ON on both MFDs.

Ident.: DSC-34-SURV-60-20-20-00016488.0001001 / 06 AUG 14

FLT ID DISPLAY ON ND BUTTON



The flight identifications of the traffic do not appear on the associated ND.
This is the default position of the button.



The flight identifications of the traffic that appear on the associated ND are displayed.

Note: *This button has the same function as the TRAF pb of the EFIS CP.*

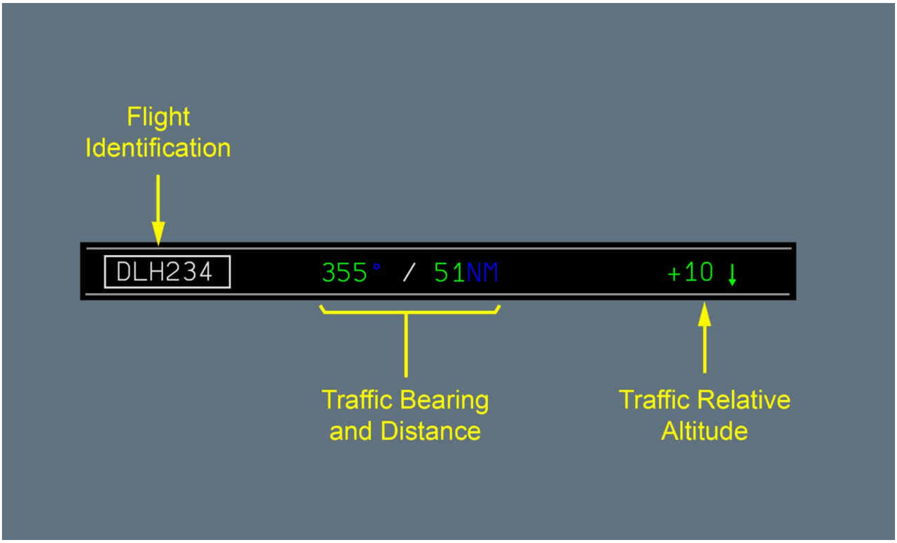
Ident.: DSC-34-SURV-60-20-20-00016489.0001001 / 06 AUG 14

TRAFFIC LIST

This list displays all the traffic that the aircraft can detect, limited to 90 traffic.
The traffic that appear on the ND appear at the top of the list, on a black background. The other traffic appear below, on a dark grey background.

Note: *The flight crew can observe a significant delay for the updating of the traffic list.*

The traffic in these two sub-lists are sorted by alphabetical order of the flight identifications.



FLIGHT IDENTIFICATION

DLH232	Indicates the flight identification of the traffic.
DLH234	The flight crew highlights the traffic.
DLH234	The flight crew selected the traffic. The flight crew can select the traffic via: - The selection of the traffic symbol on the ND, or - The SELECT TRAFF ON ND button.
– – – – – – –	The flight identification is not available. The traffic automatically moves to the end of the corresponding sub-list.

TRAFFIC BEARING AND DISTANCE

Indicates the true or magnetic heading, depending on the position of the TRUE/MAG pb, and the distance of the traffic.
If the bearing value is not available, three dashes appear.

TRAFFIC RELATIVE ALTITUDE

Indicates the relative altitude in hundreds of feet, or the ground status when the traffic is on ground.
A plus (+) or minus (-) symbol appears to the left of the digits, and indicates the position of the traffic based on the position of the aircraft (i.e. the traffic is above (+) or below (-) the aircraft).
An arrow appears to the right of the digits, and indicates the vertical movement of the traffic. No arrow appears when the vertical speed of the traffic is below 500 ft/min.
If the relative altitude is not available, two dashes appear.

Ident.: DSC-34-SURV-60-20-20-00016490.0001001 / 06 AUG 14

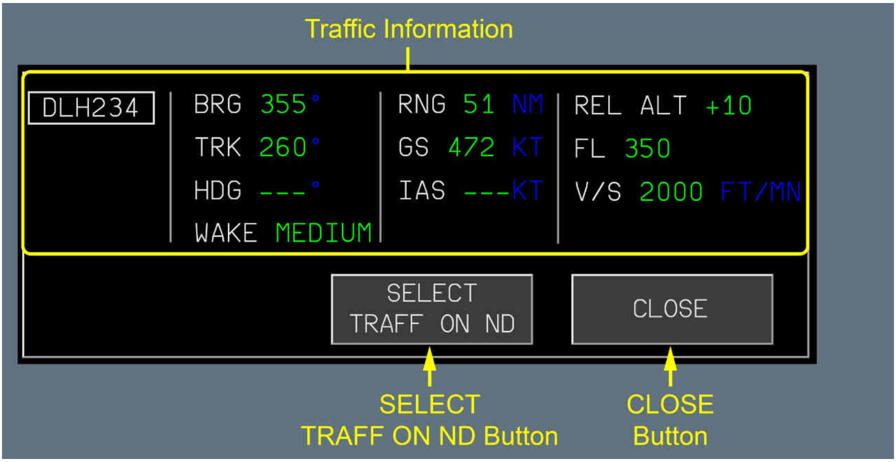
SCROLL BUTTONS

The inner buttons enable the flight crew to move, one by one, downward and upward through the traffic list.
The outer buttons enable the flight crew to move, page by page, downward and upward through the traffic list.

Ident.: DSC-34-SURV-60-20-20-00016491.0001001 / 06 AUG 14

TRAFFIC INFORMATION WINDOW

The traffic information window appears when the flight crew clicks on a traffic area.



DLH234
BRG 355°
TRK 260°
HDG ---°
WAKE MEDIUM
RNG 51 NM
GS 472 KT
IAS ---KT
REL ALT +10
FL 350
V/S 2000 FT/MN

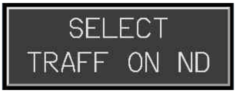
TRAFFIC INFORMATION

Indicates the following data about the selected traffic:

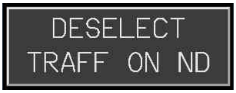
- BRG: The true or magnetic heading, in degrees, depending on the position of the TRUE/MAG pb
- TRK: The true track of the traffic, in degrees
- HDG: The true heading of the traffic, in degrees, if the TRK value is not available
- WAKE: The wake vortex category of the traffic (LIGHT, MEDIUM, or HEAVY)
- RNG: The distance between the aircraft and the traffic, in nautical miles
- GS: The ground speed of the traffic, in knots
- IAS: The indicated airspeed of the traffic, in knots, if the GS is not available
- REL ALT: The relative altitude of the traffic, in hundreds of feet
- FL: The flight level of the traffic
- V/S: The vertical speed of the traffic, in feet per minute.

If the associated information is not available, dashes appear instead of the value.

SELECT TRAFF ON ND BUTTON

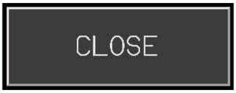


When clicked, the traffic data appears on both NDs, and the label of the button becomes DESELECT TRAFF ON ND.



When clicked, the traffic data no longer appears on the NDs, and the label of the button becomes SELECT TRAFF ON ND.

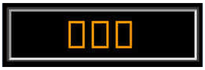
CLOSE BUTTON



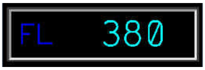
When clicked, closes the traffic information window.

Ident.: DSC-34-SURV-60-20-20-00016591.0001001 / 06 AUG 14

DESIRED FL ENTRY FIELD



The flight crew must enter the flight level value.

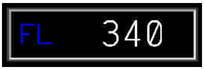


FL 380

The flight crew entered the flight level.

Depending on the value of the DESIRED FL that the flight crew enters, one of the following messages appears:

- ITP LIMITED TO 3000 FT
  This message appears when the flight crew enters a DESIRED FL that exceeds 3 000 ft above or below the current flight level (not in the ITP scope).
  This message informs the flight crew that an altitude change of more than 3 000 ft via the ITP is not possible.
  This message no longer appears when the flight crew enters another value.
- ITP ALT CHANGE > 1000 FT
  This message appears when the flight crew enters a DESIRED FL that does not exceed 1 000 ft above or below the current flight level (not in the ITP scope).
  This message informs the flight crew that an altitude change of less than 1 000 ft via the ITP is not possible.
  This message no longer appears when the flight crew enters another value.
- NO CONFLICTING ADS-B TRAFFIC AT INTERMEDIATE FL
  STANDARD REQUEST READY TO TRANSFER TO MAIL BOX
  This message appears when the ITP is possible (i.e. when there is no conflicting traffic at intermediate flight level).
  The XFR TO MAILBOX button becomes available.



FL 340

The ITP maneuver is engaged.
The entry field is not available, and the VERTICAL MANEUVER IN PROGRESS message appears.

Ident.: DSC-34-SURV-60-20-20-00016592.0001001 / 06 AUG 14

ITP TRAFFIC LIST

For each traffic in the zone of the desired flight level that the flight crew entered, the following information appear:

- The ITP distance
- The aircraft relative position (AHEAD OF/BEHIND) based on the traffic
- The flight identification.

The ITP distance between the aircraft and the traffic, and the relative position of the traffic appear:
- In green when the ITP is possible, or
- In amber when the ITP is not possible.

  In this case, one of the following messages appears to indicate the non-compliance reason:
  - DUE TO REL SPEED, or
  - DUE TO DISTANCE, or
  - DUE TO REL SPEED / DISTANCE.

When the flight crew clicks on a traffic, the traffic information window appears.

Ident.: DSC-34-SURV-60-20-20-00016593.0001001 / 06 AUG 14

ITP STATUS

Indicates:
- In green, the time at which the ITP becomes no longer possible, or
- In amber, the time at which the ITP becomes possible.

When the ITP traffic list contains more than two traffic, the TOO MANY TRAFFIC message appears below the status.

Ident.: DSC-34-SURV-60-20-20-00016594.0001001 / 06 AUG 14

ITP TRAFFIC INFORMATION WINDOW

This window only appears when the flight crew clicks on a traffic in the ITP traffic list.

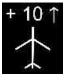
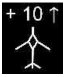
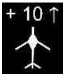
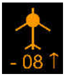
TRAFFIC SYMBOL

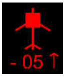
Depending on the traffic display mode, the following symbols indicate the range and location of the traffic:

Surrounding Traffic	TCAS Intruder			
	Other	Proximate	TA	RA
				










- Two digits indicate the relative altitude of the traffic (in hundreds of feet). They appear below the symbol, if the traffic is below the aircraft, and above the symbol if the traffic is above the aircraft
- A plus (+) or minus (-) symbol appears to the left of the digits, and indicates if the traffic is above (+) or below (-) the aircraft
- An arrow indicates the vertical movement of the traffic. No arrow appears if the traffic vertical speed is less than 500 ft/min.

Note: *The flight crew can observe a significant delay for the updating of the traffic information.*

TRAFFIC FLIGHT IDENTIFICATION

Indicates the flight identification of the traffic.

This indication appears when:
- The FLT ID DISPLAY ON ND button is set to ON on the SURV TRAFFIC page of the MFD, or
- The TRAF pb is set to ID on the EFIS CP.

TRAFFIC GROUND SPEED

Indicates the ground speed of the traffic.

TRAFFIC WAKE VORTEX CATEGORY

When available, indicates the wake vortex category of the traffic (L, M, or H).

HOW TO PERFORM AN IN TRAIL PROCEDURE

Ident.: DSC-34-SURV-60-30-00022504.0001001 / 13 JAN 15

Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP

With ITP, ATC can authorize an aircraft to climb or descend with temporarily reduced longitudinal separation from surrounding aircraft, in predefined airspaces, refer to local requirements published in the Aeronautical Information Publication (AIP).

CAUTION	ATC remains responsible for aircraft separation. If any problem occurs during the ITP maneuver, the flight crew must apply the regional contingency procedures (Refer to AIP).

Note: *The following procedure assumes CPDLC is used to communicate with ATC. To request an ITP clearance with Voice Communications, refer to the published phraseology for ITP procedure.*

STEP 1

Select Traffic on the MFD SURV Page.

```

STEP 8

Check the ITP clearance request in the mailbox and send it to ATC.

STEP 9

- **If cleared for ITP:**
  Check if ITP is still possible or not in the ITP Panel.
  - **If ITP is no more possible:**
    Inform ATC that the ITP request is cancelled. Click on the UNABLE button.
  - **If ITP is still possible:**
    Inform ATC that the ITP request is accepted. Click on the WILCO button.
    Perform the ITP without delay.
    Maintain the assigned Mach (or speed) during the ITP.

Maintain a minimum vertical speed of 300 ft/min during the ITP climb or descent.

- **If not cleared for ITP with requested FL but ITP ALTN FL proposed:**
  Request a new ITP clearance to ATC. Restart the procedure from the beginning.

HOW TO USE VISUAL SEPARATION ON APPROACH

Ident.: DSC-34-SURV-60-30-00021598.0001001 / 13 JAN 15
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP

The Visual Separation on Approach (VSA) assist the flight crew to identify an aircraft out of the window during approach following a request by ATC.
When the flight crew uses VSA for visual separation or in case of requested maneuver, the flight crew must maintain visual contact (out the window) with the requested aircraft. The use of VSA does not modify the current visual separation procedure.
When the flight crew uses VSA to identify a traffic, the flight crew must report having the traffic in sight to ATC only if they have a visual contact (out the window) with the traffic. The flight crew must not report a traffic identified on the ND only.

If the flight crew detects that the VSA information on the ND is not consistent, then the flight crew must:
- Stop using VSA, and disregard traffic displayed on the ND
- Only use visual checks to maintain visual separation.

If any problem occurs during an VSA maneuver, the flight crew must apply the regional contingency procedures (Refer to AIP).

SHARED MESSAGE AREA

The shared message area displays messages in order to inform the flight crew about an event that is related to the FMS or ATC communication.
The shared message area displays the following messages:

D-ATIS RECEIVED	Indicates that a new ATIS report is received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.
D-ATIS GROUND MSG	Indicates that an ATIS FSM message is received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.
D-ATIS NO REPLY	Appears when the time-out (7.5 min) is reached and that no ATIS was received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.

D-ATIS SEND FAIL	Appears when an ATIS request failed for one of the following reasons: - The sending of the ATIS request failed, or - The time-out (6 min) for acknowledgement is reached, or - A negative answer for the ATIS request is received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.
CHECK FMS MESSAGE	Indicates that the FMS triggered an amber FMS message. Only appears if the MFD displays a page that is not an FMS page. Disappears when the flight crew accesses an FMS page.
L12	
IND	Indicates that both FMS operate in INDEPENDENT mode. For information about the INDEPENDENT mode, *Refer to DSC-22-FMS-40 INDEPENDENT Mode*.

L2 *Note:* *The shared message area displays only one message at a time. However, the IND message can appear in addition to another message.*

TRAFFIC DATA AND ITP PANELS

The TRAFFIC DATA and ITP Panels enables the flight crew to monitor the ADS-B Traffic function.

SURV MESSAGE AREA

Applicable to: ALL

Ident.: DSC-34-SURV-70-50-40-00002157.0001001 / 30 APR 14

The SURV message area displays messages on two lines of 33 characters.
The flight crew can clear the displayed message by clicking on the CLEAR INFO button, or by pressing the CLR INFO key on the KCCU.

Ident.: DSC-34-SURV-70-50-40-00002176.0001001 / 30 APR 14

ENTRY OUT OF RANGE MESSAGE

If the flight crew enters a value that is not in the correct range, the message area displays:

- The ENTRY OUT OF RANGE message on the first line
- The applicable range on the second line (as indicated in the table below).

Data Type	Out Of Range Messages
ELEVN	■ **If the QNH reference is selected on the EFIS CP baro setting:** RANGE: 0 ft to 60 000 ft ■ **If the STD reference is selected on the EFIS CP baro setting:** RANGE: FL 0 to FL 600
GAIN	RANGE: 0 % to 100 %
TILT	RANGE: -15.0 ° to +15.0 °

Ident.: DSC-34-SURV-70-50-40-00002177.0001001 / 30 APR 14

FORMAT ERROR MESSAGE

If the flight crew enters an ELEVN, GAIN, or TILT value that is not valid, the message area displays:

- The FORMAT ERROR message on the first line
- The applicable format on the second line (as indicated in the table below).

Data Type	Data Format Help Messages
ELEVN	■ **If the QNH reference is selected on the EFIS CP baro setting:** FORMAT: “XXXXX” FT ■ **If the STD reference is selected on the EFIS CP baro setting:** FORMAT: FL “XXX”
GAIN	FORMAT: “XXX” %
TILT	FORMAT: “+/-XX.X” °

Ident.: DSC-34-SURV-70-50-40-00002178.0001001 / 30 APR 14

SQWK CODE NOT VALID MESSAGE

If the flight crew enters a SQWK value that is not valid, the message area displays the SQWK CODE NOT VALID message on the first line.

MFD DATA ENTRY FORMAT

Applicable to: ALL

Ident.: DSC-34-SURV-70-50-50-00002158.0001001 / 30 APR 14

This chapter provides a list of all the data that the flight crew may enter on the MFD.

For each data, the table displays:
- The appropriate format
- The appropriate units
- The appropriate range
- The page(s) on which the flight crew must enter the data.

The following characters are used to indicate the format:
- A: Letters
- B: Magnetic/True reference
- N: Numbers
- X: Letters and Numbers.

Note: *The flight crew can:*
- *Enter the units that are indicated in blue*
- *Omit leading zeros in fields that have numerical data.*

If the flight crew enters an erroneous format, the message area displays the FORMAT ERROR message, followed by the correct format (*Refer to DSC-46-ATC-20-40 FORMAT ERROR*).
If the flight crew enters an erroneous value, the message area displays the ENTRY OUT OF RANGE message, followed by the correct range (*Refer to DSC-46-ATC-20-40 ENTRY OUT OF RANGE*).

AUTOMATIC OPERATION

Applicable to: ALL

Ident.: DSC-34-SURV-80-GAUTO-00003537.0001001 / 30 APR 14

If the flight crew sets the default settings of the SURV system via the DEFAULT SETTINGS button of the SURV/CONTROLS page of the MFD, the SURV system operates as follows:

Ident.: DSC-34-SURV-80-GAUTO-00003544.0001001 / 05 JUN 18

ON GROUND

L2 When the aircraft is on ground, SYS 1(2) is automatically selected as the master AESU if the flight number in the FMS is an odd (even) number. It enables the detection of hidden failures.

L1 The TCAS turns on, and the TRAF pb on the EFIS CP is automatically selected.
The TAWS turns on. The flight crew should press the TERR pb on the EFIS CP to display terrain information.
The XPDR turns on.
The WXR is armed but does not scan the envelope ahead of the aircraft. When the flight crew presses the WX pb on the EFIS CP during the SOP Taxi, it activates the WXR scan and WX information is displayed on the ND and VD.

Ident.: DSC-34-SURV-80-GAUTO-00003545.0001001 / 05 JUN 18

TAKEOFF

If the flight crew does not press the WX pb on the EFIS CP during SOP Taxi:

- The WXR and the PWS are automatically activated at engine takeoff thrust but no information is displayed on the ND and VD
- The PWS image and WX image will be automatically displayed on the ND and VD, only if windshear is detected.

Ident.: DSC-34-SURV-80-GAUTO-00003546.0001001 / 05 JUN 18

LANDING

If the aircraft is below 1 000 ft AGL, the TCAS mode is TA ONLY.

Ident.: DSC-34-SURV-80-GAUTO-00003547.0001001 / 30 APR 14

ON GROUND, AFTER LANDING

60 s after touchdown, the WX pb on the EFIS CP is automatically deselected and the WXR automatically turns off.
The TCAS remains in TA ONLY mode.
The XPDR is in AUTO mode.
The TAWS is operative.

Intentionally left blank

RECONFIGURATIONS

Ident.: DSC-34-SURV-90-00016895.0001001 / 30 APR 14
Applicable to: ALL

If one or more functions of the SURV system fail, the flight crew can manually reconfigure the remaining functions in order to ensure that the system still operates.

If a failure occurs :
- The ECAM triggers the corresponding ECAM alert
- The flight crew must select the SURV SYS that has the operative WXR function. The active WXR function determines the master SYS.

L12

Note: *If the TAWS function fails only on one SYS, the flight crew cannot manually reconfigure the TAWS function. The TAWS indications do not change on the SURV page of the MFD. Only the associated dispatch message indicates the failure.*

The illustration below illustrates some examples of reconfiguration.
Click on a function to set it as failed.
In this illustration, up to two functions can be set as failed.

GENERAL

Ident.: DSC-34-32-10-00016934.0001001 / 04 MAY 16
Applicable to: ALL

The Brake to Vacate (BTV), the Runway Overrun Warning (ROW), and the Runway Overrun Protection (ROP) are related functions of the PRIM that use the same algorithm to:
- Protect the aircraft against runway excursion (ROW and ROP)
- Optimize the automatic braking (BTV).

The ROW:
- Is a warning function that is in operation in flight during approach
- Warns the flight crew if the landing runway is too short.

L2 For more information about the ROW, *Refer to DSC-34-32-20-10 ROW*.

L1 The ROP:
- Is a protection function that is in operation on ground during rollout
- Activates if the remaining landing runway is too short, and orders the flight crew to take appropriate actions to stop the aircraft
- Can also automatically apply maximum braking to the aircraft, when an autobrake mode is active.

L2 For more information about the ROP, *Refer to DSC-34-32-20-10 ROP*.

L1 The BTV is a function that optimizes the autobrake deceleration at landing, in order to reach an exit that the flight crew selected.

L2 For more information about the BTV, *Refer to DSC-34-32-30-10 Overview*.

Ident.: DSC-34-32-10-10-00016937.0001001 / 07 NOV 16

RUNWAY DATA

ANF

The ANF:
- Detects the landing runway
L2 The ANF can detect the landing runway via the ANF database.
L1
- Computes the aircraft position for the ROW, ROP, and BTV functions
- Enables the flight crew to select the landing runway and the BTV exit via the airport moving map
- Provides the flight crew with the display of landing information via the airport moving map (i.e. selected landing runway, selected BTV exit, selected runway condition, LDA, landing distance and runway occupancy time)
- Sends the selected data and the detected landing runway to the PRIMs.
- Enables the flight crew to set the runway condition, as a backup of the RWY COND/BRAKING ACTION selector

TAWS

The TAWS:
- Detects the landing runway
L2 The TAWS can detect the landing runway via the TAWS database.
L1
- Computes the aircraft position for the ROW and ROP functions
- Sends the detected landing runway and the computed aircraft position to the PRIMs
- Sends the slope of the runway that is selected on the ANF to the PRIMs.

L2 ANF AND TAWS DATABASES

The ANF and TAWS databases enable the detection of the landing runway.
The BTV, ROW and ROP functions use both the ANF and the TAWS databases.

Ident.: DSC-34-32-10-10-00016938.0001001 / 05 NOV 15

PRIM 1(2)(3)

The PRIMs host the ROW, ROP, and BTV functions.
The ROW and the ROP computes the landing distance, and runway overrun predictions.
The BTV computes braking orders to reach the selected exit. The BTV uses the landing distance from the ROW and ROP to compute the braking orders.

The ROW sends the runway overrun prediction to:
- The FWS to trigger the corresponding messages and audio indicators
- The ANF and CDS for feedback on the PFD and ND.

The ROP sends:

- The overrun prediction to:
  - The FWS to trigger the corresponding messages and audio indicators
  - The ANF and CDS for feedback on the PFD and ND
- The maximum braking order to the BCS.

In order to protect the aircraft against runway excursion, the ROW and ROP use:

- The runway data from the ANF and the TAWS
- The FMS data, when the aircraft is above the ROW transition altitude.
  L2 For more information about the ROW transition altitude, *Refer to DSC-34-32-20-10 ROW*.
- L1 The ADIRUs data, when the aircraft is below the ROW transition altitude.
  L2 For more information about the ROW transition altitude, *Refer to DSC-34-32-20-10 ROW*.
- L1 The runway condition or braking action that the flight crew selected.

Ident.: DSC-34-32-10-10-00016939.0001001 / 26 APR 14

BRAKING SYSTEM

The BCS controls the braking actuators as per the ROP or BTV orders.

Ident.: DSC-34-32-10-10-00016940.0002001 / 07 JUN 19

A/C DATA

FMS

Above the ROW transition altitude, in order to compute the landing distance for the ROW and BTV functions, the FMS provides the PRIMs with the destination airport information and the associated aircraft data:

- The ICAO code of the destination airport
- The QNH of the destination airport
- The OAT at destination airport
- The wind direction and speed at landing runway
- The approach speed
- The landing configuration
- The predicted LW.

L2 For more information about the ROW transition altitude, *Refer to DSC-34-32-20-10 ROW*.

L1 **ADIRUS**

Below the ROW transition altitude, in order to compute the landing distance for the ROW, ROP, and BTV functions, the ADIRUs provide the PRIMs with:
- The current GS
- The OAT
- The pressure altitude.

L2 For more information about the ROW transition altitude, *Refer to DSC-34-32-20-10 ROW*.

Ident.: DSC-34-32-10-10-00020784.0001001 / 26 APR 14

BRAKE PANEL

The brake panel enables the flight crew to set the runway condition/ braking action, and to arm, or disarm the BTV.

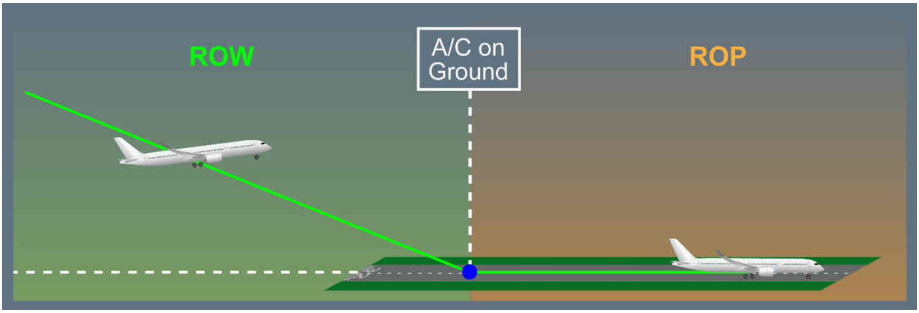
Intentionally left blank

OVERVIEW

Ident.: DSC-34-32-20-10-00016941.0001001 / 04 DEC 14
Applicable to: ALL

The ROW and ROP functions alert the flight crew if a potential runway overrun is detected at landing, both in manual or automatic braking.
The ROW function is armed during the airborne phase of landing (before the ROW/ROP transition point), and the ROP function is armed during the ground phase of landing (after the ROW/ROP transition point).

ROW/ROP Transition Point



L12

Note: *The ROW/ROP transition point is the point where the aircraft is confirmed to be on ground.*

The aircraft is at the ROW/ROP transition point when one of the following occurs:
- *The nose landing gear is on ground, or*
- *The ground spoilers are extended for 5 s.*

The ROW and ROP functions:
- Monitor the computed landing distance (ROW and ROP)
- Predict potential landing runway overrun in flight (ROW) and during rollout (ROP)
- Provide specific indications on the displays for runway overrun monitoring in flight (ROW) and during rollout (ROP)
- If the landing runway is too short:
  - Trigger the applicable aural and visual alerts (ROW and ROP)
  - Automatically order maximum braking, when the BRK MED or the BTV is active (ROP).

Note: *In the case of a failure affecting the landing performance, the ROW line on the ANF is not displayed and the ROW/ROP remains armed. Alerts may be triggered based on the landing distance computed without failure.*

ROW

Ident.: DSC-34-32-20-10-00016942.0001001 / 07 NOV 16
Applicable to: ALL

ABOVE THE ROW TRANSITION ALTITUDE

The PRIMs compute the ROW landing distance based on predictive data, the associated ROW line is steady.

L2 The PRIMs compute the ROW landing distance based on:
- The FMS data at destination (e.g. QNH of the destination airport, OAT, predicted LW)
- The data of the selected landing runway. (The default runway is the FMS landing runway. The flight crew can select another runway via the ANF.)
- The average runway slope
- The runway condition or the braking action that the flight crew has selected
- A realistic manual or automatic landing, normal flare, and de-rotation technique
- Maximum braking
- IDLE REV, when the selected runway condition/braking action is DRY-6
- MAX REV, when the selected runway condition/braking action is different from DRY-6.

L1 If a runway overrun is predicted, the ROW displays a message on the ND.

BELOW THE ROW TRANSITION ALTITUDE

The ROW is automatically armed as soon as the landing runway is detected.
The PRIMs compute the ROW landing distance based on real time data, for the detected runway.
The associated ROW line can move.

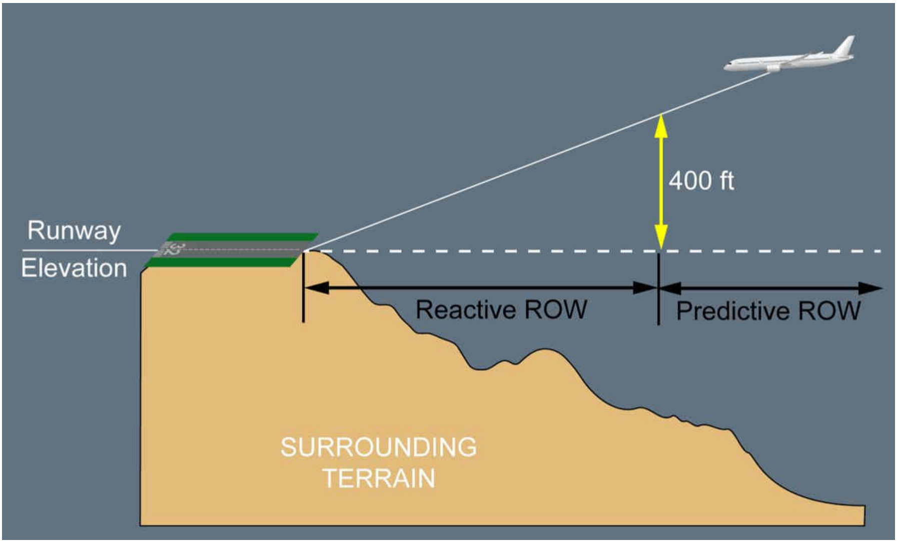
L2 The PRIMs compute the landing distance based on:
- The landing runway that the ANF and the TAWS detect
- The runway condition or the braking action that the flight crew has selected
- The current data of the aircraft (e.g. aircraft position, landing configuration, wind direction and speed)
- The average slope
- A realistic manual or automatic landing, normal flare, and de-rotation technique
- Maximum braking
- IDLE REV, when the selected runway condition/braking action is DRY-6
- MAX REV, when the selected runway condition/braking action is different from DRY-6.

L1 If a runway overrun is predicted, the ROW triggers alerts.
For specific cases, the flight crew can manually deactivate the ROW.

L2 ROW TRANSITION ALTITUDE

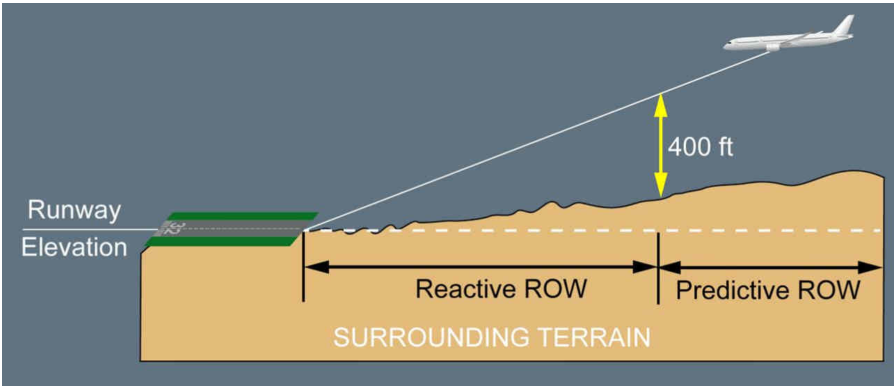
The ROW transition altitude is the altitude where the ROW changes from a predictive logic to a reactive logic.
In order to cover the situations where the surrounding terrain is above or below the runway, the ROW transition altitude, and the triggering of the associated ROW alerts are based on the minimum value between the radio altitude and the aircraft height above the runway threshold.

Surrounding Terrain Below The Runway Threshold



400 ft
Runway
Elevation
Reactive ROW
Predictive ROW
SURROUNDING
TERRAIN

Surrounding Terrain Above The Runway Threshold



ROP

Ident.: DSC-34-32-20-10-00016943.0001001 / 08 JUL 19
Applicable to: ALL

The ROP is automatically armed from the ROW/ROP transition point until the aircraft ground speed reaches 30 kt.
The ROP provides the flight crew with the stop bar, when the BRK MED or BTV is active.
The stop bar corresponds to the computed landing distance.

L2 The PRIMs compute the landing distance based on:
- The landing runway that the ANF and the TAWS detect
- The runway condition or braking action that the flight crew selects
- The current data of the aircraft (e.g. aircraft position and speed, landing configuration, wind direction and speed).

L1 If the ROP detects an overrun situation, the ROP:
- In manual braking, triggers alerts, or
- When the BRK MED or BTV is active, triggers alerts and automatically activates the maximum braking.

L2 When the ROP is active, the only possible method to disconnect the autobrake is for the flight crew to apply sufficient pedal deflection on the brake pedals. In this situation, the flight crew reverts to pedal braking. Nevertheless, the ROP remains active as long as a runway overrun is detected.

RUNWAY CONDITION DEGRADATION

Ident.: DSC-34-32-20-10-00023375.0001001 / 27 FEB 17
Applicable to: ALL

When the antiskid activates, the PRIM can downgrade the selected runway condition / braking action. The runway condition degradation is designed to provide awareness to the flight crew via a message on the FMA (*Refer to DSC-34-32-20-20-35 FMA*). The updated runway condition / braking action is set in the RWY CONDITION / BRAKING ACTION matrix, and is displayed on the ND (*Refer to DSC-34-32-20-20-50 RWY COND/BRAKING ACTION (ARC Mode)*). When an autobrake mode is active, the computation of the stop bar displayed on the ANF takes into account the downgraded runway condition / braking action.

L2 When the antiskid activates, the PRIM computes a runway friction coefficient based on the aircraft deceleration. This coefficient is compared to the coefficient that is associated with the runway condition/braking action that the flight crew selected. If the computed friction coefficient is significantly less than the selected coefficient, the PRIM downgrades the selected runway condition/braking action. The PRIM can downgrade the runway condition / braking action as much as necessary.

L1 *Note:* 1. *The runway condition degradation does not improve the braking performance, because it activates only when the antiskid is active.*
2. *The runway condition may become better along the runway, however the PRIM cannot upgrade the runway condition / braking action.*

Applicable to: ALL

Audio Indicator	Condition or Cause	Duration
Runway Too Short, Runway Too Short (Synthetic voice)	Runway too short. The aircraft is in flight, below 200 ft, and the ROW predicts that the landing runway is too short.	Sounds as long as: - The ROW predicts that the landing runway is too short - The flight crew does not perform a go-around.
Set Max reverse (Synthetic voice)	Runway too short. - The aircraft is on ground, the ground speed is above 80 kt, and the ROP predicts that the landing runway is too short with a degraded runway condition (e.g. WATER/SLUSH-2 if WET-5 is selected) - The thrust reverser levers are not set to MAX REV.	Sounds one time. Is inhibited as long as all of the following occur: - The rudder deflection is more than 2/3 of the maximum rudder travel - Differential braking is detected.
	Runway too short. The aircraft is on ground and the ROP predicts that the landing runway is too short for the selected runway condition.	Sounds as long as the thrust reverser levers are not set to the MAX REV position. Is inhibited as long as all of the following occur: - The rudder deflection is more than 2/3 of the maximum rudder travel - Differential braking is detected.

Continued on the following page

Continued from the previous page

Audio Indicator	Condition or Cause	Duration
Keep Max Reverse (Synthetic voice)	Runway too short. - The aircraft is on ground and the ROP predicts that the landing runway is too short - The ground speed is 80 kt or below - The thrust reverser levers are set to MAX REV.	Sounds one time. Is inhibited as long as all of the following occur: - The rudder deflection is more than 2/3 of the maximum rudder travel - Differential braking is detected.
Brake, Max Braking, Max Braking (Synthetic voice)	Runway too short. - The aircraft is on ground and the ROP predicts that the landing runway is too short - Neither the BTV nor the BRK MED is active - The full pedal braking is not applied - This audio indicator has priority over the “SET MAX REVERSE” one	Sounds as long as: - The ROP predicts that the landing runway is too short - The flight crew does not apply maximum braking.

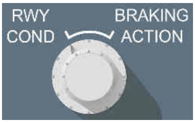
RWY COND/BRAKING ACTION KNOB-SELECTOR

L12



- The knob has two positions: RWY COND and BRAKING ACTION. For more information,*Refer to DSC-34-32-20-20-70 RWY COND/BRAKING ACTION Mode*.
- When the selector is turned, sets the runway condition or braking action. After selection, the entry is automatically validated after a few seconds. If the flight crew selects a contaminated runway, or if the initial selection was a contaminated runway, the RWY CONDITION / BRAKING ACTION matrix automatically appears on the SD.
- When the selector is pulled, the RWY CONDITION / BRAKING ACTION matrix appears on the SD.
- When the selector is pushed, the RWY CONDITION / BRAKING ACTION matrix disappears.

L2 The flight crew can also select the RWY CONDITION / BRAKING ACTION via the LANDING panel of the ANF. For more information, *Refer to DSC-34-32-20-20-50 LDG PERF CODE List*.

LANDING RUNWAY (PLAN MODE)

Indicates the landing runway.

- The computed landing distance is less than the LDA.
- The landing runway is the runway that the flight crew selected via the FMS.

- The computed landing distance is less than the LDA.
- The flight crew selected a landing runway that is different from the FMS runway.

- The landing runway is too short
- The aircraft is above 200 ft.

- The landing runway is too short
- The aircraft is below 200 ft.

Ident.: DSC-34-32-20-20-50-10-00019502.0002001 / 27 FEB 17

LDA

Indicates the Landing Distance Available (LDA) as displayed on the LANDING panel of the ANF.

L2 Appears in feet (ft) with the US unit of length ◁ option.

L1

The computed landing distance is less than the LDA.

- The flight crew modified the LDA via the LANDING panel
- The computed landing distance is less than the LDA.

- The landing runway is too short
- The aircraft is above 200 ft.

- The landing runway is too short
- The aircraft is below 200 ft.

The system cannot compute the landing distance.

Ident.: DSC-34-32-20-20-50-10-00019503.0002001 / 27 FEB 17

RWY COND / BRAKING ACTION (PLAN MODE)

Indicates the runway condition or the braking action that the flight crew selected via the RWY CONDITION/BRAKING ACTION selector of the BRAKE Panel, or the LDG PERF CODE list of the ANF LANDING panel.

L2 The default runway condition is initialized to WET-5 before the flight.
After a go-around, a change of the selected runway, or a change of the autobrake mode, the selected runway condition/braking action remains the same.

L1 The selected runway condition or the selected braking action can be displayed in the following colors:

The computed landing distance is less than the LDA.

- The landing runway is too short, and
- The aircraft is above 200 ft.

- The landing runway is too short, and
- The aircraft is below 200 ft.

The system cannot compute the landing distance.

Ident.: DSC-34-32-20-20-50-10-00019504.0001001 / 02 OCT 14

LANDING RUNWAY (ARC MODE)

- The computed landing distance is less than the LDA, and
- The landing runway is the runway that the flight crew selected via the FMS.

- The computed landing distance is less than the LDA, and
- The flight crew selected a landing runway that is different from the FMS runway.

- The landing runway is too short, and
- The aircraft is above 200 ft.

- The landing runway is too short, and
- The aircraft is below 200 ft.

Ident.: DSC-34-32-20-20-50-10-00019505.0001001 / 02 OCT 14

TOO SHORT MESSAGE

- The landing runway is too short, and
- The aircraft is above 200 ft.

- The landing runway is too short, and
- The aircraft is below 200 ft.

- The computed landing distance is less than the LDA, and
- The BTV is not armed.

L2 This area can also display the selected BTV exit. The TOO SHORT message has priority over the BTV Exit. For more information about the BTV Exit, *Refer to DSC-34-32-30-20-60 BTV EXIT*.

Ident.: DSC-34-32-20-20-50-10-00016974.0002001 / 27 FEB 17

RWY COND / BRAKING ACTION (ARC MODE)

Indicates the runway condition or the braking action that the flight crew selected via the RWY CONDITION/BRAKING ACTION selector of the BRAKE Panel, or the LDG PERF CODE list of the ANF LANDING panel.

L2 The default runway condition is initialized to WET-5 before the flight.
After a go-around, a change of the selected runway, or a change of the autobrake mode, the selected runway condition/braking action remains the same.

L1 The selected runway condition or the selected braking action can be displayed in the following colors:

 DRY-6	The computed landing distance is less than the LDA.
 DRY-6	- The landing runway is too short, and - The aircraft is above 200 ft.
 DRY-6	- The landing runway is too short, and - The aircraft is below 200 ft.
 DRY-6	The system cannot compute the landing distance.

Note: When the selected runway condition/braking action is not yet validated, the display appears in black on a colored background. For example :

 DRY-6	*The flight crew selected DRY, the entry will be automatically validated after a few seconds, and the runway is too short for this runway condition.*

Ident.: DSC-34-32-20-20-50-10-00016970.0002001 / 27 FEB 17

ROW/ROP MESSAGES

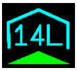
 LDG/FMS RWY DISAGREE	- The selected landing runway is not the FMS runway - The BTV is not armed.
 RWY TOO SHORT	- The runway is too short - The aircraft is above 200 ft.
 RWY TOO SHORT	- The runway is too short - The aircraft is below 200 ft.
 UNKNOWN LDG RWY	- Neither the ANF nor the TAWS detects the landing runway - The aircraft is below 50 ft. - This message can be displayed in PLAN, ARC or ROSE-NAV modes of the ANF
 UNKNOWN SELECTED RWY	The selected landing runway on the ANF is: - Not available in the TAWS database, or - Not valid for ROW/ROP in the TAWS database.

Ident.: DSC-34-32-20-20-50-10-00016971.0001001 / 26 APR 14

RUNWAY

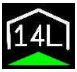
- The blue color indicates the selected landing runway
- The green triangle indicates the FMS runway.

L12



The runway 14L is the selected landing runway, and the FMS runway.
By default, the selected landing runway is the FMS runway.

The runway 14L is the selected landing runway, but not the FMS runway.

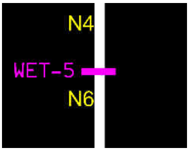


The runway 14L is the FMS runway, but not the selected landing runway.

Ident.: DSC-34-32-20-20-50-10-00016972.0001001 / 02 OCT 14

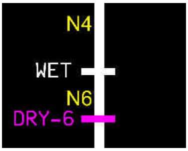
ROW LINES OR STOP BAR

ROW LINES

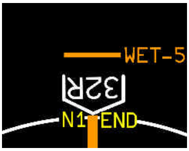


- The label indicates the selected runway condition or braking action
- The aircraft is in flight.

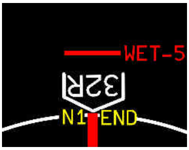
L12



- The WET line is displayed when the flight crew selects DRY-6 as the runway condition or braking action.
  If the flight crew selects BRAKING ACTION, the WET label changes to GOOD.
- Neither the BRK MED nor the BTV is armed
- The aircraft is above 500 ft.



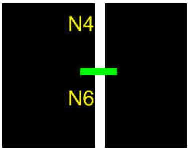
- The landing runway is too short
- The aircraft is above 200 ft
- The label indicates the selected runway condition or braking action.



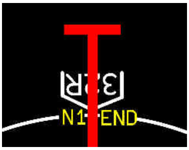
- The landing runway is too short
- The aircraft is below 200 ft
- The label indicates the selected runway condition or braking action.

L2 For more information about ROW lines with BTV armed, *Refer to DSC-34-32-30-20-60 ROW Lines or Stop Bar*.

L1 **STOP BAR**



- The aircraft is on ground
- The BRK MED is active.



- The runway is too short
- The aircraft is on ground
- The BRK MED or the BTV is active.

L2 For more information about stop bars with BTV armed, *Refer to DSC-34-32-30-20-60 ROW Lines or Stop Bar*.

Ident.: DSC-34-32-20-20-50-10-00020550.0001001 / 07 NOV 16

MODIFY RWY BUTTON

The flight crew can shift the runway threshold or the runway end.

L2 The flight crew can modify only one runway. If another runway is modified, the modification of the previous runway is cleared.
When BTV is armed, the THRESHOLD SHIFT entry field, and the END SHIFT entry field are disabled.

L1 *Note:* *If BTV is armed on a shifted runway, the flight crew may clear this shift if they try to enter a shift on another runway. In this case, BTV remains armed and will revert to BRK MED when the aircraft will be below 300 ft.*

L3 The shifted landing distance is removed:
- 5 min after the last engine shutdown, or
- When the flight crew changes the ANF database cycle.

L1 When the flight crew validates the runway shift with the return button, the runway shift is displayed on the MAP DATA panel.

Ident.: DSC-34-32-20-20-50-10-00019981.0001001 / 09 MAR 16

RWY INFORMATION

Indicates the selected runway for ROW/ROP and BTV, and the available landing distance.

L2 The landing distance available appears in feet (ft) with the US unit of length ◁✳ option.

Ident.: DSC-34-32-20-20-50-10-00019982.0001001 / 09 MAR 16

ROW LDG DIST INFORMATION

Indicates the distance between the runway threshold (or modified threshold) and the ROW line.

L2 Appears in feet (ft) with the US unit of length ⊲✻ option.

L1 The value can be displayed in:
- Amber, when the ROW LDG DIST is more than the LDA, or
- Green, when the ROW LDG DIST is less than the LDA.

Ident.: DSC-34-32-20-20-50-10-00019983.0002001 / 27 FEB 17

LDG PERF CODE LIST

The flight crew can select the runway condition.

Note: The LDG PERF CODE can be set only if a runway is selected.

L2 The following selection is available:

Runway Condition	Braking Action
DRY-6	DRY-6
WET-5	GOOD-5
COMP SNOW-4	GOOD TO MED-4
SNOW/SLIP-3	MEDIUM-3
WATER/SLUSH-2	MED TO POOR-2
ICE-1	POOR-1

The flight crew can also use the RWY COND/BRAKING ACTION selector of the BRAKE panel. For more information, *Refer to DSC-34-32-20-20-30 RWY COND/BRAKING ACTION Knob-Selector*.

Ident.: DSC-34-32-20-20-50-10-00019995.0001001 / 26 APR 14

SET LDG RWY ITEM

The SET LDG RWY item is available when the flight crew clicks on a runway. The FMS landing runway is the default selection. The flight crew uses the SET LDG RWY item to select a runway that is different from the FMS landing runway.

Ident.: DSC-34-32-20-20-50-10-00023855.0001001 / 07 NOV 16

ARROW

A blue arrow is displayed on the selected landing runway, next to the threshold.
If the flight crew inserts a threshold shift, the blue arrow also shifts in order to remain next to the threshold.

COMPUTATION INPUTS

Indicates the inputs for the computation of the ROW landing distance.
Above the ROW transition altitude, the APPR panel of the FMS PERF page provides the inputs for the computation of the ROW landing distance.

L2 For more information about the ROW transition altitude,*Refer to DSC-34-32-20-10 ROW*.

L1 Below the ROW transition altitude, the computation inputs are real-time values, and dashes are displayed.

L2 For more information about the ROW transition altitude, *Refer to DSC-34-32-20-10 ROW*.

If the entry fields of the APPR panel are empty, the ROW uses default values.
If the landing runway is neither selected nor detected, no value appears.
The ICAO code of the destination airport and the runway can appear in blue if the flight crew selected a destination airport or a runway in the ANF that is not the FMS runway.

Ident.: DSC-34-32-20-20-70-10-00016984.0002001 / 27 FEB 17

RWY COND/BRAKING ACTION SELECTION

The blue rectangle indicates the selected runway condition/braking action. The runway condition / braking action is manually selected by the flight crew, or automatically selected in the case of a runway condition degradation.

When selected, the line is displayed in the following colors:
- In green, if the computed landing distance is less than the LDA. This is confirmed with associated green indications on ND.
- In amber, if the runway is too short. This is confirmed with associated amber information on ND.
- In white, if the landing distance cannot be computed. This is confirmed with white indication or absence of information on ND.

Ident.: DSC-34-32-20-20-70-10-00023626.0001001 / 07 NOV 16

RWY COND/BRAKING ACTION MODE

The white rectangle can indicate either RWY CONDITION or BRAKING ACTION, depending on the position of the RWY COND/BRAKING ACTION knob.
The selection of RWY CONDITION or BRAKING ACTION mode has an effect only on the display of the selected LDG PERF CODE (e.g. for a LDG PERF CODE 5, the display can be WET-5 or GOOD-5).

Ident.: DSC-34-32-20-20-70-10-00023434.0001001 / 27 FEB 17

TOO SHORT SELECTION

Indicates that, for the corresponding runway condition/braking action, the landing runway is too short.

OVERVIEW

Ident.: DSC-34-32-30-10-00016951.0002001 / 27 FEB 17
Applicable to: ALL

The Brake To Vacate (BTV) is a function that optimizes the autobrake deceleration at landing, in order to reach an exit that the flight crew selected.

The BTV has two modes of operation depending on the selected runway condition/braking action:
- BTV on dry and wet runways,
- BTV CONTAM on contaminated runways.

The FMA indicates the selected mode.
L2 For more information, *Refer to FCTM/AS-BTV BTV Principle*.

PRINCIPLE

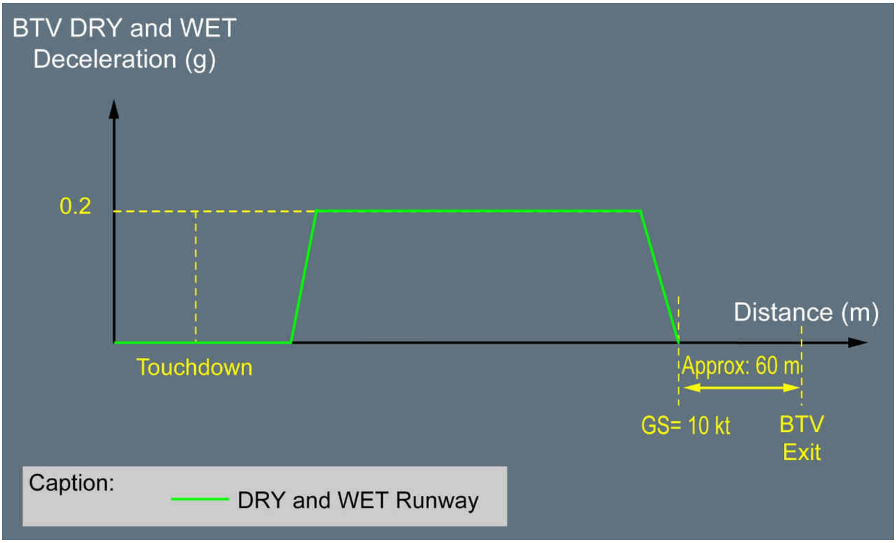
Ident.: DSC-34-32-30-10-00016952.0003001 / 29 JAN 19
Applicable to: ALL

DRY AND WET RUNWAYS

The runway is considered dry or wet if the selected LDG PERF CODE is 6 or 5.

On dry and wet runways, BTV:
- Can delay braking, in order to optimize the brake use, the runway occupancy time (ROT), and the passengers comfort
- Takes into account the distance between the aircraft and the selected exit, in order to release braking when the ground speed is approximately 10 kt, approximately 60 m (200 ft) before the selected exit. If the BTV exit is the runway end, the BTV target is 300 m before the runway end.
- Orders a maximum deceleration of 0.2 g. In the case of a significant BTV exit distance, the maximum deceleration may not be reached. In order to anticipate an exit missed situation, BTV can order a deceleration up to 0.35 g.

BTV Deceleration Logic

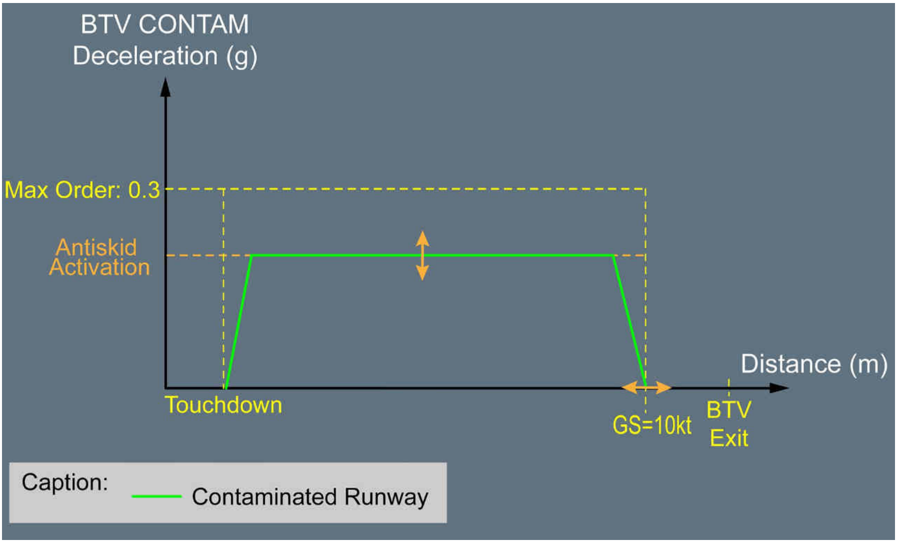


CONTAMINATED RUNWAYS

The runway is considered contaminated if the selected LDG PERF CODE is 4 or less than 4.

On contaminated runways, BTV CONTAM:
- Does not delay the braking
- Orders a deceleration of 0.3 g (up to 0.35 g in anticipation to an exit missed situation). On contaminated runways, these maximum deceleration orders may not be reached due to antiskid activation.
- Does not take into account the distance between the aircraft and the selected exit, and releases the braking when the ground speed is approximately 10 kt.

BTV CONTAM Deceleration Logic



BTV ARMING

Ident.: DSC-34-32-30-10-00016953.0002001 / 27 FEB 17
Applicable to: ALL

BTV or BTV CONTAM arms when all of the following conditions occur:
- The flight crew set a BTV exit beyond the ROW line of the selected landing runway
- The flight crew presses the A/BRK pb
- There is no failure that affects the landing distance.

BTV arms if the runway condition that the flight crew selected is dry or wet. Otherwise, BTV CONTAM arms.
When armed, the FMA displays BTV or BTV CONTAM.

BTV DISARMING

Ident.: DSC-34-32-30-10-00016954.0002001 / 08 JUL 19
Applicable to: ALL

The BTV function can disarm in flight.

BTV MODE CHANGE

BTV changes to BTV CONTAM if the flight crew selects a contaminated runway condition (LDG PERF CODE at or below 4).
BTV CONTAM changes to BTV if the flight crew selects a dry or wet runway (LDG PERF CODE 6 or 5).

L2 *Note:* *At 800 ft, the selected runway condition is memorized, the runway condition can then be changed, but an upgrade above the runway condition that is memorized at 800 ft is not possible.*

L1 When the BTV mode change occurs:
- A triple click audio indicator sounds
- The new autobrake mode appears on the FMA with a white box during 10 s.

L2 If the mode change occurs below 200 ft, the triple click will sound on ground, when the new BTV mode activates.

L1 REVERSION TO BRK MED

BTV or BTV CONTAM reverts to BRK MED if one of the following occurs:
- The flight crew lands on a runway that is different from the selected landing runway, or
- There is a failure, or a combination of failures that affects the landing distance.

When a reversion occurs:
- A triple click audio indicator sounds
- The new autobrake mode appears on the FMA with a white box during 10 s.

L2 If the reversion occurs below 200 ft, the triple click will sound on ground, when BRK MED engages.

L1 AUTOBRAKE DISARMING

The autobrake disarms if one of the following occurs while BTV or BTV CONTAM is armed:
- The flight crew presses the A/BRK pb, or
- The flight crew modifies the selected landing runway on the ANF, or
- The flight crew deselects the BTV exit, or
- The flight crew changes the FMS runway to a runway that is different from the selected landing runway, or

  L2 The flight crew cannot modify the FMS runway below 700 ft RA.
- L1 The flight crew performs a go-around below 600 ft.

  L2 The reversion occurs during the go-around, when the aircraft climbs above 600 ft
  The computation is based on the minimum between the radio altitude, and the aircraft height above the runway threshold.

L1 When the autobrake disarms, all of the following occur:
- An aural indicator sounds (single chime or synthetic voice)
- The MASTER CAUT lights come on
- The AUTO BRK OFF memo appears on the PFD and WD.

Note: *On ground, if the flight crew presses one time the A/THR instinctive disconnect pb, the autobrake disconnects. Immediately after, if the flight crew presses a second time the A/THR instinctive disconnect pb, the AUTO BRK OFF memo disappears and the corresponding audio indicator is not emitted.*

BTV ENGAGEMENT

Ident.: DSC-34-32-30-10-00016955.0002001 / 27 FEB 17
Applicable to: ALL

BTV or BTV CONTAM engages when all of the following conditions occur:
- BTV or BTV CONTAM is armed
- - Immediately after ground spoilers extension if the NLG is on ground, or
  - 5 s after ground spoilers extension, if the NLG is not on ground.

L2 For more information about the ground spoilers extension, *Refer to DSC-27-10-10 Ground Spoiler Control*.

L1 When engaged, the FMA displays BTV or BTV CONTAM.

BTV DISENGAGEMENT

Ident.: DSC-34-32-30-10-00016956.0002001 / 27 FEB 17
Applicable to: ALL

The BTV function can disengage on ground, during rollout.

BTV MODE CHANGE

BTV changes to BTV CONTAM in the case of an automatic degradation of the selected runway condition, from dry or wet to contaminated.

L2 BTV CONTAM cannot change to BTV.

L1 When there is a change to BTV CONTAM, all of the following occur:
- The message RWY COND DEGRADED is displayed on the FMA

L2 For more information, *Refer to DSC-34-32-20-20-35 FMA*.

L1
- The degraded runway condition is displayed in reverse video on the ND.

L2 For more information, *Refer to DSC-34-32-20-20-50 RWY COND/BRAKING ACTION (ARC Mode)*.

For more information, *Refer to DSC-34-32-20-10 Runway Condition Degradation*.

L1

REVERSION TO BRK MED

BTV or BTV CONTAM reverts to BRK MED if the BTV function becomes inoperative.

When a reversion occurs:
- A triple click audio indicator sounds
- The new autobrake mode appears on the FMA with a white box during 10 s.

AUTOBRAKE DISENGAGEMENT

The autobrake disengages if one of the following occurs while BTV or BTV CONTAM is active:
- The aircraft ground speed reaches the BTV disconnection speed (approx. 10 kt), or
- The flight crew uses the brake pedals, or
- The flight crew presses the A/THR instinctive disconnect pb, or
- The ground spoilers retract or disarm.

L2

For more information about the ground spoilers retraction, *Refer to DSC-27-10-10 Ground Spoiler Control*.

L1

When the autobrake disarms, all of the following occur:
- A single chime audio indicator sounds
- The MASTER CAUT lights comes on
- The AUTO BRK OFF memo appears on the PFD and WD.

Audio Indicator	Condition or Cause	Duration
Single Chime (Sound)	Reversion from BTV to manual braking.	Sounds one time.
Triple Click (Sound)	Exit missed or A/BRK reversion. - The BTV detects on ground that the BTV exit will be missed, or - Reversion from BTV to BRK MED. If the reversion occurs below 200 ft, the triple click will sound only after the activation of the BRK MED. - Mode change from BTV to BTV CONTAM or from BTV CONTAM to BTV. If the mode change occurs below 200 ft, the triple click will sound only after the activation of the new mode.	Sounds one time.

L12

RWY
COND
BRAKING
ACTION

- The knob has two positions: RWY COND and BRAKING ACTION. For more information,*Refer to DSC-34-32-20-20-70 RWY COND/BRAKING ACTION Mode*.
- When the selector is turned, sets the runway condition or braking action. After selection, the entry is automatically validated after a few seconds. If the flight crew selects a contaminated runway, or if the initial selection was a contaminated runway, the RWY CONDITION / BRAKING ACTION matrix automatically appears on the SD.
- When the selector is pulled, the RWY CONDITION / BRAKING ACTION matrix appears on the SD.
- When the selector is pushed, the RWY CONDITION / BRAKING ACTION matrix disappears.

L2 The flight crew can also select the RWY COND/BRAKING ACTION via the LANDING panel of the ANF. For more information, *Refer to DSC-34-32-20-20-50 LDG PERF CODE List*.

LANDING RUNWAY (PLAN MODE)

Indicates the landing runway.

14L	- The computed landing distance is less than the LDA. - The landing runway is the runway that the flight crew selected via the FMS.
14L	- The computed landing distance is less than the LDA. - The flight crew selected a landing runway that is different from the FMS runway.
14L	- The landing runway is too short - The aircraft is above 200 ft.
14L	- The landing runway is too short - The aircraft is below 200 ft.

Ident.: DSC-34-32-30-20-60-10-00019542.0002001 / 27 FEB 17

LDA

Indicates the Landing Distance Available (LDA) as displayed on the LANDING panel of the ANF.

L2 Appears in feet (ft) with the US unit of length option.

L1

3000 M	The computed landing distance is less than the LDA.
3000 M	- The flight crew modified the LDA via the LANDING panel - The computed landing distance is less than the LDA.
3000 M	- The landing runway is too short - The aircraft is above 200 ft.
3000 M	- The landing runway is too short - The aircraft is below 200 ft.
3000 M	The system cannot compute the landing distance.

Ident.: DSC-34-32-30-20-60-10-00019526.0002001 / 27 FEB 17

RWY COND / BRAKING ACTION (PLAN MODE)

Indicates the runway condition or the braking action that the flight crew selected via the RWY CONDITION/BRAKING ACTION selector of the BRAKE Panel, or the LDG PERF CODE list of the ANF LANDING panel.

L2 The default runway condition is initialized to WET-5 before the flight.
After a go-around, a change of the selected runway, or a change of the autobrake mode, the selected runway condition/braking action remains the same.

L1 The selected runway condition or the selected braking action can be displayed in the following colors:

DRY-6	The computed landing distance is less than the LDA.

DRY-6	- The landing runway is too short, and - The aircraft is above 200 ft.
DRY-6	- The landing runway is too short, and - The aircraft is below 200 ft.
DRY-6	The system cannot compute the landing distance.

Ident.: DSC-34-32-30-20-60-10-00019559.0001001 / 02 OCT 14

LANDING RUNWAY (ARC MODE)

LDG14L	- The computed landing distance is less than the LDA, and - The landing runway is the runway that the flight crew selected via the FMS.
LDG14L	- The computed landing distance is less than the LDA, and - The flight crew selected a landing runway that is different from the FMS runway.
LDG14L	- The landing runway is too short, and - The aircraft is above 200 ft.
LDG14L	- The landing runway is too short, and - The aircraft is below 200 ft.

Ident.: DSC-34-32-30-20-60-10-00019979.0002001 / 28 APR 17

RWY COND / BRAKING ACTION (ARC MODE)

Indicates the runway condition or the braking action that the flight crew selected via the RWY CONDITION/BRAKING ACTION selector of the BRAKE Panel, or the LDG PERF CODE list of the ANF LANDING panel.

L2 The default runway condition is initialized to WET-5 before the flight.
After a go-around, a change of the selected runway, or a change of the autobrake mode, the selected runway condition/braking action remains the same.

L1 The selected runway condition or the selected braking action can be displayed in the following colors:

DRY-6	The computed landing distance is less than the LDA.
DRY-6	- The landing runway is too short, and - The aircraft is above 200 ft.
DRY-6	- The landing runway is too short, and - The aircraft is below 200 ft.
DRY-6	The system cannot compute the landing distance.

Note: *When the selected runway condition/braking action is not yet validated, the display appears in black on a colored background. For example :*

DRY-6	*The flight crew selected DRY, the entry will be automatically validated after a few seconds, and the runway is too short for this runway condition.*

Ident.: DSC-34-32-30-20-60-10-00019527.0001001 / 09 MAR 16

BTV EXIT

The BTV exit can be displayed in one of the following colors:

N2	The selected BTV exit is accessible.
N2	The selected BTV exit will be missed.

L2 This area can also display the RWY TOO SHORT message that has priority over the BTV exit. For information about the RWY TOO SHORT message, *Refer to DSC-34-32-20-20-50 TOO SHORT Message*.

Ident.: DSC-34-32-30-20-60-10-00019529.0001001 / 09 MAR 16

BTV EXIT DISTANCE

Indicates the distance between the threshold or the modified threshold and the selected BTV exit.

L2 Appears in feet (ft) with the US unit of length ⩤ option.

L1

2500 M	The selected BTV exit is accessible.
2500 M	The selected BTV exit will be missed.

Ident.: DSC-34-32-30-20-60-10-00019530.0001001 / 26 APR 14

BTV EXIT INFORMATION

TOO SHORT	The selected BTV exit will be missed.
AFTER RWY END	The selected BTV exit is beyond the runway end. This can occur if the flight crew modifies the runway end, and the selected BTV exit is beyond the modified runway end.
	The selected BTV exit is accessible.

L12

Ident.: DSC-34-32-30-20-60-10-00019531.0002001 / 27 FEB 17

ROT INFORMATION

Indicates the Runway Occupancy Time (ROT) in seconds.

Appears when all of the following occur:
- The selected BTV exit is accessible
- The LDG PERF CODE 6 (dry) or 5 (wet) is selected.

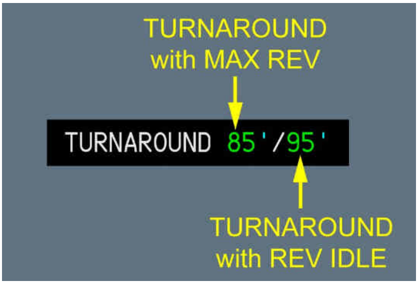
L2 The ROT is the estimated time interval between the moment the aircraft overflies the runway threshold and the moment the aircraft vacates the runway.

Ident.: DSC-34-32-30-20-60-10-00019532.0006001 / 27 FEB 17

TURNAROUND INFORMATION

Indicates the estimated number of minutes necessary for the brakes to reach 150 °C after landing. The flight crew can consider the TURNAROUND information to select the appropriate exit.

L2 The computation takes into account all of the following:
- Use of the brake fans ✻
- The brake energy necessary to reach the selected BTV exit
- A predefined taxi phase, that is independent from the selected airport and the selected exit.



L1 Appears when all of the following occur:
- The selected BTV exit is accessible
- The LDG PERF CODE 6 (dry) or 5 (wet) is selected.

Note: *Dashes can be displayed instead of the numeric values to indicate that the braking energy is too high, and the tires will deflate.*

Ident.: DSC-34-32-30-20-60-10-00019902.0002001 / 27 FEB 17

BTV MESSAGES

FOR BTV : DISARM BRK MED

ashes in reverse video when the flight crew cks on an exit, and BRK MED is armed.

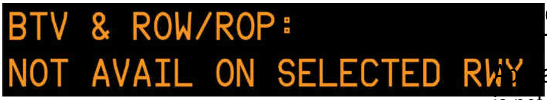
BTV/LDG RWY DISAGREE

The detected landing runway is different from the BTV landing runway.
The A/BRK mode reverts to BRK MED.
The message also appears in ARC and ROSE-NAV modes.

LDG/FMS RWY DISAGREE

- The selected landing runway is not the FMS runway
- The BTV is not armed.

L12



BTV & ROW/ROP:
NOT AVAIL ON SELECTED RWY

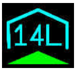
elected landing runway is not available V and ROW/ROP.
ars when the selected landing runway is not valid for ROW/ROP in the TAWS database.

Ident.: DSC-34-32-30-20-60-10-00016978.0001001 / 26 APR 14

RUNWAY

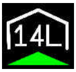
- The blue color indicates the selected landing runway
- The green triangle indicates the FMS runway.

L12



The runway 14L is the selected landing runway, and the FMS runway.
By default, the selected landing runway is the FMS runway.

The runway 14L is the selected landing runway, but not the FMS runway.

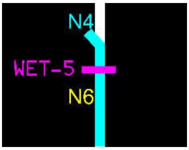


The runway 14L is the FMS runway, but not the selected landing runway.

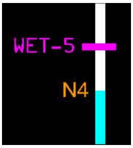
Ident.: DSC-34-32-30-20-60-10-00016979.0001001 / 06 AUG 14

ROW LINES OR STOP BAR

ROW LINES



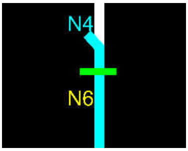
- The label indicates the selected runway condition
- The selected BTV exit is accessible
- The aircraft is in flight.



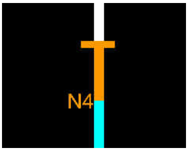
- The label indicates the selected runway condition
- The selected BTV exit will be missed
- The aircraft is in flight
- The ROW is not active.

L2 For more information about ROW lines, *Refer to DSC-34-32-20-20-50 ROW Lines or Stop Bar*.

L1 STOP BAR



- The selected BTV exit is accessible
- The BTV is active
- The aircraft is on ground.



- The selected BTV exit will be missed
- The BTV is active
- The aircraft is on ground
- The ROP is not active.

L2 For more information about the stop bars, *Refer to DSC-34-32-20-20-50 ROW Lines or Stop Bar*.

Ident.: DSC-34-32-30-20-60-10-00019980.0001001 / 09 MAR 16

BTV EXIT AT ENTRY FIELD

The flight crew can create and select a BTV exit via the distance of the exit from the threshold or modified threshold.

L2 Appears in feet (ft) with the length US unit option.

Ident.: DSC-34-32-30-20-60-10-00020001.0001001 / 06 AUG 14

SET BTV EXIT ITEM

The SET BTV EXIT item is available in PLAN mode, when the flight crew clicks on an exit of the selected landing runway. The flight crew uses the SET BTV EXIT item to select an exit that will be the target for the BTV.
After the selection, information related to the exit is displayed on the BTV information area.
When BTV is armed, the flight crew can use the SET BTV EXIT item to set BTV on another exit while BTV remains armed.

Note: *When BTV is armed, the END label is not displayed. The flight crew must disarm BTV in order to set the runway end as the BTV exit.*

Ident.: DSC-34-32-30-20-60-10-00020002.0001001 / 26 APR 14

DECLUTTER RWY ITEM

In order to help the flight crew to select an exit for BTV, and to read the map, some symbols that are not related to the selected runway are displayed in grey and become not interactive.
When the DECLUTTER RWY is active, the DISPLAY ALL function is available in the interactive menu. When clicked, all the hidden symbols appear on the map.

Ident.: DSC-34-32-30-20-60-10-00023856.0001001 / 07 NOV 16

ARROW

A blue arrow is displayed on the selected landing runway, next to the threshold.
If the flight crew inserts a threshold shift, the blue arrow also shifts in order to remain next to the threshold.

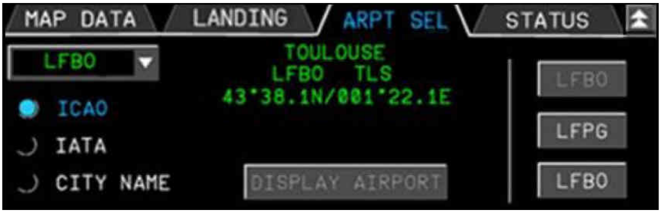
LDG RWY NOT AVAILABLE IN THE ANF DATABASE

Ident.: DSC-34-32-35-00024247.0001001 / 02 MAY 17
Applicable to: ALL

The landing runway may not be available in the ANF database for several reasons:

- The database does not contain the destination airport, or
- The map of the destination airport does not contain the landing runway (e.g. a military runway), or
- The ANF is failed or not available.

The flight crew can check any airport map available in the database via the ARPT SEL panel of the ANF.



CONSEQUENCES ON THE ANF DISPLAY

Depending on the missing data, one of the following can be displayed on the ANF:

- If the database does not contain the destination airport, the message <AIRPORT_ICAO> NOT IN DATABASE (where <AIRPORT_ICAO> is replaced by the airport ICAO code, e.g. LFBO) is displayed in the top right of the ND instead of the airport name.
  The airport moving map is not available
- If the map of the destination airport does not contain the landing runway, the airport moving map is incomplete but remains available
- If the ANF is failed or not available, the ARPT NAV NOT AVAIL message is displayed on the center of the ANF. In some cases, the following ECAM alert is triggered: NAV CAPT(FO)(CAPT +FO) ARPT NAV FAULT.

CONSEQUENCES ON ROW/ROP

The flight crew can select the runway condition/braking action via the knob-selector on the BRAKE panel only. The backup selection from the LANDING panel of the ANF is not available.
In the case of a NOTAM that changes the landing distance available, the flight crew cannot enter the shift in the airport map. As a consequence, the ROW/ROP alerts may not protect the aircraft against a runway overrun.
Above the ROW transition altitude, the ROW cannot predict a runway overrun. The associated message is not displayed. The ROW line is not displayed.

Below the ROW transition altitude, the ROW can be armed when the TAWS detects the landing runway. ROW alerts may be triggered. The ROW line is not displayed.
On ground, ROP alerts may be triggered when the TAWS detects the landing runway.

CONSEQUENCES ON BTV

It is not possible to select an exit on the airport map, the flight crew cannot arm BTV. The basic autobrake (BRK MED) can be used.

LANDING DIST AFFECTED

Ident.: DSC-34-32-35-00023432.0001001 / 27 FEB 17
Applicable to: ALL

LANDING DIST AFFECTED

SYSTEM BEHAVIOR

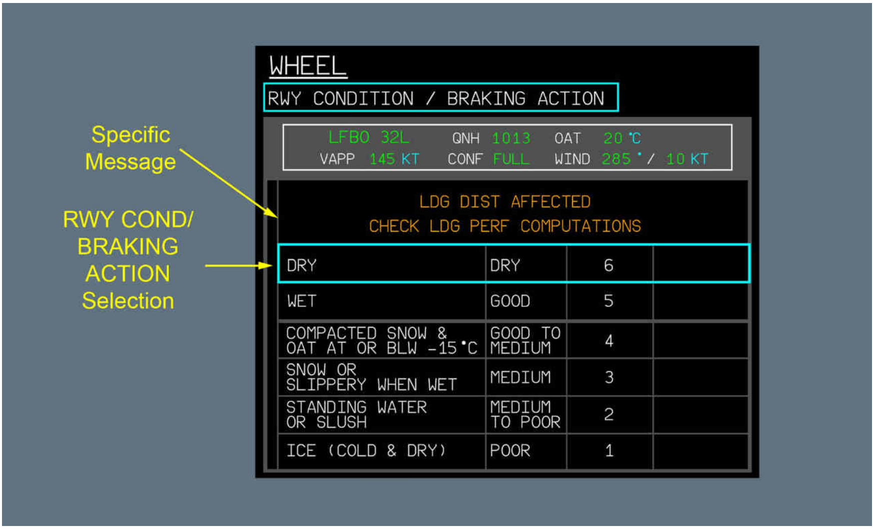
When a failure affects the landing distance, the ECAM displays LDG DIST AFFECTED or LDG PERF AFFECTED. In this case, BTV is inoperative and ROW/ROP alerts may be triggered based on a computation without failure.

CONTROLS

The flight crew cannot set a BTV exit, BRK MED remains available.
The flight crew must select the appropriate RWY CONDITION / BRAKING ACTION, as it is used to trigger ROW/ROP alerts, even if the landing distance computation does not take into account the failure that affects the landing performance.

INDICATORS

On the ANF, the ROW lines are not displayed.
On the RWY CONDITION/BRAKING ACTION matrix, a dedicated message LDG DIST AFFECTED CHECK LDG PERF COMPUTATIONS is displayed.
The indication of the TOO SHORT SELECTION is not displayed.
When selected, the runway condition appears in white instead of green, in order to indicate that the associated landing distance cannot be computed.



WHEEL

RWY CONDITION / BRAKING ACTION

INVALID RWY IN THE TAWS DATABASE

Applicable to: ALL

Ident.: DSC-34-32-35-TAWS-00024095.0001001 / 07 MAY 18

SYSTEM BEHAVIOR

A runway that is in the TAWS database can be tagged as valid, or invalid for ROW/ROP. If the flight crew selects a runway that is tagged invalid, ROW/ROP and BTV are not available.
Then, if the flight crew selects a valid runway, the BTV and ROW/ROP functions are recovered.

Ident.: DSC-34-32-35-TAWS-00024094.0001001 / 27 FEB 17

CONTROLS

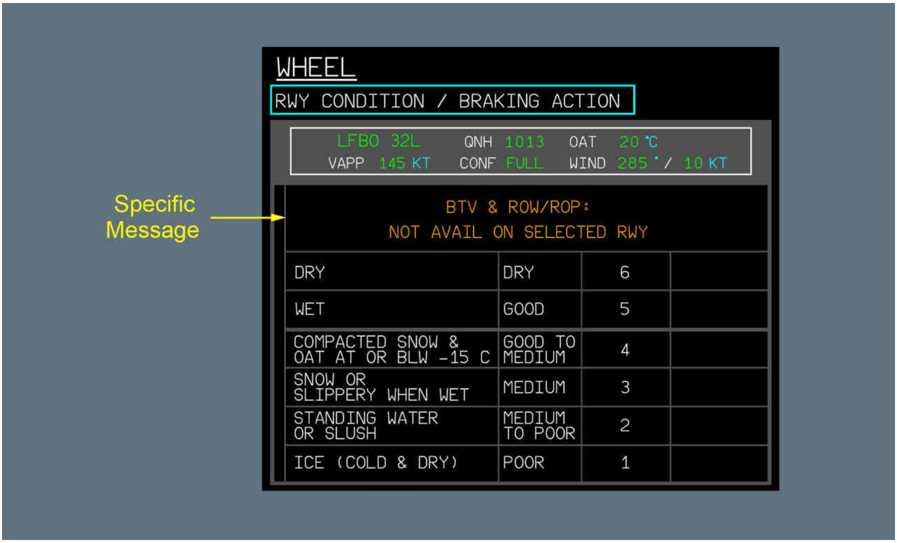
The flight crew cannot select a runway condition.
The flight crew cannot set a BTV exit, BRK MED remains available.

Ident.: DSC-34-32-35-TAWS-00023433.0001001 / 27 FEB 17

INDICATORS

On the ANF:
- The ROW lines are not displayed,
- In PLAN mode, the message BTV & ROW/ROP: NOT AVAIL ON SELECTED RWY is displayed,
- In other ND modes, the message UNKNOWN SELECTED RWY is displayed.

On the RWY COND/BRK ACTION matrix the message BTV & ROW/ROP: NOT AVAIL ON SELECTED RWY is displayed.



Specific Message

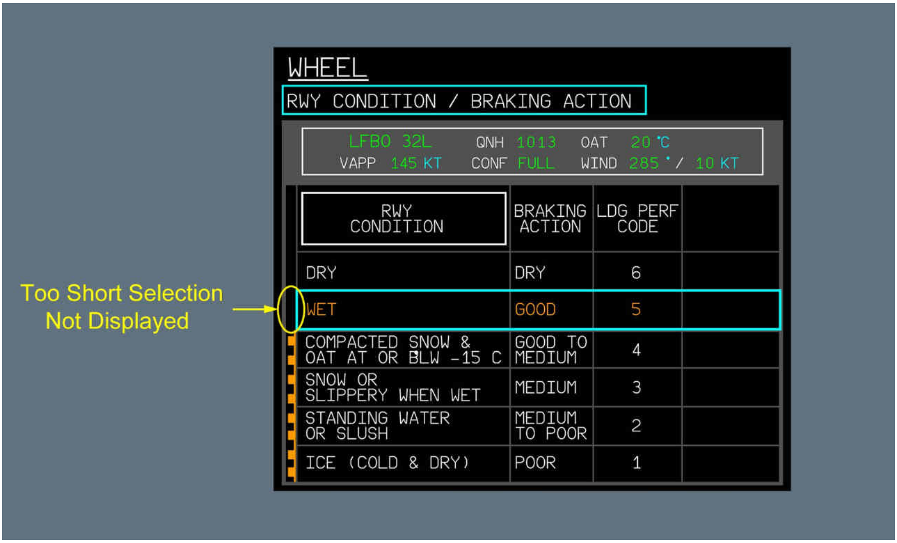
"TOO SHORT SELECTION" INDICATION NOT DISPLAYED ON THE RWY CONDITION / BRAKING ACTION MATRIX FOR LDG PERF CODE 5 (WET - GOOD)

Ident.: DSC-34-32-40-00025462.0003001 / 03 APR 20
Applicable to: ET-AYA

DESCRIPTION

On the RWY CONDITION / BRAKING ACTION matrix, the “Too Short Selection” indication (amber and black barber pole) may not appear in front of the WET / GOOD line when the runway is too short.



Too Short Selection
Not Displayed

WHEEL

RWY CONDITION / BRAKING ACTION

LFBO 32L QNH 1013 OAT 20 °C
VAPP 145 KT CONF FULL WIND 285 ° / 10 KT

RWY CONDITION	BRAKING ACTION	LDG PERF CODE
DRY	DRY	6
WET	GOOD	5
COMPACTED SNOW & OAT AT OR BLW -15 C	GOOD TO MEDIUM	4
SNOW OR SLIPPERY WHEN WET	MEDIUM	3
STANDING WATER OR SLUSH	MEDIUM TO POOR	2
ICE (COLD & DRY)	POOR	1

All the other indications are correct, particularly:

- On the RWY CONDITION / BRAKING ACTION matrix, the WET / GOOD line appears in amber when selected
- On the ND:
  - The Landing Runway, LDA, and RWY COND / BRAKING ACTION (WET-5 or GOOD-5) appear in amber
  - The TOO SHORT message appears in amber.

In addition, ROW/ROP and BTV are not affected.

OPERATIONAL RECOMMENDATION

Do not assess the capability to land on a runway with a LDG PERF CODE 5 (WET - GOOD) on the “Too Short Selection” indication in front of the WET / GOOD line on the RWY CONDITION / BRAKING ACTION matrix.

OVERVIEW

Ident.: DSC-35-10-00003085.0001001 / 29 APR 14
Applicable to: ALL

The oxygen system is designed to supply oxygen to the flight crew, cabin crew and passengers, in the case of smoke, fire, noxious gas emissions, or cabin depressurization.

The oxygen system has a:
- Fixed oxygen system in the cockpit
- Fixed oxygen system in the cabin (for cabin crew and passengers)
- Portable oxygen system for the cockpit and the cabin.

Intentionally left blank

FIXED OXYGEN SYSTEM FOR COCKPIT

Ident.: DSC-35-20-10-00003086.0001001 / 29 APR 14
Applicable to: ALL

The fixed oxygen system is separated into two sub-systems:

- One sub-system supplies oxygen to the left side of the cockpit (captain and 4th occupant)
- One sub-system supplies oxygen to the right side of the cockpit (first officer and 3rd occupant).

The fixed oxygen system in the cockpit has:

- 4 full-face quick-donning masks.
  Each mask is stowed in its own stowage box.
  Each stowage box is next to each flight crew station (*Refer to DSC-35-20-20 Cockpit View*).
  Each mask contains microphones for cockpit communication.
- Two oxygen bottles (or four, as installed)
- Two supply valves.
  These valves are normally open. The flight crew can manually close the valves to stop oxygen supply, by using the CREW SUPPLY pb-sw that is on the OXYGEN overhead panel.
- L3 Two redundant OXY CTL SYS, hosted in IMA CPIOM H33 and H34 (For more information on CPIOM, *Refer to DSC-42-10 CPIOM*). They monitor and control the cockpit and cabin oxygen system.
- L1 Two overboard discharge indicators.
  These indicators are located on each front side of the aircraft. They are normally green. An indicator turns yellow, if there is any overpressure in the oxygen system.

CAPT AND F/O INDICATIONS

CAPT F/O Normal operation of the oxygen system.

L12

CAPT F/O

- The oxygen system is off (the CREW SUPPLY pb-sw is OFF)
  The REGUL PR LO indication also appears.
  Or
- The oxygen system has low pressure.

If the oxygen system has low pressure, the CAPT (F/O) indication appears with:

- The REGUL PR LO indication, on ground, if there is a low pressure in the distribution manifold
- The oxygen pressure value in amber, because low pressure is detected in the oxygen bottle.
  Associated with the following ECAM alert: OXY CAPT (F/O) BOTTLE PRESS LO (*Refer to procedure*).

Ident.: DSC-35-20-20-D-00003101.0001001 / 03 DEC 18

OXYGEN PRESSURE VALUE

When the value is displayed in green, the pressure is equal to, or above 350 PSI.

On ground only: when the value is green with the amber half-frame, the pressure is below 1 150 PSI.

L12

The value is amber, when a low pressure is detected in the oxygen bottle. This occurs, when the pressure is below 350 PSI.
Associated with the following ECAM alert: OXY CAPT (F/O) BOTTLE PRESS LO (*Refer to procedure*)

L3 Note: *The oxygen pressure is temperature compensated. A temperature sensor, located next to the oxygen bottle, measures the temperature in the area.*

Ident.: DSC-35-20-20-D-00003102.0001001 / 02 MAY 14

REGUL PR LO INDICATION

L13

Appears on ground, when:
- The oxygen CREW SUPPLY pb-sw is OFF, or
- The oxygen pressure in the oxygen distribution manifold is low. Oxygen pressure is low, if it goes below 47 PSI.

FLIGHT CREW OXYGEN MASK

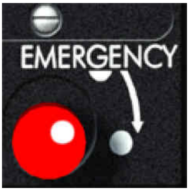
- When the red grips are pressed together, the harness inflates.
- When the red grips are released, the harness deflates.

Ident.: DSC-35-20-20-C-00022109.0001001 / 06 NOV 14

EMERGENCY selector

The EMERGENCY selector provides overpressure, if necessary (e.g. to prevent smoke, smell, or ashes from entering the mask, or to remove condensation).



- When pressed, and until released, supplies oxygen overpressure
- When turned, permanently supplies oxygen overpressure.

Note: *If the cabin altitude is above 30 000 ft, oxygen overpressure is automatically supplied.*

Ident.: DSC-35-20-20-C-00022110.0001001 / 05 NOV 15

N/100% selector

The N/100% selector has two positions:

PRESS
TO
TEST
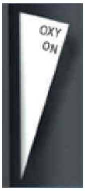
AND
RESET

When pressed, the PRESS TO TEST AND RESET pb either tests, or resets, the oxygen system:

- If the mask has not been taken out of the stowage box (OXY ON flag not visible), this pushbutton tests the oxygen system.
  When the system is operating correctly, the oxygen flow indicator will be yellow for a few seconds.
- If the mask has been taken out of the stowage box and restowed (OXY ON flag visible), this pushbutton resets the oxygen system. Therefore:
  - The oxygen supply to the mask is cut off
  - The mask microphone is deactivated
  - The OXY ON flag disappears.

Ident.: DSC-35-20-20-B-00003095.0002001 / 06 NOV 14

OXY ON FLAG



Appears, after the mask is pulled out of its stowage box, and the left door of the stowage box is closed again. Oxygen flows to the mask.

HOW TO TEST THE MASK

Ident.: DSC-35-20-40-00011719.0002001 / 06 NOV 14
Applicable to: ALL

WARNING	To prevent hearing damage to the ground crew connected to the intercom system, inform them that a loud noise may be heard in the headset when performing the oxygen mask test.

- **On the Oxygen Panel:**
  CREW SUPPLY pb-sw .... CHECK ON
- **On the glareshield:**
  LOUDSPEAKERS........ CHECK ON
- **On the RMP:**
  INT reception knob .... PRESS OUT - ADJUST
  INT/RAD sw .... INT
- **On the mask stowage box:**
  Mask stowage box: *Refer to Illustration*

  PRESS TO TEST AND RESET pb .... PRESS AND HOLD

  Check that the oxygen flow indicator turns yellow for a short time, and then goes black.

  Hold the PRESS TO TEST AND RESET pb down, and press the EMERGENCY selector.

  Check that the oxygen flow indicator turns yellow, and remains yellow, as long as the EMERGENCY selector is pressed.
  Listen for oxygen flow through the loudspeakers.

  Check that the PRESS TO TEST AND RESET pb returns to the up position.

  Check that the N/100% selector is in the 100% position.

  Press the EMERGENCY selector again.

  Check that the oxygen flow indicator remains black. This ensures that the mask is not supplied with oxygen.

HOW TO DON THE MASK

Ident.: DSC-35-20-40-00003104.0001001 / 06 NOV 14
Applicable to: ALL

STEP 1

Turn toward the lateral console.

STEP 2

Remove the mask from its stowage box, by squeezing the red grips toward each other, and pulling the mask out of its box.

The stowage box opens, and the:
- Mask is immediately supplied with oxygen
- Mask harness immediately inflates
- Mask microphone is active.

CAUTION	CM1 and CM2 must remain turned toward their respective lateral windows, until they have donned their mask.

STEP 3

Don the mask.

STEP 4

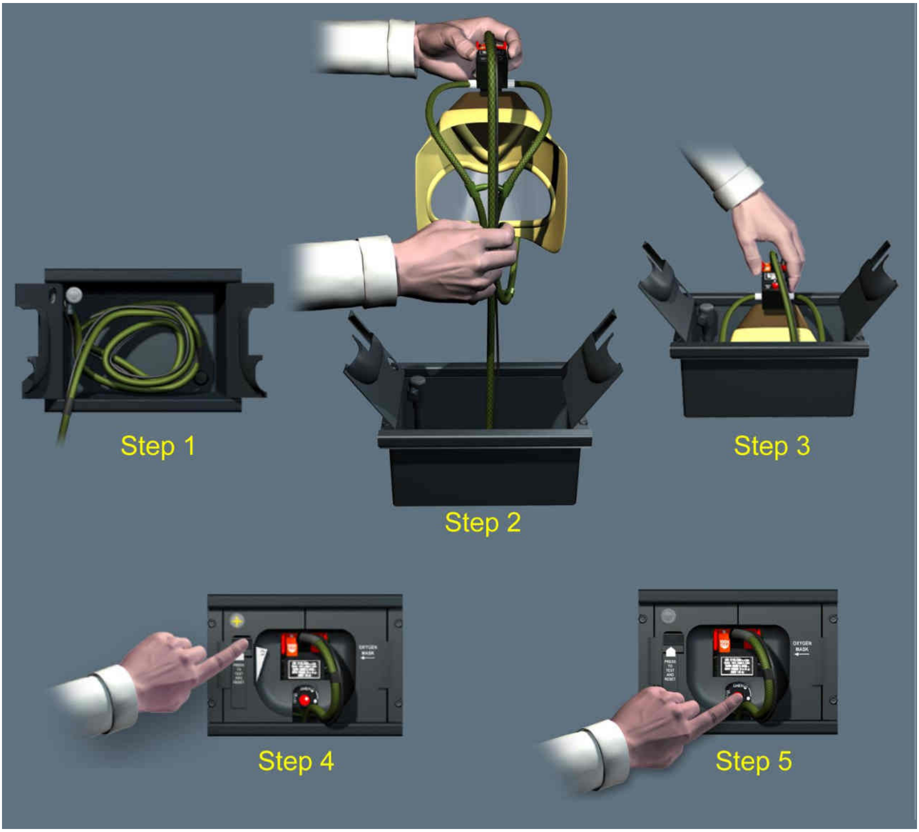
Release the red grips. This will deflate the mask harness, and keep the mask in position.

Note: *The visor of each mask may have a protective film to help prevent scratches. This film is optional, and can be removed at any time.*

HOW TO STOW THE MASK

Ident.: DSC-35-20-40-00003105.0002001 / 06 MAR 15
Applicable to: ALL

How to stow the mask



STEP 1

Coil the hose that is connected to the mask, and put it in the bottom of the stowage box.

STEP 2

Hold the mask by the regulator, and pull the inflatable harness downward with care.

Note: *Ensure that the harness is not inside the mask.*

STEP 3

Put the mask in the stowage box.

Make sure that the:
- Mask touches the bottom of the stowage box
- N/100% selector is face up, and at the 100% position.

STEP 4

Close the doors of the mask stowage box.
Firmly press the PRESS TO TEST AND RESET pb.
When released, check that the OXY ON flag disappears.

STEP 5

Press the EMERGENCY selector, and check that the oxygen flow indicator remains black.

CAUTION	Maintaining the EMERGENCY selector in the EMERGENCY position can deplete the crew oxygen cylinder.

FIXED OXYGEN SYSTEM FOR THE CABIN

Ident.: DSC-35-30-10-00003107.0002001 / 05 NOV 18
Applicable to: ALL

The fixed oxygen system for the cabin provides oxygen to the cabin (passengers and cabin crew), and to the crew rest compartments for a minimum of 22 min, or 15 min ◁✱ .

The fixed oxygen system of the cabin has:
- Chemical generators
- Gaseous oxygen cylinders (only in lavatories)
- Masks (stowed in containers)
- L3 Two redundant OXY CTL SYS, hosted in IMA CPIOM H33 and H34 (For more information on CPIOM, *Refer to DSC-42-10 CPIOM*). They monitor and control the cockpit and cabin oxygen system.

L1 The containers are located above the passenger seats, in each lavatory, in each galley, at each cabin crew station, and in each crew rest compartment.

The containers automatically open to release the masks, when:
- The cabin altitude is above 13 800 ft
- The flight crew opens the MASK MAN ON pb guard, and presses the pushbutton.

L2 When a passenger or a cabin crew pulls one mask, the oxygen is supplied for a minimum of 22 min (or 15 min ◁✱) to all masks connected to the same generator/cylinder.
L3 Once activated the system cannot be turned off. The oxygen flows until the oxygen generator/cylinder is empty.

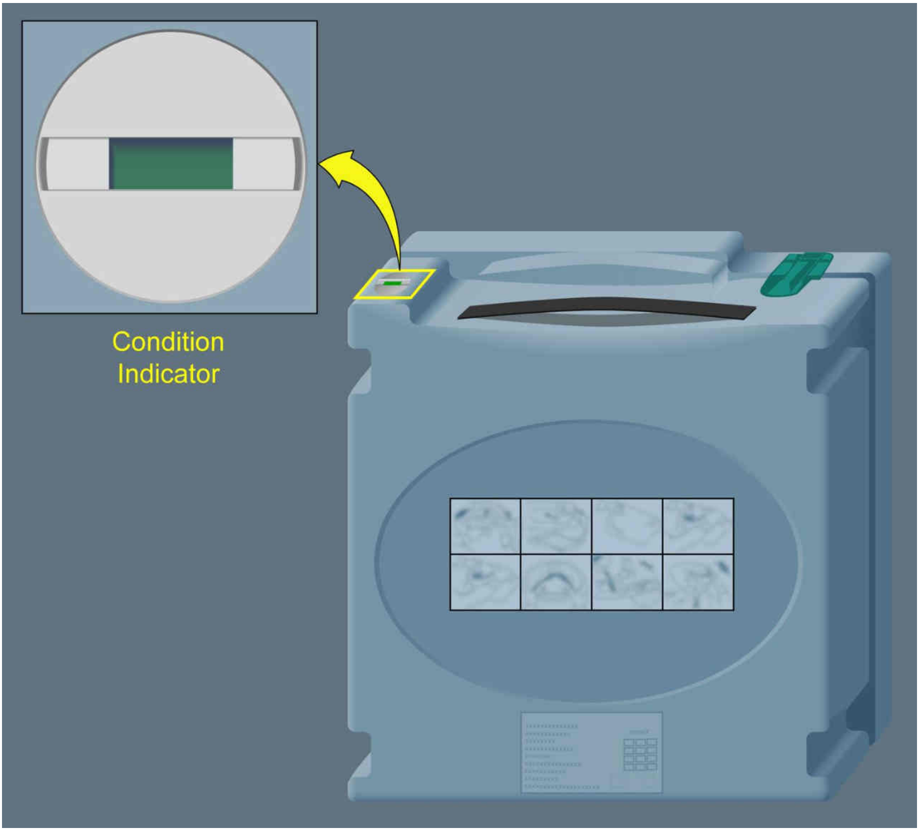
PROTECTIVE BREATHING EQUIPMENT (PBE)

Ident.: DSC-35-40-10-00003123.0001001 / 08 JUL 19
Applicable to: ALL

There is one Protective Breathing Equipment (PBE) in the cockpit. The PBE is a hood, contained in a stowage box.

The PBE can be used in the case of smoke, fire, toxic gases. It:
- Protects the user's eyes and respiratory system for 15 min
- Protects against hypoxia up to a cabin altitude of 25 000 ft. However, the flight crew must not don the PBE when the cabin depressurization begins. In this case the flight crew must use the fixed oxygen mask (*Refer to DSC-35-20-40 How to Don the Mask*)
- L2 Enables the user to leave the station or cockpit
- Enables the user to communicate, via a phonic membrane.

It is possible to remove the hood from its stowage box, and to don it in less than 10 s.
It can be donned, even if the user has long hair, a beard, or glasses.
L3 There is a carbon dioxide absorption system in the hood, and the visor is treated against fog.
L1 The hood is stowed in a stowage box. For location in the cockpit: *Refer to DSC-25-20 Cockpit Emergency Equipment*.
The stowage box has a condition indicator.



L2 If the PBE is in good condition, the indicator is green. If there is a leak, the condition indicator becomes red, and indicates that the PBE may not provide up to 15 min of protection.

PORTABLE OXYGEN CYLINDER

Ident.: DSC-35-40-10-00011774.0001001 / 29 APR 14
Applicable to: ALL

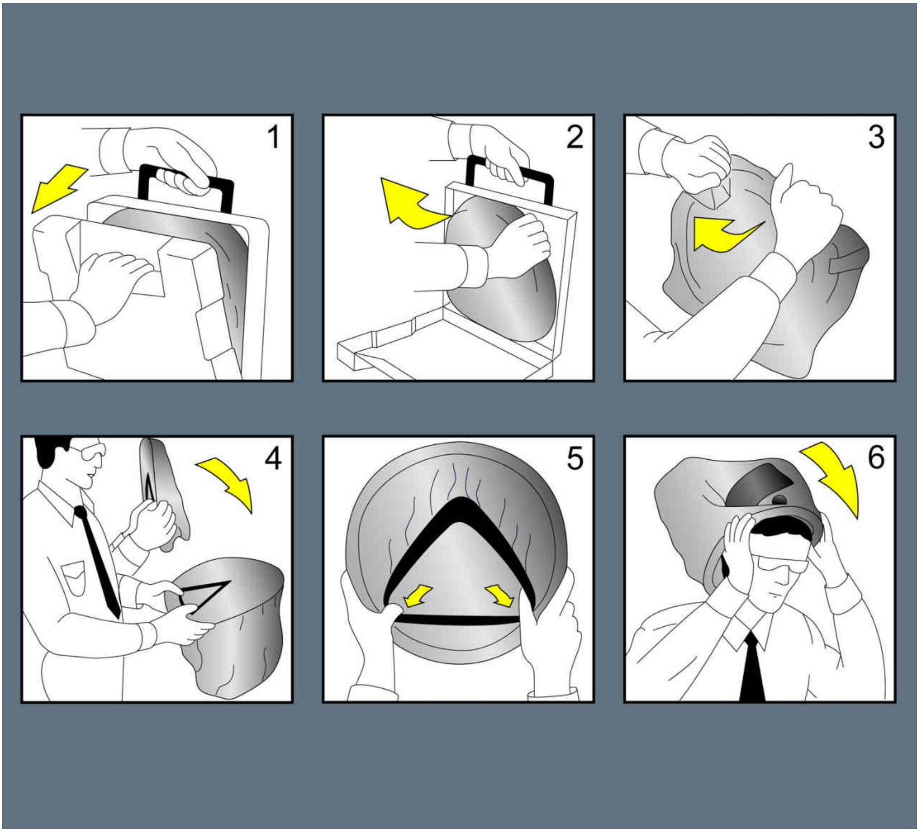
For more information on the Portable Oxygen Cylinder located in the cabin, *Refer to CCOM/Portable Oxygen*.

Intentionally left blank

HOW TO DON THE PBE

Ident.: DSC-35-40-20-00003124.0001001 / 29 APR 14
Applicable to: ALL

How to don the PBE



1. Check that the condition indicator is green.
   With one hand, hold the handle that has the "1 LIFT" label. With the other hand, pull sharply the grey part that has the "2 PULL" label. This action enables to break the protective seal, and open the cover.
2. Hold the vacuum bag with one hand, and take it out of the case by pulling it toward you.
3. Hold the vacuum bag with one hand, and pull one of the tear-off strips with the other hand. Take the hood out of the bag.

4. Hold the hood with both hands with the thumbs inside the neck seal. Shake the hood downward in one movement.
5. Put the thumbs on the orange marks, and open the neck seal.
6. Pass the hood over your head, starting from the back.
   The user hears a slight click: The hood is now operational for at least 15 min. Breathe normally.

WARNING	Put the hair above the neck seal inside the hood. Do not damage the neck seal when putting on the PBE. Be especially careful with glasses, sharp-edged necklaces and earrings.

During the 15 min of operation, the temperature increases, and reaches 40 °C at the end of operation. When the noise of oxygen flow stops, the hood is no longer operational. The user must remove the hood: *Refer to DSC-35-40-20 How to Put off the PBE*.

HOW TO PUT OFF THE PBE

Ident.: DSC-35-40-20-00003125.0001001 / 29 APR 14
Applicable to: ALL

1. Go to a safe area, away from fire, flame, and toxic fumes.
2. Put both thumbs inside the neck seal, at the front of the hood.
3. Take hold of the oxygen container, through the fabric.
4. Pull the hood backward.
5. Put the hood in a dry, fire protected place, and away from any source of heat, sunlight or corrosive fluid.

OVERVIEW

Ident.: DSC-36-10-10-00003040.0001001 / 23 APR 14
Applicable to: ALL

The Bleed Air System (BAS) supplies high-pressure air to the following systems:
- Air conditioning and cabin pressurization
- Fuel tank inerting

L2 For more information on the FTIS, *Refer to DSC-28-10 Fuel Tank Inerting System*.

L1
- Wing anti-ice
- Engine start
- Pack bay ventilation.

High Pressure (HP) air is supplied by:
- The engines
- The APU
- Ground-air sources, through two HP ground connectors.

There is one crossbleed valve on the crossbleed duct.

The crossbleed valve:
- Ensures that bleed air is supplied to the systems, depending on which bleed air sources are available, and
- Permits to isolate the left and right sides of the bleed air system when required.

A leak detection system detects any overheat near the bleed ducts. For more information, *Refer to DSC-36-10-60 Leak Detection*.

In normal conditions, the bleed air system operates automatically.

L3 During takeoff phase, the positions of all valves which belong to the BAS are frozen.

L1 If necessary, the pilot can manually operate the bleed air system.

L3 The BAS applications of CPIOMs H43 and H44:
- Control and monitor the bleed air system. For that purpose, each BAS application is dedicated to one engine bleed air system.
- Ensure the automatic control of the crossbleed valve. For that purpose, only one BAS application is used at a time.

In addition, two Bleed and Overheat Monitoring Units (BOMUs):
- Also control and monitor the bleed air system. For that purpose, each BOMU is dedicated to one engine bleed air system.
- Perform the bleed leak detection. For that purpose the two BOMUs are redundant.

ENGINE BLEED AIR SUPPLY

L2 Engine bleed air usually comes from the Intermediate Pressure (IP) compressor of the engine. The pressure of the IP compressor is sufficiently high to supply pressurized air to the system users, except at low thrust settings. Using air from the IP compressor minimizes fuel consumption.

L1 At low engine thrust settings, the air pressure is too low, and air is bled from the High Pressure (HP) compressor of the engine, through the HP valve.
The HP valve automatically controls and regulates the pressure of the air supply.
L3 In normal operation, the HP valve is electronically controlled and limits the downstream bleed pressure to 50 PSI.
In degraded mode, the HP valve operates in pneumatic mode and regulates the downstream bleed pressure at about 67.5 ± 12.5 PSI.

L1 The HP valve automatically closes in any one of the following cases:
- When the bleed pressure of the IP compressor is sufficiently high
L3 When the pressure is more than 35 PSI.
L1 - When the bleed pressure of the HP compressor is too low (e.g. at engine start)
L3 When the pressure is less than 15 PSI.
L1 - When the engine bleed valve is commanded to close
- In the case of bleed overtemperature

L3 The temperature downstream of the engine bleed valve exceeds:
  - 257 °C during more than 55 s, or
  - 270 °C during more than 15 s, or
  - 287 °C during more than 5 s.

L1 - In case of bleed overpressure

L3 The pressure downstream of the engine bleed valve exceeds:
  - 58 PSI when the valve is electronically controlled, or
  - 73 PSI when the valve is operated in pneumatic mode.

L1 - To protect the system from an engine-to-engine reverse flow, at low engine thrust settings, with the crossbleed valve in the open position.

L3 When the HP valve is open, a pressure non-return valve prevents air from the HP stage of the compressor from circulating to the IP stage. This non-return valve is mounted downstream of the IP stage of the compressor.

Ident.: DSC-36-10-20-10-00003043.0001001 / 02 APR 15

PRESSURE REGULATION

For each engine, the engine bleed valve regulates the delivered bleed pressure. This valve can also close, and isolate its applicable engine bleed air system.
L3 The engine bleed valve is located downstream of the IP and HP bleed junction.
L2 In normal operation, the engine bleed valve is electronically controlled and maintains the precooler outlet pressure between 37 and 53 PSI.
In degraded mode, the engine bleed valve operates in pneumatic mode and regulates the bleed precooler outlet pressure at about 60 ± 10 PSI.

L1 ENGINE BLEED VALVE OPERATION

Each engine bleed valve automatically operates, when its associated engine is running.
Both engine bleed valves automatically close, when the APU BLEED pb-sw is set to ON.
If necessary, the flight crew can manually close each engine bleed valve by setting the assigned ENG BLEED pb-sw to OFF.
The engine bleed valve closes, when the ENG FIRE pb-sw of the associated engine is pressed.

L2 Automatic Opening

The engine bleed valve automatically opens when the associated engine bleed is available.
The engine bleed valve then regulates the engine bleed air pressure.
L3 The valve opens when the upstream pressure is more than 15 PSI.

L2 Automatic Closure

The engine bleed valve automatically closes:

- During the start sequence of the associated engine
  L3 It opens again when the engine start valve closes, and the upstream pressure is more than 15 PSI .
- L2 In the case of malfunctions in the associated engine bleed air system:
  - Bleed overpressure

    L3 The pressure downstream of the engine bleed valve exceeds:
    - ■ 58 PSI when the valve is electronically controlled, or
    - ■ 73 PSI when the valve is operated in pneumatic mode.
  - L2 Bleed overtemperature

    L3 The temperature downstream of the engine bleed valve exceeds:
    - ■ 257 °C during more than 55 s, or
    - ■ 270 °C during more than 15 s, or
    - ■ 287 °C during more than 5 s.
- L2 In the case of malfunctions in the onside Wing Ice Protection System (WIPS)
- In the case of a leak detection in the surrounding area
  L3 A leak is detected in the APU duct (engine 1 bleed valve only), or in the associated engine or wing bleed duct.
- L2 In the case of a smoke procedure
- In the case the crossbleed valve is failed in the open position
- In the case the XBLEED selector is set to OPEN, and the wing anti-ice is set to ON
- To protect the system from an engine-to-engine reverse flow, at low engine thrust settings, with the crossbleed valve in the open position.

L3 OVERPRESSURE VALVE

In addition, an overpressure valve protects the bleed system.
This valve automatically closes, in addition to the associated engine bleed valve, when the ENG FIRE pb-sw is pressed or when an overtemperature, an overpressure or a leak in the surrounding area is detected. The overpressure valve also closes in the case of a smoke procedure.
In the case of total loss of pressure regulation control, the overpressure valve automatically regulates the bleed pressure to 90 PSI when the bleed air pressure upstream the overpressure valve is above 90 PSI.

Ident.: DSC-36-10-20-10-00003044.0001001 / 15 APR 14

TEMPERATURE REGULATION

A precooler regulates the temperature of each engine bleed.
L3 The precooler is an air-to-air heat exchanger, mounted downstream of the engine bleed valve. It uses cooling air, that is bled from the engine fan. The transferred heat is subsequently returned to the engine core and vented overboard.
A fan air valve regulates the airflow. The fan air valve closes, when there is no bleed pressure.
L2 To obtain the selected temperature in the cabin zones, the precooler regulates bleed air temperature to approximately 200 °C.
However, depending on the demand, the bleed air temperature can be regulated down to 150 °C, provided that wing anti-ice is off.

APU BLEED AIR SUPPLY

Ident.: DSC-36-10-30-00003045.0001001 / 07 NOV 16
Applicable to: ALL

The APU also provides bleed air to the bleed system, via the APU bleed valve.
L3 This valve is not a pressure-regulating valve, since the APU runs at a constant speed.

L1 The APU can supply bleed air for air conditioning and pressurization:
- On ground,
- In flight:
  - Up to 25 000 ft (7 620 m) for single pack operation
  - Up to 22 500 ft (6 858 m) for dual pack operation.

The APU can supply bleed air to assist engine start:
- On ground,
- In flight, up to 25 000 ft (7 620 m).

For more information on the APU operational envelope, *Refer to LIM-APU Operational Envelope*.
L3 A non-return valve, located near the crossbleed duct, protects the APU when air is bled from another source.

L1 APU BLEED VALVE OPERATION

When the APU BLEED pb-sw is set to ON, provided that the APU is running, and that the aircraft is at or below 25 000 ft (7 620 m):
- The APU bleed valve opens
- The crossbleed valve opens (if the XBLEED selector is set to AUTO)
- Both engine bleed valves close.

In the case of an APU bleed leak, or if the APU FIRE pb-sw is pressed, the APU bleed valve automatically closes.

Intentionally left blank

HP GROUND AIR SUPPLY

Ident.: DSC-36-10-40-00003046.0001001 / 15 APR 14
Applicable to: ALL

There are two HP ground connectors. An HP ground source can be connected to each HP ground connector, to supply bleed air to the aircraft.

L2 These HP ground connectors are on the belly fairing.

L3 Each connector has a non-return valve, that protects the connector, when air is bled from another source.

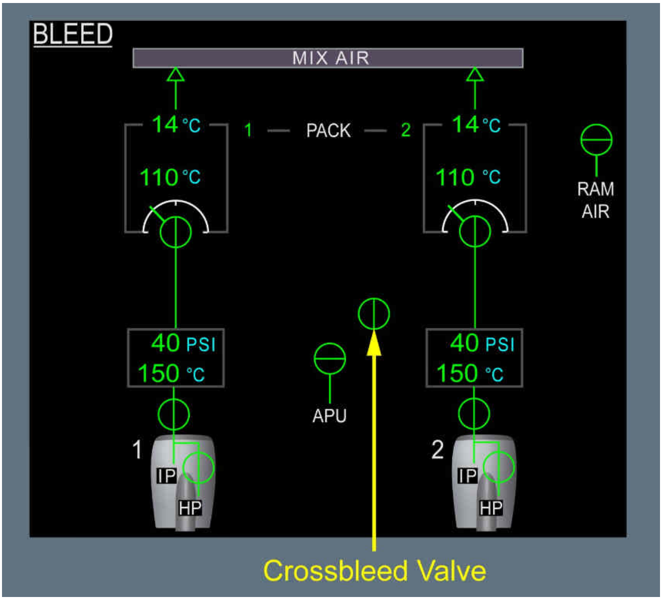
L1 When any of the HP ground sources is connected, all systems can receive bleed air.

Intentionally left blank

CROSSBLEED

Ident.: DSC-36-10-50-00003047.0001001 / 23 APR 14
Applicable to: ALL

Crossbleed Valve



A crossbleed duct interconnects the LH (engine 1) and the RH (engine 2) bleed air systems. The crossbleed valve located on this duct can isolate or interconnect the LH and RH bleed air systems. In normal operations, the XBLEED selector is set to AUTO, and the crossbleed valve operates automatically.

The crossbleed valve is normally closed. It automatically opens:
- At engine start
- On ground, when both engines and the APU are off
- On ground, when a ground source is used
- When the APU bleed valve is selected open
- In case any engine bleed air system is closed, or
- In case one pack is declared inoperative.

The crossbleed valve can be manually opened, if the XBLEED selector is set to OPEN.

In the case of a wing or APU bleed leak, the affected bleed duct is isolated, by maintaining the crossbleed valve closed. (For more information *Refer to DSC-36-10-60 Leak Detection*).

LEAK DETECTION

Applicable to: ALL

Ident.: DSC-36-10-60-10-00003048.0001001 / 15 APR 14

LEAK DETECTION

On ground and in flight, dual detection loops provide leak detection for the hot air bleed ducts of the:
- Engines
  L2 These ducts are located in the engines pylons.
- L1 Wings
- Wing anti-ice
- APU
- Fuel Tank Inerting System (FTIS)
- Pack bays
- Air conditioning hot-air system.

L2 The presence of hot air near the ducts indicates a leak in the bleed ducts.

L3 The control of the OverHeat Detection System (OHDS) function is hosted in CPIOMs H43 and H44.
Two Bleed and Overheat Monitoring Units (BOMUs) perform the bleed leak detection.
Each single loop is connected to one BOMU.
Each BOMU monitors the hot air bleed leaks detected by its connected loops.

L2 The ECAM will trigger a leak alert, in case:
- Both loops detect an ambient overheat, or
- One loop detects an ambient overheat, and the other one is inoperative.

L3 An ambient overheat is detected, when the ambient temperature near the bleed ducts is above:
- 154 °C for the engine pylon ducts
- 124 °C for all other ducts.

L1 If a leak is detected, the affected bleed duct is automatically isolated.

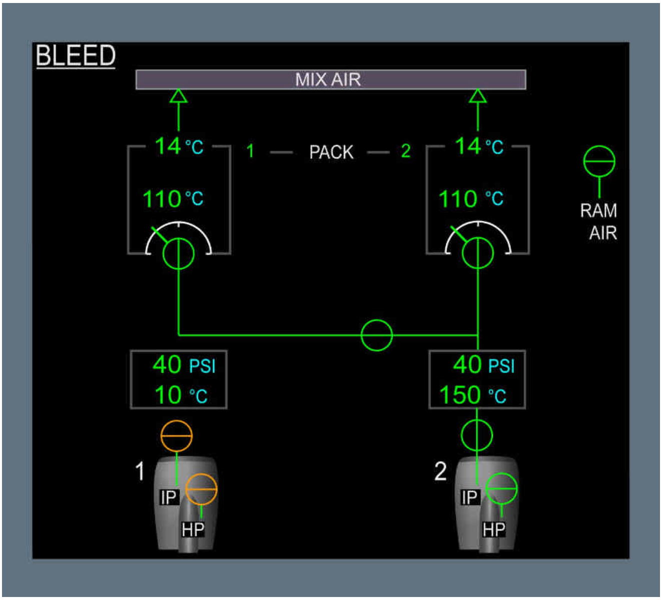
ENGINE BLEED LEAKS

When a leak is detected in an engine bleed duct, the corresponding engine bleed valve automatically closes.

L3 The corresponding engine bleed overpressure valve also automatically closes.

Engine 1 Bleed Leak



- **If a leak is detected in the engine 1 bleed duct, and the engine 1 bleed overpressure valve does not automatically close:**
  The APU bleed valve and the crossbleed valve automatically close.
- **If a leak is detected in the engine 2 bleed duct, and the engine 2 bleed overpressure valve does not automatically close:**
  The crossbleed valve automatically closes.

L2 For more information on the associated ECAM procedure: *Refer to PRO-ABN-AIR AIR ENG 1(2) BLEED LEAK*.

Ident.: DSC-36-10-60-10-00012059.0001001 / 23 APR 14

WING LEAKS

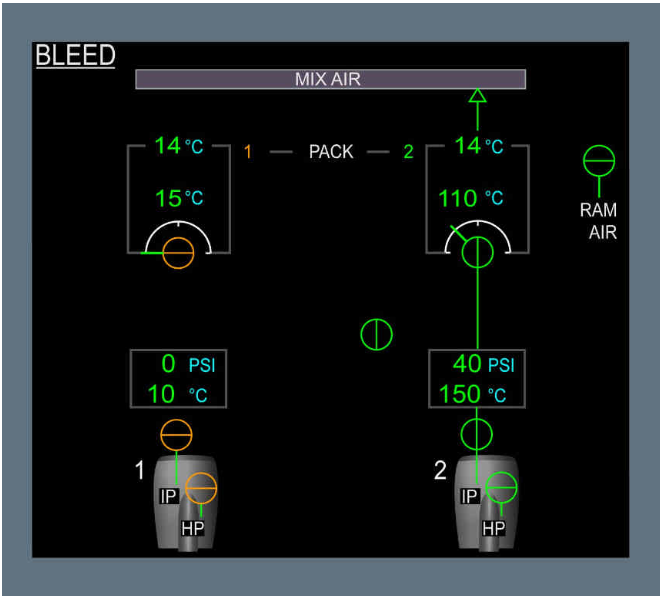
- **When a leak is detected in the left wing bleed duct:**

  The following valves automatically close:
  - The engine 1 bleed valve
  - The engine 1 bleed overpressure valve
  - The crossbleed valve
  - The APU bleed valve.

L3
L1

The APU bleed and the engine 1 bleed are no longer available.

Left Wing Leak



- **When a leak is detected in the right wing bleed duct:**

  The following valves automatically close:
  - The engine bleed 2 valve
  - L3 The engine 2 bleed overpressure valve
  - L1 The crossbleed valve.

  The engine 2 bleed is no longer available.

L2 For more information on the associated ECAM procedure: *Refer to PRO-ABN-AIR AIR L(R) WING LEAK*.

Ident.: DSC-36-10-60-10-00012061.0001001 / 23 APR 14

WING ANTI-ICE LEAKS

When a leak is detected in the left or right wing anti-ice bleed duct (downstream the wing anti-ice valve), both wing anti-ice valves automatically close. The wing anti-ice is no longer available.

L2 ■ **When a leak is detected on the left side, and if the associated wing anti-ice valve does not automatically close:**

The following valves automatically close:
- The engine 1 bleed valve
- L3 The engine 1 bleed overpressure valve
- L2 The APU bleed valve
- The crossbleed valve.

■ **When a leak is detected on the right side, and if the associated wing anti-ice valve does not automatically close:**

The following valves automatically close:
- The engine 2 bleed valve
- L3 The engine 2 bleed overpressure valve
- L2 The crossbleed valve.

For more information on the associated ECAM procedure: *Refer to PRO-ABN-AIR AIR L(R) WING A-ICE LEAK*.

Ident.: DSC-36-10-60-10-00003051.0001001 / 23 APR 14

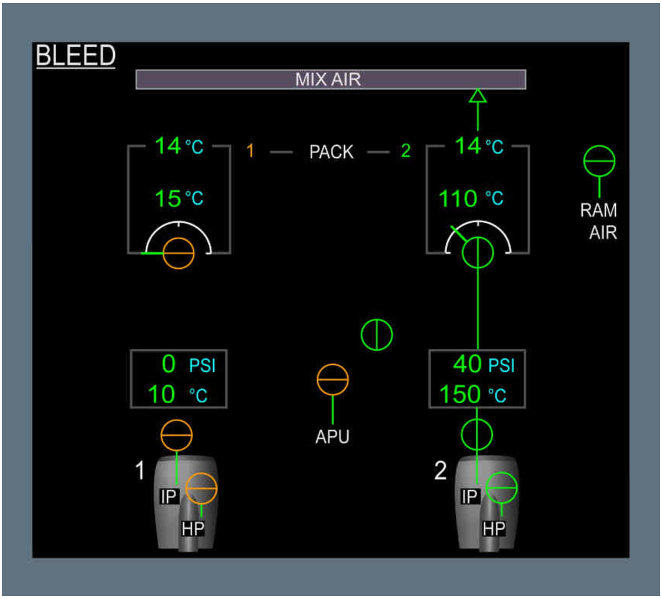
APU BLEED LEAKS

When a leak is detected in the APU bleed ducts, the following valves automatically close:

- The APU bleed valve
- The engine 1 bleed valve
- L3 The engine 1 bleed overpressure valve
- L1 The crossbleed valve.

The APU bleed and the engine 1 bleed are no longer available.

APU Bleed Leak



L2 For more information on the associated ECAM procedure: *Refer to PRO-ABN-AIR AIR APU BLEED LEAK*.

Ident.: DSC-36-10-60-10-00012062.0001001 / 23 APR 14

FUEL TANK INERTING LEAKS

When a leak is detected in the Conditioned Service Air System (CSAS), the CSAS on the affected side is automatically shut down. The FTIS is no longer available.

L2 ■ **When a leak is detected on the left side, and if the associated CSAS isolation valve does not automatically close:**

The following valves automatically close:
- The engine 1 bleed valve
- L3 The engine 1 bleed overpressure valve
- L2 The APU bleed valve
- The crossbleed valve.

■ **When a leak is detected on the right side, and if the associated CSAS isolation valve does not automatically close:**

The following valves automatically close:
- The engine 2 bleed valve
- L3 The engine 2 bleed overpressure valve
- L2 The crossbleed valve.

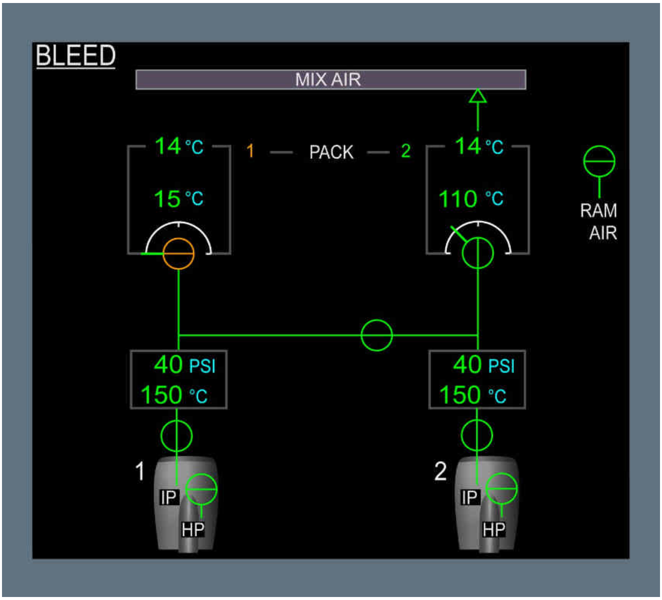
For more information on the associated ECAM procedure: *Refer to PRO-ABN-AIR AIR LEAK ON FUEL INERTING*.

Ident.: DSC-36-10-60-10-00003052.0001001 / 23 APR 14

PACK LEAKS

When a leak is detected in a pack bay area, the two pack valves of the affected pack automatically close and the CSAS on the affected side is automatically shut down. The FTIS is no longer available.

Bleed Leak on Pack 1



L2

- **When a leak is detected in the pack 1 bay area, and if one or both pack valves do not automatically close or if the CSAS does not automatically shut down:**

  The following valves automatically close:
  - The engine 1 bleed valve
  - L3 The engine 1 bleed overpressure valve
  - L2 The APU bleed valve
  - The crossbleed valve.

- **When a leak is detected in the pack 2 bay area, and if one or both pack valves do not automatically close or if the CSAS does not automatically shut down:**

  The following valves automatically close:
  - The engine 2 bleed valve
  - L3 The engine 2 bleed overpressure valve
  - L2 The crossbleed valve.

For more information on the associated ECAM procedure: *Refer to PRO-ABN-AIR AIR PACK 1(2) LEAK*.

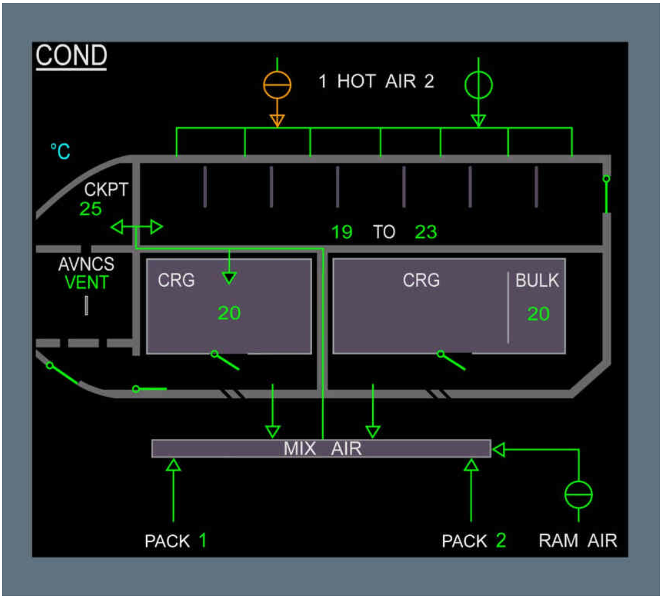
Ident.: DSC-36-10-60-10-00003053.0001001 / 23 APR 14

HOT-AIR LEAKS

When a leak is detected on one of the hot-air ducts of the air conditioning hot-air system, the corresponding hot-air valve automatically closes. The hot-air system on the affected side is no longer available.

L3 The trim air shutoff valve also automatically closes.

Hot Air 1 Bleed Leak



L2
- **If the hot-air valve does not automatically close:**
  Both pack valves of the associated pack automatically close.

L3
- **If the trim air shutoff valve does not automatically close:**
  The hot-air valve on the opposite side automatically closes.

L2 For more information on the associated ECAM procedure: *Refer to PRO-ABN-AIR AIR HOT AIR 1(2) LEAK*.

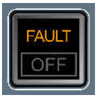
ENG 1(2) BLEED PB-SW

	The engine bleed valve is automatically controlled.
	The engine bleed valve and the HP valve are closed. The associated engine bleed overpressure valve is also closed.

L13

L12



Comes on:
- When the engine bleed valve open position disagrees with the requested position, or
  Associated with one of the following ECAM alerts: AIR ENG 1(2) BLEED FAULT (*Refer to procedure*).
- When an overtemperature or an overpressure is detected, or the reverse flow protection is failed, or
  Associated with the following ECAM alert: AIR ENG 1(2) BLEED FAULT (*Refer to procedure*).
- When a leak is detected in the APU bleed duct (ENG 1 BLEED pb-sw only), or in the engine or wing bleed duct.

  Associated with one of the following ECAM alerts:
  - AIR APU BLEED LEAK (*Refer to procedure*), or
  - AIR ENG 1(2) BLEED LEAK (*Refer to procedure*), or
  - AIR L(R) WING LEAK (*Refer to procedure*).

The FAULT light goes off, when the associated ENG 1(2) BLEED pb-sw is set to OFF, and the applicable failure disappears.

OVERVIEW

Ident.: DSC-38-10-00013048.0001001 / 17 NOV 17
Applicable to: ALL

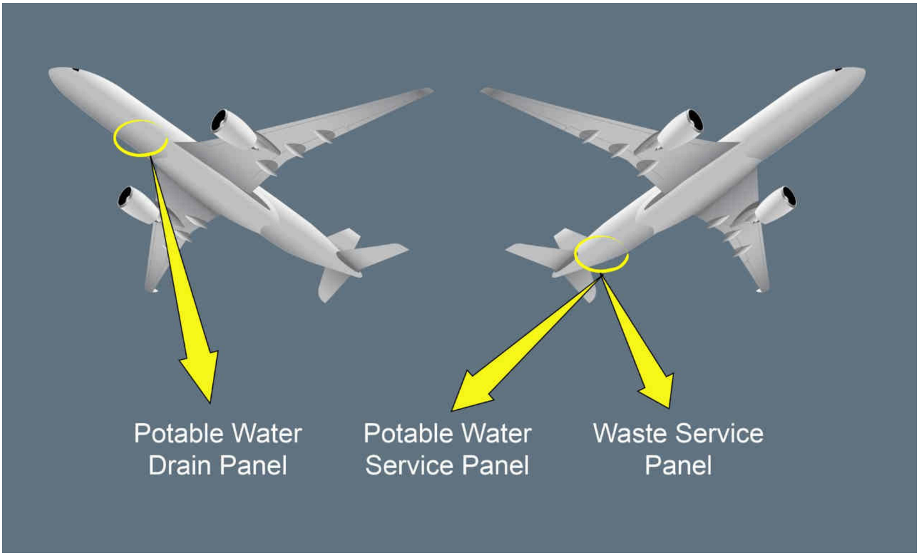
The potable water and waste system includes the three following subsystems:
- The potable water system that supplies potable water to the lavatories and galleys
- The waste water system that drains overboard the waste water from the lavatory washbasins and galley sinks
- The vacuum toilet system that drains and stores the waste of the galleys and toilets.

On the aircraft:
- The potable water is stored in two water tanks
- The toilet waste is stored in two storage tanks.

The cabin crew uses the Flight Attendant Panel (FAP) to control and monitor the water and waste system.

L3 *Refer to CCOM/06-60-40-40 WATER/WASTE Page*

Overview



The ground crew supplies the aircraft with potable water and performs waste servicing via:
- The potable water service panel, in the aft lower fuselage
- The potable water drain panel, in the forward lower fuselage
- The waste service panel, in the aft lower fuselage.

POTABLE WATER SYSTEM

Ident.: DSC-38-10-00013049.0001001 / 24 APR 14
Applicable to: ALL

The potable water system supplies potable water from the water tanks to the lavatories and galleys.

Service Panel

L2 The ground crew can fill and drain the potable water system via the fill/drain valve, from the potable water service panel.
The filling mode enables the ground crew to fill the potable water tanks to a preselected value.

L3 The water quantity in the tanks can be preselected by:
- The cabin crew via the FAP
- The ground crew via the potable water indication panel, directly accessible via the potable water service panel.

L2 The draining mode enables full drainage of the potable water system, and is available on ground and only during water supply operations. Drainage is performed by the ground crew via the potable water drain panel and the potable water service panel.

L1 The cabin crew can manually control the potable water supply via shutoff valves. These manual shutoff valves can isolate the washbasin and toilet from the potable water system. These valves are behind an access door under the toilet bowl.
A freezing protection system provides electrical heating and thermal insulation to the potable water system.

L3 The potable water is stored in two potable water tanks. These tanks are in the aft section of the aircraft, near the pressure bulkhead. The ground crew fills the two water tanks at the same rate, and can drain them via gravity.

L2 Two redundant pressure sources enable water tank pressurization:
- The bleed air pressure or ground air pressure
- A potable water pump.

L3 Each of these two sources can provide sufficient pressure for the potable water supply.
On ground, the water pump controls tank pressurization when no bleed air is available. If the water pump fails during the flight, the bleed air is sufficient to pressurize the water tanks.
To prevent internal contamination of the potable water system, a water treatment module is installed onboard, between the fill/drain valve and the potable water tanks. The water treatment module maintains water quality during the filling and during flight, and operates continuously during flight.

WASTE WATER SYSTEM

Ident.: DSC-38-10-00013184.0001001 / 24 APR 14
Applicable to: ALL

The waste water system drains the waste water from:
- The galley sinks
- The lavatory washbasins.

The waste water is discharged overboard via two heated drain masts.

L2 For more information on heated drain masts, *Refer to DSC-30-20-10 Water/Waste Anti-ice*

OVERVIEW

Ident.: DSC-42-10-00003016.0002001 / 03 JAN 19
Applicable to: ET-AWO, ET-AWP, ET-AYA, ET-AYB

Most of the aircraft systems can communicate with each other via a high-speed digital network, referred to as avionics network, instead of via conventional wires.
For communication on the avionics network, most of the avionics systems use the concept of the Integrated Modular Avionics (IMA).
The principle of the IMA is to provide a same hardware shared by several avionics systems for computation and communication on the avionics network.

The IMA components, referred to as IMA modules, are:
- The Core Processing Input/Output Modules (CPIOMs)
- The Common Remote Data Concentrators (CRDCs).

Two types of avionics equipment monitor and control the aircraft systems:
- The conventional avionics equipment, with computers that are fully assigned to a specific aircraft system, or
- The CPIOMs that can host several functions dedicated to different aircraft systems.

The CRDCs are an interface between some conventional avionics equipment and the avionics networks.
The CPIOMs, the CRDCs, and some conventional avionics equipment are directly connected to the avionics networks.

AVIONICS NETWORKS

There are two independent avionics networks.
The avionics networks are referred to as Network A and Network B.
The avionics networks transmit the information that comes from the aircraft systems via several transit points, referred to as switches.
For redundancy and availability purposes, some aircraft systems are connected to both avionics networks.

L2 Note: *In addition, some aircraft systems can communicate with each other via conventional wiring (i.e. ARINC 429 data buses, analog signals), independently of the avionics networks. The backup wiring ensures that the communication remains available if both avionics networks fail. For more information on failures that affect both networks, Refer to DSC-42-20 Multiple Switch or Cable Failures That Affect Both Networks.*

SWITCHES

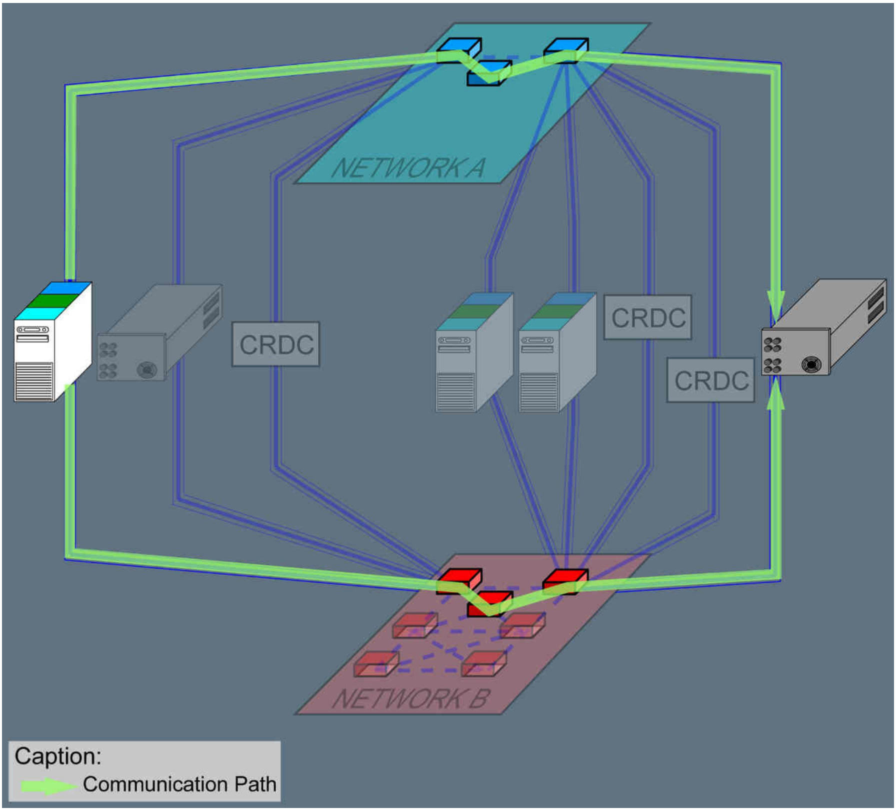
On each avionics network, the switches automatically manage the communication between the aircraft systems via high-speed digital cables. The switches:
- Connect the aircraft systems to the avionics network
- Route the information between the appropriate aircraft systems.

L3 On each network, the information that one aircraft system exchanges with another system follows a predefined path via one or several switches.

L2 The avionics network has three pairs of switches. For each pair, one switch is on Network A, the other on Network B. The other switches are only connected to Network B.

L3 The avionics network switches are in the avionics bay.

Switch Connection



Ident.: DSC-42-10-10-00003020.0001001 / 24 APR 14

SWITCHES

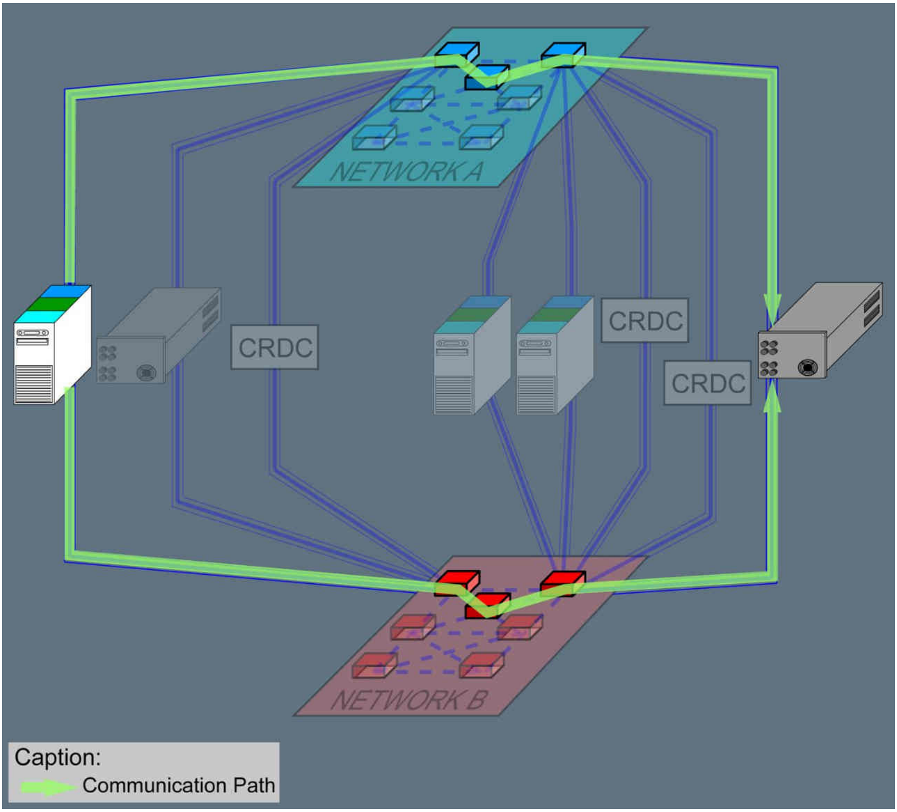
On each avionics network, the switches automatically manage the communication between the aircraft systems via high-speed digital cables. The switches:
- Connect the aircraft systems to the avionics network
- Route the information between the appropriate aircraft systems.

L3 On each network, the information that one aircraft system exchanges with another system follows a predefined path via one or several switches.

L2 The avionics network has several pairs of switches. For each pair, one switch is on Network A, the other on Network B.

L3 The avionics network switches are in the avionics bay.

Switch Connection



CPIOM

Ident.: DSC-42-10-20-00003019.0002001 / 03 JAN 19
Applicable to: ET-AWO, ET-AWP, ET-AYA, ET-AYB

A CPIOM is an IMA module that provides a same hardware shared by several avionics systems for computation and communication.
For computation, the CPIOM hosts several functions, in order to monitor and control some avionics systems. As a result, one CPIOM can replace several conventional avionics equipment.

CPIOM

CRDC

Ident.: DSC-42-10-00003018.0002001 / 03 JAN 19
Applicable to: ET-AWO, ET-AWP, ET-AYA, ET-AYB

The CRDC is a remote gateway and data concentrator module that interfaces the following aircraft systems to the avionics network:
- A wide range of sensors and/or actuators
- Conventional avionics equipment not compatible with the avionics network.

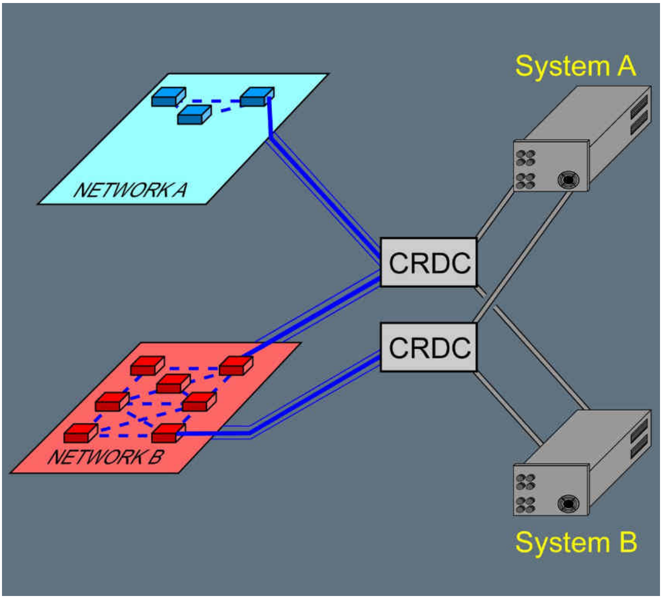
L3 The CRDC transforms data signals from a specific format (e.g. ARINC 429 data buses, analog signals) into digital format usable by the aircraft systems connected to the avionics networks, and vice versa.

L1 Most of the aircraft systems that use CRDCs are connected to two or more CRDCs, to ensure the redundancy of all functions of the aircraft systems.

L2 There are 29 CRDCs.

L1 The CRDCs are in the pressurized area of the aircraft, next to the relevant groups of sensors and actuators.

CRDC



CRDC

SINGLE CRDC FAILURE

Ident.: DSC-42-20-00012697.0002001 / 03 JAN 19
Applicable to: ET-AWO, ET-AWP, ET-AYA, ET-AYB

Most of the aircraft systems use two or more CRDCs. In the case of a single CRDC failure, the remaining CRDCs will maintain communication on the avionics network. There is no operational effect.

L3 For dispatch purposes, the ECAM displays the IMA CRDC XXX dispatch message.

L2 However, a limited number of aircraft systems are only connected to a single CRDC. If this CRDC fails the ECAM displays the alerts of the affected aircraft systems, along with a DUE TO IMA MODULE FAULT subtitle in the second line of the ECAM alert.

SINGLE CPIOM FAILURE

Ident.: DSC-42-20-00003025.0001001 / 24 APR 14
Applicable to: ALL

In the case of a single CPIOM failure, the aircraft systems controlled and monitored by the failed CPIOM may be affected. In this case, the ECAM displays the alert of the applicable aircraft systems.

L2 Depending on the affected aircraft systems, the ECAM will display the following:
- The ECAM alert of the applicable aircraft system, along with a DUE TO IMA MODULE FAULT subtitle in the second line of the ECAM alert title

L3 - For dispatch purposes, the IMA CPIOM XXX dispatch message.

MULTIPLE CRDC/CPIOM FAILURES

Ident.: DSC-42-20-00012698.0002001 / 03 JAN 19
Applicable to: ET-AWO, ET-AWP, ET-AYA, ET-AYB

The following remote cases of multiple IMA module failures can occur:
- Failure of two or more CRDCs, or
- Failure of two or more CPIOMs, or
- Failure of one or more CRDCs and one or more CPIOMs.

If all CPIOMs (and/or CRDCs) connected to an aircraft system fail, the communication between the aircraft system and the avionics networks is lost. The aircraft system that uses the failed IMA modules may be affected. In this case, the ECAM displays the alert of the applicable aircraft systems.

L2 Depending on the affected aircraft systems, the ECAM will display the following:
- IMA MODULE FAULT (*Refer to PRO-ABN-IMA IMA MODULE FAULT*) ECAM alert, before all other ECAM alerts of the aircraft systems concerned by the multiple IMA module failures
  L3 The IMA MODULE FAULT alert has the highest priority of the ECAM cautions (Level 2 and level 1). For more information, *Refer to DSC-31-CDS-60-10-10 Priority of Alerts*
- L2 The ECAM alerts of the applicable aircraft systems, along with a DUE TO IMA MODULE FAULT subtitle in the second line of each applicable ECAM alert title. The DUE TO IMA MODULE FAULT subtitle clearly informs the flight crew that a multiple IMA module failure is the root cause of the ECAM alert of the affected aircraft system.

L3 *Note:* *In the case of a single ECAM alert with the DUE TO IMA MODULE FAULT subtitle, the ECAM does not display the IMA MODULE FAULT ECAM alert.*

- For dispatch purposes, depending on the failed IMA modules, the ECAM can display the combination of the following dispatch messages:
  - The IMA MULTIPLE MODULES dispatch message (*Refer to MMEL/ME-DM-IMA IMA MULTIPLE MODULES*), when at least two or more failed CPIOMs (and/or CRDCs) of a given aircraft system lead to an ECAM caution with the DUE TO IMA MODULE FAULT subtitle
  - The IMA CPIOM XXX dispatch message, when a single failure of CPIOM leads to an ECAM caution with the DUE TO IMA MODULE FAULT subtitle
  - The IMA CRDC XXX dispatch message, when a single failure of CRDC leads to an ECAM caution with the DUE TO IMA MODULE FAULT subtitle.

Multiple CRDC Failures

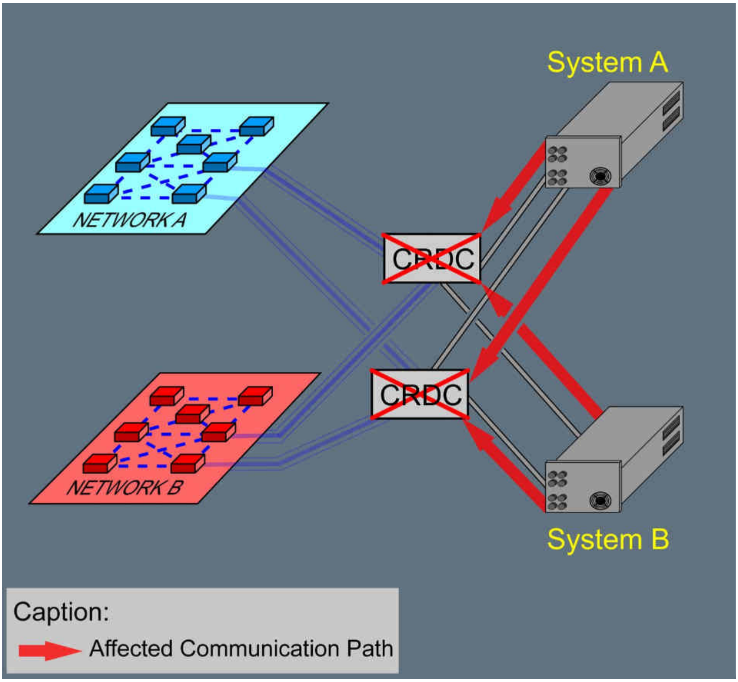
Multiple CRDC Failures



SWITCH OR CABLE FAILURE THAT AFFECTS ONE NETWORK

Ident.: DSC-42-20-00003021.0002001 / 03 JAN 19
Applicable to: ET-AWO, ET-AWP, ET-AYA, ET-AYB

Three switches/cable are paired to ensure redundancy of the communication between aircraft systems on both avionics network. In the case of switch/cable failure of paired equipment, there is no operational effect. The other switch/cable of the pair on the other network maintains the communication between aircraft systems.

L3 For dispatch purposes, depending on the switch or cable failure, the ECAM displays one of the following dispatch messages:

- AVIONICS NETWORK SW OR CABLE (*Refer to MMEL/ME-DM-AVIONICS_N AVIONICS NETWORK SW OR CABLE*)
- AVIONICS NETWORK SINGLE CABLE (*Refer to MMEL/ME-DM-AVIONICS_N AVIONICS NETWORK SINGLE CABLE*)

- AVIONICS NETWORK SINGLE SW (*Refer to MMEL/ME-DM-AVIONICS_N AVIONICS NETWORK SINGLE SW*)
- AVIONICS NETWORK MULTIPLE SW/CABLE (*Refer to MMEL/ME-DM-AVIONICS_N AVIONICS NETWORK MULTIPLE SW/CABLE*).

SINGLE OR MULTIPLE SWITCH OR CABLE FAILURES THAT AFFECT BOTH NETWORKS

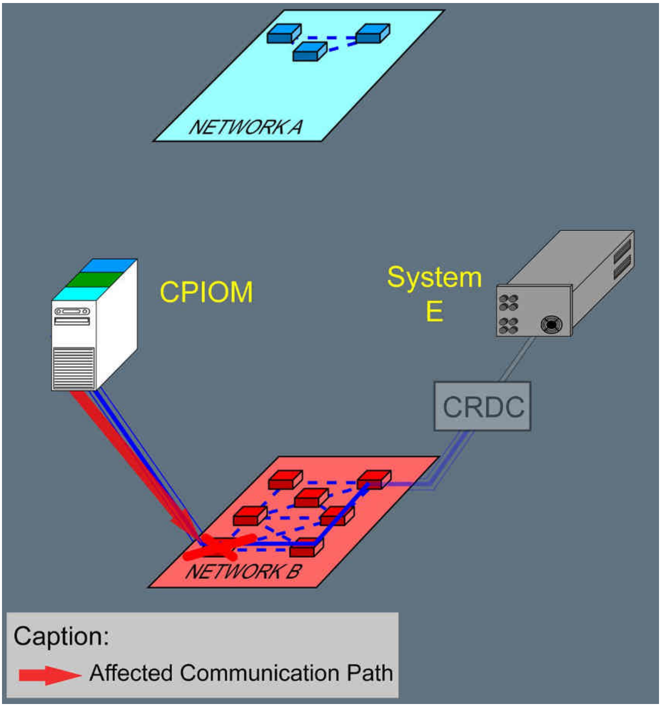
Ident.: DSC-42-20-00003022.0003001 / 03 JAN 19

Applicable to: ET-AWO, ET-AWP, ET-AYA, ET-AYB

In the case of single or multiple switch (and/or cable) failures that affect both avionics networks, the communication via the failed switches (and/or cables) is lost.
Depending on the failed switches (cables), if the communication between some aircraft systems is no longer possible on both networks, the ECAM displays the alerts of the applicable aircraft systems.

COMMUNICATION BETWEEN AIRCRAFT SYSTEMS IS LOST

Communication Between Aircraft Systems Is Lost



The communication between the CPIOM and the aircraft system E is no longer possible via the failed switches (and/or cables) on both networks. The communication between both aircraft systems is lost. The ECAM will display the alerts of the applicable aircraft systems.

L2 The ECAM displays the following:

- The AVIONICS NETWORK SWITCH/CABLE FAULT alert (*Refer to PRO-ABN-AVNCS AVIONICS NETWORK SWITCH/CABLE FAULT (NETWORK DEGRADED)*), before all other ECAM cautions of the aircraft systems concerned by the multiple switch (and/or cable) failures

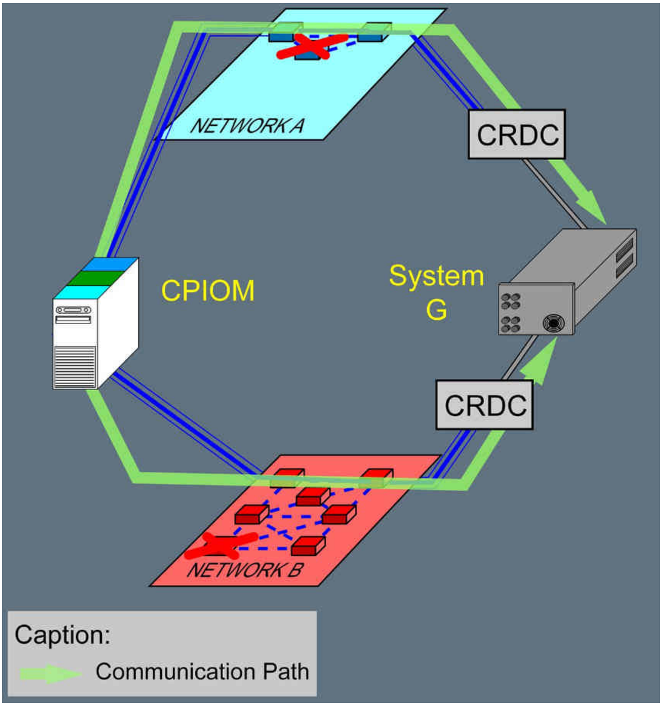
  L3 The AVIONICS NETWORK SWITCH/CABLE FAULT alert has the highest priority of the ECAM cautions (Level 2 and level 1). For more information, *Refer to PRO-ABN-AVNCS AVIONICS NETWORK SWITCH/CABLE FAULT (NETWORK DEGRADED)*

- L2 Depending on the affected aircraft systems, the ECAM alerts of the applicable aircraft systems.
- L3 For dispatch purposes, the AVIONICS NETWORK MULTIPLE SW/CABLE dispatch message (*Refer to MMEL/ME-DM-AVIONICS_N AVIONICS NETWORK MULTIPLE SW/CABLE*).

L1 *Note:* *Some essential aircraft systems (e.g. PRIMs, EEC, ADIRS, FWS, CDS, SFCC, CPCS, LGERS, BCS, MMR) can still communicate with each other via backup conventional wires (i.e. ARINC 429 data buses, analog signals).*

COMMUNICATION BETWEEN AIRCRAFT SYSTEMS IS NOT LOST

Communication Between Aircraft Systems Is Not Lost



The communication between the CPIOM and the aircraft system G remains available. The communication is not affected by the failed switches (and/or cables). There is no operational effect for these aircraft systems.

L2 However, the ECAM displays:

- The AVIONICS NETWORK SWITCH/CABLE FAULT alert (*Refer to PRO-ABN-AVNCS AVIONICS NETWORK SWITCH/CABLE FAULT (NETWORK DEGRADED)*) for crew awareness.

L3
- For dispatch purposes, the AVIONICS NETWORK MULTIPLE SW/CABLE dispatch message (*Refer to MMEL/ME-DM-AVIONICS_N AVIONICS NETWORK MULTIPLE SW/CABLE*).

MULTIPLE SWITCH OR CABLE FAILURES THAT AFFECT BOTH NETWORKS

Ident.: DSC-42-20-00003022.0002001 / 03 JAN 19
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN

In the remote case of multiple switch (and/or cable) failures that affect both avionics networks, the communication via the failed switches (and/or cables) is lost.
Depending on the failed switches (cables), if the communication between some aircraft systems is no longer possible on both networks, the ECAM displays the alerts of the applicable aircraft systems.

GENERAL

Ident.: DSC-44-10-20-00023459.0001001 / 06 SEP 17
Applicable to: ALL

The Cabin Intercommunication Data System (CIDS) is the main cabin management system that provides most of the cabin related functions to the flight crew, the cabin crew, and the passengers.

Particularly, the CIDS supports:
- The cabin communication
- The cabin signs.

L2 The CIDS also hosts the Smoke Detection Function (SDF), *Refer to DSC-26-20 Smoke Detection System*.

L1 ARCHITECTURE

The CIDS can be considered as a server with a network that enables the intercommunication of multiple interfaces like cockpit panels, handsets, Flight Attendant Panels (FAPs), etc.

L3 The main components of the CIDS are:
- Two identical CIDS directors that ensure the data transmission between the units interfaced with the CIDS
  Only one director is active at a time, while the other director is on standby and becomes active automatically in the case of a failure, or a reset.
- Decoder/Encoder Units (DEUs) A and B that adapt the format of the transmitted data to, or out of, the CIDS directors.
  DEUs A interface with all passenger functions, and crew rest compartments ◁ loudspeakers and signs. DEUs B interface with cabin crew functions, and crew rest compartments ◁ handsets.

For more information about the exhaustive list of components of the CIDS, *Refer to CCOM/04-10 Components of the CIDS in the Cabin*.

CABIN COMMUNICATION

Ident.: DSC-44-10-20-00023462.0001001 / 07 NOV 16
Applicable to: ALL

The CIDS provides the following cabin communication functions:

- Passenger Address (PA)

L2 For more information, *Refer to DSC-23-10-20 Passenger Address*.

L1 - Cabin interphone

L2 For more information, *Refer to DSC-23-10-20 Cabin Interphone*.

L1 - Service interphone

L2 For more information, *Refer to DSC-23-10-20 Service Interphone*.

L1 - Calls

L2 For more information, *Refer to DSC-23-20 Calls Panel*.

L1 - Evacuation (EVAC) signaling ◁

L2 For more information, *Refer to DSC-23-20 EVAC Panel (if installed)*.

L1 - Emergency Crew Alerting System (ECAS) ◁

L2 For more information, See below.

L1 - Cabin ready indication.

L2 For more information, See below.

L1 ECAS ◁

The ECAS enables the flight crew or the cabin crew to alert respectively the cabin or the cockpit in the case of a threat, like a cockpit intrusion.
Depending on the aircraft customization, if the ECAS is activated, a combination of aural and/or visual alerts triggers in the cabin and the cockpit.
If the ECAS is activated from the cabin, the CVMS ◁ temporarily displays the affected cabin area on the VIDEO SD page.

L2 For more information about the CVMS ◁ , *Refer to DSC-31-CDS-110-10 Cabin Video Monitoring System*.

L1 CABIN READY INDICATION

The cabin-ready function enables the cabin crew to inform the flight crew that the cabin is ready for takeoff or landing.

When the cabin crew activates the cabin-ready signal, only one of the following occurs:
- The CABIN READY memo ◁ appears on the WD, or

  L2 For more information about the CABIN READY memo ◁ , *Refer to DSC-44-20 CABIN READY (if installed)*.

L1
- The CABIN : READY indication ◁ appears in:
  - The T.O and LDG memos
  - The Before Takeoff and Landing checklists.

SIGNS

Ident.: DSC-44-10-20-00023463.0001001 / 07 JUL 16
Applicable to: ALL

In addition to the manual control of cabin signs from the SIGNS panel, the CIDS provides automatic activation of the cabin signs based on the extension of the landing gear or the slats, for example.

The CIDS manages the activation of the following signs:
- FASTEN SEAT BELT
- RETURN TO SEAT
- NO SMOKING ◁

- NO PED ◁
- LAVATORY OCCPD light in the cockpit
- NO MOBILE ◁
- EXIT.

L2 For more information about the signs, *Refer to DSC-33-50-10 Overview*.

GENERAL

Ident.: DSC-44-10-30-00023464.0004001 / 03 JUL 20
Applicable to: ET-ATY, ET-AUA, ET-AUB

The In-Flight Entertainment (IFE) and the cabin connectivity provide the cabin occupants with various services that depend on the aircraft customization.

IN-FLIGHT ENTERTAINMENT

The IFE provides passengers with various entertainment services from audio and video content to real-time flight information.

L2 For more information about the IFE, *Refer to CCOM/08-10 General Information about the IFE System* .

IFE components are installed in a dedicated IFE bay, located behind the bulk cargo compartment.
When the IFEC pb-sw of the CAB SYS SMOKE panel is set to OFF, the IFE center stops.

1 L1 CABIN CONNECTIVITY

The cabin connectivity provides the following services:

- For passengers:
  - Onboard telephony via the On-board Mobile Telephony System (OMTS) ◁ . This service is ensured via the CINS.
  - Access to the Internet from the in-seat display unit of the IFE, or from Personal Electronic Devices (PEDs) via a passenger Wi-Fi ◁ network.
- For cabin crew, access to a secured cabin crew Wi-Fi ◁ network that enables the connection of Telemedicine ◁ devices and provides wireless access to the cabin crew mail application ◁ .

L2 For more information about the cabin crew Wi-Fi ◁ , *Refer to CCOM/06-230-10 General Information about the Crew WiFi Application*.
For more information about the cabin crew mail application, *Refer to CCOM/06-220-10 General Information about the Cabin Crew Mail (CCMail) Application*.

The cabin connectivity uses the SATCOM and the KA-Band Antenna to interface with on-ground services .
The components that support the cabin connectivity (CINS, OMTS ◁ , and the cabin crew Wi-Fi ◁ unit) are installed in the PAX BBAND bay, located behind the bulk cargo compartment.
When the PAX BBAND pb-sw of the CAB SYS SMOKE panel is set to OFF, the OMTS ◁ and the cabin crew connectivity is no longer available.
The PAX internet services are hosted in the IFE.
When the IFEC pb-sw of the CAB SYS SMOKE panel is set to OFF, the PAX internet service is no longer available.

The In-Flight Entertainment Center (IFEC) provides the cabin occupants with various entertainment and cabin connectivity services that depend on the aircraft customization.

L2 The components of the IFEC are installed in the IFE bay, located behind the bulk cargo compartment.

When the IFEC pb-sw of the CAB SYS SMOKE panel is set to OFF, the IFE center stops.

L1 IN-FLIGHT ENTERTAINMENT

The IFE provides passengers with various entertainment services from audio and video content to real-time flight information.

L2 For more information about the IFE, *Refer to CCOM/08-10 General Information about the IFE System* .

3 L1 CABIN CONNECTIVITY

The cabin connectivity provides the passengers with:
- On-board telephony via an On-board Mobile Telephony System (OMTS) ◁
- Access to the Internet from Personal Electronic Devices (PEDs) via a passenger Wi-Fi ◁ network.

PASSENGER ENTERTAINMENT

Ident.: DSC-44-10-30-00023465.0001001 / 07 JUL 16
Applicable to: ALL

The IFE system is a highly customized system and can provide the passengers with various entertainment services. This chapter only describes IFE services that have an interface in the cockpit.

AIRCRAFT REAL-TIME FLIGHT INFORMATION

The IFE system provides the passengers with various services which may include:
- Moving maps
  The moving maps enable the passengers to see various map views and obtain real-time flight information like the time and distance to destination, the aircraft speed, etc.
- External views of the aircraft from the ETACS ◁ .
  The landscape camera ◁ , the belly TAC ◁ , and the vertical stabilizer TAC ◁ provide live video images to the IFE.

L2 For more information about the ETACS ◁ , *Refer to DSC-31-CDS-110-10 External and Taxiing Aid Camera System*.

L1 The flight crew can stop the transmission of live video images to the IFE via:
- The LANDSCAPE CAMERA pb-sw ◁ of the CABIN panel (*Refer to DSC-44-20 LANDSCAPE CAMERA pb-sw (if installed)*)
- Depending on the Operator customization, the PAX INFO pb-sw ◁ of the CABIN panel (*Refer to DSC-44-20 PAX INFO pb-sw (if installed)*).

PED POWER OUTLETS ◁

The passenger seats may be equipped with PED power outlets.

The flight crew can stop the electrical supply of all PED power outlets via:
- The PAX PERS ELEC SPLY pb-sw of the CABIN panel (*Refer to DSC-44-20 PAX PERS ELEC SPLY pb-sw (if installed)*)
- The PAX SYS pb-sw of the ELEC panel (*Refer to DSC-24-20 PAX SYS pb-sw*).

ON-BOARD MOBILE TELEPHONY SYSTEM ◁

Ident.: DSC-44-10-30-00023466.0001001 / 07 JUL 16
Applicable to: ALL

In flight, the OMTS enables the passengers to use their mobile phones to make phone calls and send messages.

The OMTS automatically activates when:
- The aircraft flies over a country where the use of mobile phones is authorized
- The aircraft flies above an altitude threshold.

L2 *Note:* *As per regulation, the OMTS must be inhibited below 3 000 m (9 842 ft) AGL to avoid interference with the ground mobile network. Depending on the aircraft customization, the altitude threshold for the availability of the OMTS may be more restrictive (e.g. 4 000 m (13 123 ft)).*

L1 The flight crew can stop all wireless emissions, which includes the OMTS, via:
- The MOBILE COM pb-sw of the CABIN panel (*Refer to DSC-44-20 MOBILE COM pb-sw (if installed)*)
- Depending on the airline customization, the PAX INFO pb-sw ◁ of the CABIN panel (*Refer to DSC-44-20 PAX INFO pb-sw (if installed)*).

L2 The cabin crew can independently activate or deactivate the functions of the OMTS (voice calls, messages, etc.) via the FAP.

L1 In the cabin, the NO MOBILE signs indicate the availability of the mobile telephony services to the passengers.

L2 For more information about the control of the NO MOBILE signs, *Refer to DSC-33-50-20 NO MOBILE sw*.

PASSENGER WI-FI ◁

Ident.: DSC-44-10-30-00023467.0001001 / 03 JUL 20
Applicable to: ALL

4 The passengers access the Internet via Wi-Fi from their PEDs.

The flight crew can stop all wireless emissions, which includes the Wi-Fi network, via:
- The MOBILE COM pb-sw of the CABIN panel (*Refer to DSC-44-20 MOBILE COM pb-sw (if installed)*)
- Depending on the airline customization, the PAX INFO pb-sw of the CABIN panel (*Refer to DSC-44-20 PAX INFO pb-sw (if installed)*).

L2 The cabin crew can independently activate or deactivate the cabin connectivity services via the FAP.
L1 In the cabin, the NO PED signs indicates to the passengers when they cannot use their PEDs.
L2 For more information about the control of the NO PED signs , *Refer to DSC-33-50-20 NO PED sw*.

VIDEO MONITORING SYSTEM

Ident.: DSC-44-10-40-00023080.0001001 / 07 JUN 19
Applicable to: ALL

For more information about the architecture of the video monitoring system, *Refer to DSC-31-CDS-110-10 Overview*.

COCKPIT DOOR SURVEILLANCE SYSTEM

The CDSS includes cameras in the cockpit door area to provide live video images that enable the flight crew to identify persons who request entry in the cockpit.

L2 For more information about the CDSS, *Refer to DSC-31-CDS-110-10 Cockpit Door Surveillance System*.

L1 CABIN VIDEO MONITORING SYSTEM

The CVMS includes cameras in the cabin to provide live video images that enable the flight crew to monitor the cabin from the cockpit.

L2 For more information about the CVMS, *Refer to DSC-31-CDS-110-10 Cabin Video Monitoring System*.

L1 LOWER DECK SURVEILLANCE FUNCTION

The CVMS includes cameras in the cargo to provide live video images that enable the flight crew to monitor the cargo from the cockpit.

L2 For more information about the Lower Deck Surveillance Function, *Refer to DSC-31-CDS-110-10 Lower Deck Surveillance Function*.

OVERVIEW

Ident.: DSC-46-ATC-10-10-00000436.0001001 / 08 NOV 18
Applicable to: ALL

The Air Traffic Control (ATC) Datalink system provides Communication, Navigation, and Surveillance for Air Traffic Management (CNS/ATM) services.
The ATC Datalink system has several applications that the flight crew uses to communicate with ATC centers. These applications enable air traffic controllers to follow the aircraft navigation, and enhance air traffic.

The ATC Datalink system provides:
- FANS A applications (FANS 1/A in ICAO designation) that use ACARS ground network, for operations in remote areas and in oceanic areas:
  - Notification
  - Controller/Pilot Data Link Communication (CPDLC)
  - Automatic Dependent Surveillance Contract (ADS-C).
- FANS B applications (ATN B1 in ICAO designation) that use ATN ground network, for operations in high-density continental areas:
  - Notification
  - CPDLC.
- ATS 623 applications (ACARS ATS in ICAO designation) that use ACARS ground network:
  - Departure Clearance (DCL)
  - Oceanic Clearance (OCL)
  - Digital ATIS (D-ATIS).

For the description of associated Performance-Based Communication and Surveillance (PBCS) concept and requirements, *Refer to PRO-SPO-PBCS General*.

COMMUNICATION AND NAVIGATION FOR AIR TRAFFIC MANAGEMENT

At the beginning of the flight, the flight crew sends a notification message to the ATC center, via the Notification application.

L2 For more information, *Refer to DSC-46-ATC-10-20 Notification*.

L1 An air traffic controller will then establish a connection between the aircraft and the ATC center. Then, the flight crew can exchange messages with the ATC center, via the mailbox. The messages that the flight crew sends to the ATC center can be built with preset frames and modified via the ATC COM page of the MFD.

Depending on the type of datalink exchange, one of the following applications supports the communication:
- Controller/Pilot DataLink Communication (CPDLC) application (*Refer to DSC-46-ATC-10-30 General*), or
- ARINC623 (A623) applications, for some specific types of requests (*Refer to DSC-46-ATC-10-50 General*).

The Message Record function records uplink (from-ground-to-air) and downlink (from-air-to-ground) messages that the flight crew and the air traffic controller exchange. The Message Record function also enables the flight crew to display any recorded messages.

L2 For more information, *Refer to DSC-46-ATC-10-40 Message Record*.

L1 NAVIGATION AND SURVEILLANCE FOR AIR TRAFFIC MANAGEMENT

The Automatic Dependent Surveillance (ADS) system sends aircraft position and aircraft navigation data to ATC centers and other aircraft.

There are two different ADS applications:
- ADS-Contract (ADS-C)
  The ADS-C enables the flight crew to automatically send information, following an agreement with one or more ATC centers. The ADS-C can send information on a periodic basis, during a specific event (e.g. waypoint sequencing), or on demand.
- ADS-Broadcast (ADS-B)
  The ADS-B enables the broadcast of aircraft position and navigation data to other users (ATC centers or other aircraft) to enhance traffic awareness. The ATC Datalink system does not host the ADS-B.

L3 CPIOM-J51 hosts the ATC Datalink system.

Ident.: DSC-46-ATC-10-10-10-00000438.0001001 / 23 APR 14

MULTIFUNCTION DISPLAY (MFD)

The MFD displays the ATC COM pages, where the flight crew can:
- Manage the ATC Datalink connections
- Request clearances

- Generate reports and modify downlink messages
- Consult and manage received messages
- Request and consult digital ATIS
- Generate emergency messages.

Ident.: DSC-46-ATC-10-10-10-00000439.0001001 / 23 APR 14

MAILBOX

The mailbox displays the messages that the flight crew and the air traffic controller exchange. The center upper display unit continuously displays the mailbox.

L2 *Note:* *ATIS messages appear on the MFD only.*

Ident.: DSC-46-ATC-10-10-10-00000440.0001001 / 23 APR 14

KEYBOARD AND CURSOR CONTROL UNIT (KCCU)

The two KCCUs enable the flight crew to interact with the ATC Datalink system (e.g. to type or select messages or requests).

Ident.: DSC-46-ATC-10-10-10-00000441.0001001 / 23 APR 14

PRINTER

The flight crew can print ATC messages from the MFD or the mailbox.

L12

Note: *Each time the flight crew prints a message, they must check that the printed message is identical to the message on the display unit.*
The reference information is the information that the display unit displays.

Ident.: DSC-46-ATC-10-10-10-00000442.0001001 / 23 APR 14

FMS

The ATC Datalink system interfaces with the three Flight Management Computers (FMCs).

The flight crew can:

- Directly load a route clearance or a route modification from the ATC to the secondary flight plan (SEC 3)
  L2 For more information, *Refer to DSC-22-FMS-10-40-60 Secondary Flight Plan Initialization*.
- L1 Generate a request message for a route clearance from the FMS secondary flight plan pages of the MFD
  L2 The flight crew can transfer the request message to the mailbox in order to send it.

L1 - Monitor a flight parameter in the FMS

L2 When the monitored parameter reaches a given value, the FMS displays a reminder to the flight crew (*Refer to DSC-46-ATC-20-70 ATC MSG pb*). Also, the ATC Datalink system prepares an answer in the mailbox. The flight crew can modify the message before it is transmitted to the ATC center. For more information, *Refer to DSC-46-ATC-10-30 Modify*.

L1 - Transmit the aircraft position and altitude information for ADS-C position reports and to answer uplink messages.

Ident.: DSC-46-ATC-10-10-10-00000443.0001001 / 23 APR 14

FWS

The FWS enables to:

- Activate the two ATC MSG pb, when the mailbox receives a message, or when a monitored parameter reaches a given value

L2 For more information, *Refer to DSC-46-ATC-20-70 ATC MSG pb*.

L1 - Trigger an audio indicator (ring), when the mailbox receives a message, or when a monitored condition is satisfied.

L2 For more information, *Refer to DSC-46-ATC-20-90 Audio Indicators*.

Ident.: DSC-46-ATC-10-10-10-00000444.0001001 / 07 JUL 16

AVIONICS COMMUNICATION ROUTER (ACR)

The ACR provides the aircraft with datalink communication. The ACR can use either satellite communication (SATCOM), or radio communication (VHF or HF) to operate.

L2 HF data mode ◁ is optional
For more information, *Refer to DSC-23-10-10 ACR*.

L1 For operations in remote and in oceanic areas (FANS A), the ATC Datalink system uses VHF, and SATCOM, as installed and in the order of priority that the aircraft operator defines.
For operations in high density continental areas (FANS B), the ATC Datalink system uses VHF only.

Ident.: DSC-46-ATC-10-10-10-00000446.0001001 / 23 APR 14

AIR DATA AND INERTIAL REFERENCE SYSTEM (ADIRS)

The ADIRS provides time and position data to the ATC Datalink system.

Ident.: DSC-46-ATC-10-10-10-00000447.0001001 / 09 MAR 16

SURVEILLANCE (SURV) SYSTEM

The ATC Datalink system interfaces with the SURV system and enables the flight crew to:

- Provide the ATC center with the TCAS status sent via the ADS applications
- Provide the ATC center with the SQUAWK code in answer to the CONFIRM SQUAWK uplink message
- Create ITP requests for aircraft equipped with ADS-B TRAFFIC ◁ .

Ident.: DSC-46-ATC-10-10-10-00000448.0001001 / 23 APR 14

COCKPIT VOICE RECORDER (CVR)

In addition to its voice recording function, the CVR records the data that the flight crew and the air traffic controller exchange.

Ident.: DSC-46-ATC-10-10-10-00000445.0001001 / 23 APR 14

RADIO MANAGEMENT PANEL (RMP)

Frequencies and telephone numbers that some messages contain, can be loaded into the RMP via the LOAD pb of the RMP.

NOTIFICATION

Ident.: DSC-46-ATC-10-20-00000449.0001001 / 04 DEC 14
Applicable to: ALL

The Notification application enables the flight crew to send a notification message to an ATC center. The ATC center is identified via its ICAO code.

L3 *Note: ATC centers initiate automatic notification when the aircraft flies from one ATC area to another.*

L1 In this notification message, the ATC Datalink system sends all necessary details to the ATC center (flight number, aircraft registration, etc.), in order to enable the ATC center to identify the aircraft, and establish a CPDLC connection between the aircraft and the ATC center.
As soon as an ATC center receives and accepts the notification message, this center is considered as notified.

Note: The notification message does not establish a CPDLC connection between the aircraft and the ATC center. However, the notification is a prerequisite to establish a connection with the ATC center.

The CONNECT page of the MFD:
- Enables the flight crew to enter the ICAO code of the ATC center they wish to notify
- Displays the ICAO code of the notified ATC center and the UTC time of notification, before the connection is established
- Displays the ICAO code of the connected ATC center.

L2 For more information, *Refer to DSC-46-ATC-20-30-20 CONNECT Page*.

Intentionally left blank

GENERAL

Ident.: DSC-46-ATC-10-30-00000451.0001001 / 23 APR 14
Applicable to: ALL

The CPDLC application enables the flight crew and the air traffic controller to communicate.

The CPDLC application supports the following functions:
- Connect (*Refer to DSC-46-ATC-10-30 Connect*)
- Max Uplink Delay (*Refer to DSC-46-ATC-10-30 Max Uplink Delay*)
- Request (*Refer to DSC-46-ATC-10-30 Request*)
- Position Report (*Refer to DSC-46-ATC-10-30 Position Report*)
- Modify Report (*Refer to DSC-46-ATC-10-30 Modify*)
- Other Reports (*Refer to DSC-46-ATC-10-30 Other Reports*)
- Emergency (*Refer to DSC-46-ATC-10-30 EMER*).

Note: *The air traffic controller initiates a CPDLC connection with the aircraft, after reception of the notification message from the flight crew.*

The flight crew and the air traffic controller use a set of predefined messages, also called frames, in order to build their messages. The flight crew and the air traffic controller can also send freetext messages.
The mailbox enables to receive uplink messages and send downlink messages.
L2 For more information about the mailbox, *Refer to DSC-46-ATC-10-70 General*.

L1 Note: *When the aircraft flies from one air traffic control area to another, the CPDLC ensures the automatic transfer of ATC centers.*

CONNECT

Ident.: DSC-46-ATC-10-30-00000452.0001001 / 23 APR 14
Applicable to: ALL

The notified ATC center can initiate a CPDLC connection with the aircraft. This ATC center is then considered as active. Only one ATC center can be active at a time.

L2 Note: *With FANS B, any ATC center can initiate a CPDLC connection, even if the flight crew did not notify the ATC center.*

L1 During flight, the aircraft may move from one ATC area to another. In order to anticipate this change of ATC area, the next ATC center may initiate a passive connection with the aircraft. In this case, the next ATC center appears in the NEXT ATC field of the CONNECT page.
When the ATC area change occurs, the active ATC center ends its connection with the aircraft, and the next ATC center automatically becomes the active ATC center.

The CONNECT page of the MFD displays the ICAO codes of both the active and the next (if any) ATC centers. The flight crew can also manually disconnect the active and the next ATC centers via the CONNECT page.

L2 For more information, *Refer to DSC-46-ATC-20-30-20 CONNECT Page*.

MAX UPLINK DELAY

Ident.: DSC-46-ATC-10-30-00000453.0001001 / 06 NOV 14
Applicable to: ALL

The MAX UPLINK DELAY function enables the ATC Datalink system to reject (without notice to the flight crew) any CPDLC uplink message if the delay between ground emission and onboard reception exceeds the time specified in the MAX UPLINK DELAY field of the CONNECT page.
The air traffic controller defines the value of the MAX UPLINK DELAY. The ground system can automatically uplink the value of the delay in a specific freetext message.
On ATC request, the flight crew must modify the maximum uplink delay value via the CONNECT/MAX UPLINK DELAY page.

CAUTION	Do not enter any value in the MAX UPLINK DELAY entry field unless requested by the air traffic controller.

The flight crew can access the CONNECT/MAX UPLINK DELAY page via the CONNECT page.
L2 For more information, *Refer to DSC-46-ATC-20-30-20 CONNECT/MAX UPLINK DELAY Page*.

REQUEST

Ident.: DSC-46-ATC-10-30-00000455.0001001 / 15 JUL 14
Applicable to: ALL

The flight crew prepares a request via the REQUEST page of the MFD.

In the REQUEST page, the flight crew can:
- Use predefined frames to create a message
- Delete a selected frame from a message

- Insert a reason in the message, with the use of a predefined frame or freetext, as required
- Transfer the created message to the mailbox, before sending it to the ATC center
- Cancel and delete a created message.

The message can contain up to 5 different frames. However, some combinations cannot be done. For example, a climb request and a descent request cannot be inserted in the same message.

L3 Some requests have only one frame:

- Departure clearance
- Oceanic clearance.

Note: *When a departure clearance or an oceanic clearance frame is selected, and if other frames were previously selected, the former ones are lost.*

L1 Requests are part of the CPDLC application, except for departure and oceanic clearances that are part of the A623 application.

L2 For more information, *Refer to DSC-46-ATC-20-30-30 REQUEST Page*.

POSITION REPORT

Ident.: DSC-46-ATC-10-30-00000457.0001001 / 23 APR 14
Applicable to: ALL

The POSITION REPORT function provides the ATC center with information about the aircraft position (past, present, and future position) and trends (climb, descent, heading, track, speed, etc.).

Position reports can be generated:

- Automatically, each time a waypoint is sequenced
  This function is active when the AUTO POSITION REPORT button in the REPORT/AUTO & MANUAL POSITION page of the MFD is set to ON.
- Automatically, following a request of the active ATC center (through a dedicated uplink message)
- Manually by the flight crew, with the REPORT/AUTO & MANUAL POSITION page of the MFD.

L2 Automatic position reports are available, when:

- There is an active ATC center
- The communication between the FMS and the ATC Datalink system is available.

L1 When a position report is automatically generated, it appears in the mailbox. The flight crew can either view and modify the report (on the MFD), or send the report to the ATC center.

L2 *Note:* *The POSITION REPORT function is not available with FANS B.*

For more information, *Refer to DSC-46-ATC-20-30-40 REPORT/AUTO & MANUAL POSITION Page*.

MODIFY

Ident.: DSC-46-ATC-10-30-00000459.0001001 / 23 APR 14
Applicable to: ALL

The MODIFY function enables the flight crew to modify automatic replies that the CPDLC generates, according to specific requests from the air traffic controller.

The CPDLC can generate automatic replies to:
- Confirm requests, or
- Report requests, or
- Open negotiation requests, or
- A combination of the above requests.

The flight crew can modify the reply on the MFD before they send it to the ATC center.
When the flight crew decides to modify a reply, the REPORT/MODIFY page of the MFD displays only the frames that the flight crew can modify.
L3 The flight crew can modify up to 5 frames at a given time.
L1 When the flight crew opens the REPORT/MODIFY page for the first time, all modifiable frames are automatically updated with data from the FMS, as applicable.
All fields are mandatory, except fields with a tick box. These fields are only mandatory when the tick box is ticked.
The flight crew can add a freetext message to the reply, provided that the maximum number of frames in the reply is not reached.
At the end of the modification, the flight crew must click on the XFR TO MAILBOX button in order to transfer the message to the mailbox.
L2 For more information, *Refer to DSC-46-ATC-20-30-40 REPORT/MODIFY Page*.

OTHER REPORTS

Ident.: DSC-46-ATC-10-30-00000461.0001001 / 06 NOV 14
Applicable to: ALL

The air traffic controller may ask the flight crew to report later in flight (e.g. when the aircraft reaches a given altitude, flies overhead a given waypoint, or when back on route).

The FMS Monitoring function allows the monitoring of specific parameters (e.g. a waypoint, or an altitude). This monitoring function allows the ATC Datalink system to automatically generate a downlink message (in the mailbox) when the monitored parameter satisfies the condition.

Note: The FMS cannot monitor the back-on-route situation.

However, the flight crew can also create their own report message in order to inform the ATC about the situation of the aircraft, with the use of the REPORT/OTHER REPORTS page of the MFD.

The REPORT/OTHER REPORTS page enables the flight crew to:
- Use predefined frames to create a report message
  The availability of the predefined frames depends on the active CPDLC connection.
- Add freetext to the report message
- Transfer the report message to the mailbox.

L2 For more information, *Refer to DSC-46-ATC-20-30-40 REPORT/OTHER REPORTS Page*.

MESSAGE RECORD

Ident.: DSC-46-ATC-10-40-00000466.0001001 / 23 APR 14
Applicable to: ALL

The Message Record application stores messages exchanged between the aircraft and the ATC center. The Message Record application enables the flight crew to display the recorded messages at any time.
When the flight crew closes a message displayed in the mailbox, the message is stored and disappears from the mailbox.
The flight crew can access the stored messages via the MSG RECORD page of the MFD.

Note:
1. *The D-ATIS messages are stored and can be displayed on the D-ATIS/RECEIVED page (Refer to DSC-46-ATC-10-50 Digital ATIS).*
2. *The ADS-C reports are not stored.*
3. *The downlink messages that the flight crew did not send are not stored.*
4. *The flight crew can erase the recorded messages (Refer to DSC-46-ATC-20-30-50 ERASE ALL Button).*

GENERAL

Ident.: DSC-46-ATC-10-50-00000469.0001001 / 23 APR 14
Applicable to: ALL

The A623 application supports the following functions:
- Digital ATIS (*Refer to DSC-46-ATC-10-50 Digital ATIS*)
- Departure and Oceanic Clearance Requests (*Refer to DSC-46-ATC-10-50 Oceanic/Departure Request*).

Note: Contrary to the CPDLC application, A623 exchanges do not require previous notification.

DIGITAL ATIS

Ident.: DSC-46-ATC-10-50-00000470.0001001 / 08 NOV 16
Applicable to: ALL

The Digital Automatic Terminal Information Services (D-ATIS) enables the flight crew to request information about airports.

Note: D-ATIS is not available on all airports. Terminal charts usually indicate when this service is available.

The flight crew can request information for departure, destination, and alternate airports via the D-ATIS/LIST page of the MFD.

The flight crew can receive ATIS reports:
- Manually, when they click on the SEND REQUEST button of the D-ATIS/LIST page
  The flight crew then clicks on the UPDATE button to manually update the ATIS information.
- Automatically, when they select the AUTO UPDATE option on the D-ATIS/LIST page.

  Note: The AUTO UPDATE function is not available for departure airport.

The flight crew can read ATIS messages on:
- The D-ATIS/LIST page (*Refer to DSC-46-ATC-20-30-60 D-ATIS/LIST Page*)
- The D-ATIS/RECEIVED page, for the two most recently received messages (*Refer to DSC-46-ATC-20-30-60 Message Area*)
- The printer.
  When the automatic print function is selected, the response is directly sent to the printer.

AUTOMATIC DEPENDENT SURVEILLANCE - CONTRACT (ADS-C)

Ident.: DSC-46-ATC-10-60-00000475.0001001 / 06 NOV 14
Applicable to: ALL

The Automatic Dependent Surveillance - Contract (ADS-C) application provides information reports, without any flight crew action, to one or more ATC centers or AOC centers.
The reports include data like the aircraft position, speed, or the onboard equipment (e.g. TCAS, RNAV capability, RVSM capability).

There are three different types of reports:
- Periodical
- On ATC center request
- On event, through the monitoring of an aircraft parameter (e.g. waypoint sequencing).

The ATC or AOC center can only initiate the ADS-C connection, when the ADS-C status of the aircraft is either “ARMED” or “CONNECTED”.

When at least one ATC or AOC center is connected to the ADS-C:
- The CONNECT page of the MFD indicates the connection status of the ADS-C, and provides a list of all ADS-C connected centers
- The mailbox indicates the number of ADS-C connected centers on the default screen.

A maximum of 5 ATC or AOC centers can be connected to the aircraft at the same time. The flight crew can disconnect one or all ATC or AOC centers. A disconnected center is no longer displayed in the list.
The ADS-C also enables the flight crew to report an emergency situation to the connected ATC or AOC centers, via the EMERGENCY page of the MFD.

L2 For more information, *Refer to DSC-46-ATC-20-30-70 EMERGENCY Page*.

L1 *Note: The ADS-C application does not require any notification, and does not need an active ATC center before any ADS-C reporting.*

L2 For more information, *Refer to DSC-46-ATC-20-30-20 CONNECT Page*.

Ident.: DSC-46-ATC-10-70-10-00000478.0001001 / 04 DEC 14

The ATC mailbox is the dialog interface between the flight crew and the ATC center. Via the mailbox, the flight crew sends downlink messages and receives uplink messages.

There are 10 categories of uplink messages:
- Standard clearances
- Loadable clearances
- Deferred clearances
- A623 oceanic/departure clearances
- Information messages
- Report messages
- Confirm messages
- Negotiation messages
- Open negotiation messages
- No answer messages.

Note: *These categories include the associated answer processing.*
ATIS messages are only available on the D-ATIS page of the MFD (Refer to DSC-46-ATC-20-30-60 D-ATIS/LIST Page).

There are 5 categories of downlink messages:
- Request messages
- Position report messages
- Text messages
- Emergency messages
- Answer messages to ATC requests.

The mailbox can also display system messages. These messages provide information about the current status of the ATC Datalink System.

L2 For more information about these messages, *Refer to DSC-46-ATC-20-60 System Messages*.

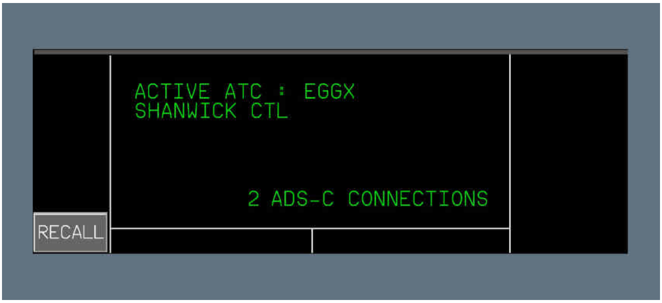
L1 In normal configuration, the mailbox is continuously displayed above the Warning Display on the center upper display unit.

Note: *If the mailbox is not displayed (for example, when a display unit fault occurs), the flight crew will not be informed of an incoming message.*
In this case, the flight crew can use the DISPLAY CYCLE pb to display the mailbox on another display unit, or revert to voice communication.

MAILBOX DISPLAY

When the mailbox does not display any message, a default screen appears and indicates:
- The name of the connected ATC center, when a datalink connection is active
- The name of the NEXT ATC center, if any
- The number of ADS-C active connections, when at least one ADS-C center is connected
- The ADS-C status, when the ADS-C is set to OFF
- The ADS-C EMERGENCY status, when the ADS-C EMERGENCY is activated
- The number of monitored messages, if any.

Mailbox Default Screen



ACTIVE ATC : EGGX
SHANWICK CTL

2 ADS-C CONNECTIONS

The messages are sorted in chronological order. However, urgent messages are displayed immediately.

Other messages are:
- Immediately displayed when there is no other message
- Displayed if the flight crew select them.

Note: *The air traffic controller assigns the level of urgency of the message.*

MAILBOX CAPACITY

Ident.: DSC-46-ATC-10-70-00000479.0001001 / 23 APR 14
Applicable to: ALL

The total capacity of the mailbox is 50 messages.

The mailbox capacity is divided as follows:
- 20 messages for CPDLC:
  - 5 uplink messages that are not answered
    If another message is received, it cannot be inserted in the mailbox, and an automatic downlink message will warn the ATC center that the message is removed because the mailbox maximum capacity is reached.
  - 5 created messages to be sent
    When this limit is reached, the flight crew is no longer able to transfer any new message they created from the MFD to the mailbox.
  - 10 messages not included in the above two categories (for example, messages that the flight crew has not yet closed)
    If an 11th message is added to the mailbox, the oldest one is closed and stored in the MSG RECORD page of the MFD.
- 20 messages for A623 with the same allocation as for CPDLC
- 10 system messages.

MAILBOX COLORS

Ident.: DSC-46-ATC-10-70-00000482.0001001 / 06 MAR 15
Applicable to: ALL

Uplink messages are displayed on a black background, and:

- When received, the message appears in white and the main parameters in blue
- When answered, the message becomes green
- When monitored, a parameter appears in magenta
  If the monitoring fails, this parameter becomes amber.
  When the value is attained, this parameter becomes green.
- If the loading of a clearance in SEC3 failed, the parameters appear in amber.

Downlink messages appear in black:

- On a blue background before they are sent
- On a green background while and after they are sent.

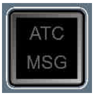
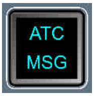
ATC MSG PB

Ident.: DSC-46-ATC-20-70-00000950.0001001 / 23 APR 14
Applicable to: ALL



No message from the ATC center was received.

L12



Flashes when a message from the ATC center is received, or a reminder message is automatically displayed in the mailbox. The reminder message is linked to a deferred clearance or a report request (monitored conditions).
Also flashes in the case of a system message.
Associated with a RING audio indicator.
When the flight crew presses one of the two pushbuttons, the ATC MSG lights go off and the audio indicator is canceled.
For more information, *Refer to DSC-46-ATC-20-90 Audio Indicators*.

L2 The ATC MSG pb lighting and the aural alert are inhibited as follows:

Flight Phase Inhibition

AUDIO INDICATORS

Ident.: DSC-46-ATC-20-90-00018285.0001001 / 23 APR 14
Applicable to: ALL

Audio Indicators	Condition	Duration
Ring (Sound)	A message is received in the mailbox, or a monitored condition is satisfied.	Sounds: - Immediately and is repeated every 5 s in case of an urgent message (1), or - After 10 s and is repeated every 10 s in case of a normal message (1). Stops when the flight crew: - Presses one of the two ATC MSG pb, or - Uses the KCCU to manage the message in the mailbox (e.g. when the flight crew writes an answer or prints the message).

(1) *The air traffic controller can assign two levels of alerts depending on the urgency of the message.*

Intentionally left blank

KCCU

Applicable to: ALL

Ident.: DSC-46-ATC-20-80-10-00000951.0001001 / 23 APR 14

There are two KCCUs on the center pedestal. There is one for the Captain and one for the First Officer.
For information about all KCCU controls, *Refer to DSC-31-CDS-100-20 Overview*.

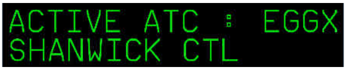
CONNECTION STATUS INDICATION



ACTIVE ATC : EGGX
SHANWICK CTL

Indicates the ATC center connected with the aircraft.

Ident.: DSC-46-ATC-20-60-10-00000900.0001001 / 23 APR 14

ADS-C CONNECTED CENTERS INDICATION

ADS-C OFF

The ADS-C is OFF.

2 ADS-C CONNECTIONS

Indicates the number of ADS-C connected centers.

Note: The ADS-C status is not displayed on the mailbox when the ADS-C is ARMED.

Ident.: DSC-46-ATC-20-60-10-00000908.0001001 / 23 APR 14

TIME

Indicates the UTC time at which:
- The ATC center sent the uplink message
- The flight crew sent the downlink message to the ATC center.

Note: If the time at which the ATC center sent the message is not available :
- *No time indication appears in the time area*
- *The RECEIVED AT XXXXZ indication appears at the end of the message, where XXXX is the time at which the uplink message is received.*

Following a clock failure, the time area is:
- *Empty if no time indication was previously available, or*
- *Completed with ----Z.*

Ident.: DSC-46-ATC-20-60-10-00000909.0001001 / 23 APR 14

DESTINATION/ORIGIN ATC CENTER

LFBO

Indicates the active ATC center that sent or received the message.

Ident.: DSC-46-ATC-20-60-10-00000915.0001001 / 04 DEC 14

MESSAGE STATUS

The status of a message corresponds to the type of response that the flight crew selected on the mailbox (except for the status OPEN, OPEN, and ABORT).

AFFIRM

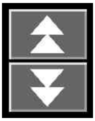
The flight crew clicked the AFFIRM button of the mailbox, in order to answer positively to the ATC uplink message.

NEGATIVE	The flight crew clicked the NEGATIVE button of the mailbox, in order to answer negatively to the ATC uplink message.
ROGER	The flight crew clicked the ROGER button of the mailbox, in order to inform the ATC center that they received and understood the uplink message.
STANDBY	The flight crew clicked the STANDBY button of the mailbox, in order to inform the ATC center that they need time to answer the uplink message.
UNABLE	The flight crew clicked the UNABLE button of the mailbox, in order to inform the ATC center that they cannot comply with the request.
WILCO	The flight crew clicked the WILCO button of the mailbox, in order to inform the ATC center that they understood the request and that they will comply with it.
ACK	The flight crew clicked the ACK button of the mailbox, in order to acknowledge a departure/oceanic clearance.
L12 REFUSE	The flight crew clicked the REFUSE button of the mailbox, in order to refuse a departure/oceanic clearance. The message CONTACT ATC BY VOICE - REFUSE NOT SUPPORTED - BY DATALINK appears in the information messages area of the mailbox, in order to inform the flight crew that they must use voice to refuse the clearance.
OPEN	Indicates that the received uplink message requires a response. The status OPEN remains until the flight crew answers the uplink message.
OPEN	Indicates that: - The flight crew did not answer the uplink message in due time, or - The flight crew sent a downlink or a response message, but no acknowledgment from the ground was received.
ABORT	Indicates that a disconnection occurred during a pending uplink or downlink message.

Note: *When the flight crew selects a response from the mailbox and clicks on the SEND button, the status appears in black on a green background.*
The status is empty for a downlink message sent to the ATC center or an uplink message which does not require any answer.

Ident.: DSC-46-ATC-20-60-10-00000918.0001001 / 23 APR 14

NEXT/PREVIOUS PAGE BUTTONS



When clicked, displays the next/previous page of the message when the message length is more than one page.

Note: *The flight crew can scroll through the multiple pages of a message with the scroll wheel of the KCCU.*

Ident.: DSC-46-ATC-20-60-10-00000920.0001001 / 23 APR 14

PAGE NUMBER INDICATION

Indicates the page number of the current displayed page of the message.
When the message contains only one page, no information appears.

Note: *An answer to an uplink message can only be sent after the flight crew displayed its last page.*

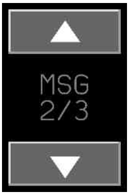
Ident.: DSC-46-ATC-20-60-10-00000925.0001001 / 23 APR 14

MESSAGE NUMBER INDICATION

Indicates the rank of the displayed message.
When there is only one message in the mailbox, no information appears.

Ident.: DSC-46-ATC-20-60-10-00000948.0001001 / 23 APR 14

NEXT/PREVIOUS MESSAGE BUTTONS



When clicked, displays the previous/next message.
When there is only one message in the mailbox, no button appears.

Ident.: DSC-46-ATC-20-60-10-00000897.0001001 / 23 APR 14

PRINT BUTTON

When clicked, prints the message that is currently displayed in the mailbox.

Ident.: DSC-46-ATC-20-60-10-00000949.0001001 / 23 APR 14

RECALL BUTTON

When clicked, recalls the message that the flight crew most recently removed from the mailbox with the CLOSE button.

Note: *A recall is only possible within 5 min after the closure of the message. After 5 min, on selection of the recall command, the following message is displayed: RECALL EMPTY, CONSULT MSG RECORD.*

Ident.: DSC-46-ATC-20-60-10-00000902.0001001 / 04 DEC 14

COMMUNICATION BUTTONS

Depending on the nature of the message, the system automatically displays the appropriate communication buttons. The possible communication buttons are detailed below.

WILCO BUTTON

When clicked, prepares a response message to comply with an ATC clearance.

ROGER BUTTON

When clicked, prepares a response message to confirm reception and understanding of an ATC information or report request.

AFFIRM BUTTON

When clicked, prepares a response message to send a positive answer to a negotiation message from the ATC center.
A negotiation message is a question of the type CAN YOU ACCEPT [altitude] AT [position, or time].

ACK BUTTON

When clicked, prepares a response message to accept a departure/oceanic clearance.

SEND BUTTON

When clicked, sends a downlink message. The message can be a system message (e.g. auto position report) or a response that the flight crew prepared via the other command buttons (WILCO, ROGER, STANDBY, etc.).
When a downlink message is in the mailbox but includes more than one page, the SEND button is not active until the flight crew displayed all pages (with the page up and page down buttons).

CLOSE BUTTON

When clicked, closes and removes from the mailbox a message that the flight crew sent to the ATC center, or a message from the ATC center that the flight crew answered. The closed message is stored and can be displayed via the MSG RECORD page of the MFD. This is not applicable when the answer is on standby.

Note: *Some messages are automatically closed 2 s after a successful downlink. For these messages, the CLOSE button is not available.*

STANDBY BUTTON

When clicked, prepares a response message to inform the ATC center that the flight crew needs to delay the answer.
With a FANS B connection, the flight crew has 100 s to answer a message from the ATC center. If the flight crew clicks the STANDBY button before the 100 s have elapsed, the countdown resets.

CANCEL BUTTON

When clicked:
- Removes a prepared downlink message from the mailbox and clears the MODIFY page of the MFD where the message was prepared, or
- Cancels a selected reply to an uplink message.

CANNOT BUTTON

When clicked, prepares a response message to send a negative answer to an open negotiation message from the ATC center.
An open negotiation message is a question of the type WHEN CAN YOU ACCEPT [altitude, speed, or offset].

REFUSE BUTTON

When clicked, prepares a response message to send a negative answer to a departure/oceanic clearance.

UNABLE BUTTON

When clicked, prepares a response message to reject an ATC clearance.

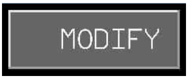
NEGATIVE BUTTON

When clicked, prepares a response message to send a negative answer to a negotiation message from the ATC center.
A negotiation message is a question of the type CAN YOU ACCEPT [altitude] AT [position, or time].

DUE TO BUTTON

When clicked, enables the flight crew to add a justification (due to aircraft performance, weather, ...) for a NEGATIVE or UNABLE response.

MODIFY BUTTON



When clicked, displays the MODIFY page on the MFD, to enable the flight crew to modify a preset message from the FMS. Also used to update the parameters that the FMS or SURV provides to the mailbox.

REFRESH BUTTON

When clicked, updates the downlink FMS data on the mailbox.

LOAD→SEC3 BUTTON

When clicked, loads a clearance received from the ATC center in the FMS.

Note: *When there is a flight plan in SEC 3, this flight plan will be deleted when the ATC flight plan is uploaded.*
